At the close of the war he undertook cotton planting in Mississippi. This venture, however, proved disastrous, droughts and malaria ruining him in health and purse. Coming north in '67, he secured a place with the wholesale drug house of H. Dailey & Company, in Indianapolis, having charge of the little laboratory and the filling of certain kinds of orders. In 1869 he formed a co-partnership with Mr. James Binford, of Crawfordsville, Indiana, and opened a retail store in Paris, Edgar County, Ill., under the firm name of Binford & Lilly. This store still exists under the name of the Binford Drug Company. This proved a successful venture and gave him a small amount of capital with which he joined with Dr. John F. Johnston, as previously stated, and formed the manufacturing pharmaceutical concern of Johnston & Lilly, in Indianapolis, in 1873. In 1876 Mr. Lilly withdrew from the firm of Johnston & Lilly and established his own business under his own name, as sole proprietor. The Johnston & Lilly establishment continued for some years under the name of John F. Johnston, but was eventually discontinued. The business of Eli Lilly prospered from the beginning and in 1878 larger quarters were secured. In 1880 it was incorporated as a stock company, the stock other than Mr. Lilly being held by his brother, James E. Lilly, and other members of the family. The growth of this and other concerns now in Indiana has been along parallel lines with the establishment and development of concerns in other States and is not particularly worthy of notice other than they may deserve no mean place in the great development of manufacturing pharmacy in the United States since the Civil War.

One accomplishment in which the Lilly concern took some satisfaction in the earlier years was the invention of the first process by which pills could be coated with gelatin without the necessity of impaling each pill on the end of a needle. This process is being shown in your historical exhibit and will not be elaborated upon here. Since then other and better methods have been devised by others and are in general use.

Another accomplishment was a line of assayed fluid extracts, being the first to be introduced under that name and a part of the small beginnings of the now

generally adopted plan of standardization. The lines covered by Indiana concerns are in concert with others of like nature, constantly broadening until including almost everything in a pharmaceutical and biological way.

The next concern to appear in Indiana along manufacturing lines was the McCoy-Howe Company, of Indianapolis, established in 1892. This concern has grown to large proportions and supplies a generous line of products to the physicians of Indiana and adjoining States. From time to time other houses have been established until to-day we have in Indiana the following active concerns:

Central Pharmacal Co., Seymour, Ind.

Lafayette Pharmacal Co., Lafayette, Ind.

Frank S. Betz Co., Hammond, Ind.

C. M. Bundy Co., Indianapolis (Specializing in compressed tablets and pills).

Pitman-Moore Company, Indianapolis (Also producers of hog cholera serum in a very large way).

Swan-Myers Company, Indianapolis.

Swan-Williamson Company, Indianapolis.

Eli Lilly & Company, Indianapolis and Greenfield.

The writer was recently delegated by Governor Goodrich, through Dr. Chas. P. Emerson, Chairman of the Medical Section of the State Council of Defense, to make a survey of the pharmaceutical and biological resources of the State of Indiana. Calling together representatives of all the houses, this survey was made and reported to the State authorities. The information secured by this survey was a revelation to even those of us who should have been informed. It is quite possible that the output of pharmaceuticals of this State is only exceeded in volume by but one other State in the Union. We discovered that the total annual output of these houses, when based on most conservative figures, exceeded anything of which we had thought—if we had thought at all. It was found that liquid preparations of various kinds were supplied in amounts approximating five million pounds annually. That in the matter of compressed tablets of various kinds and uses, the units would approach the number of dollars in the first Liberty Loan. We found an output of empty gelatin capsules exceeding a half billion, and other things in proportion. Realizing fully that quantity is not a criterion of success and usefulness, it was gratifying to find all establishments observing the latest methods of scientific standardization and a general air of enterprise and progress throughout the guild.

It would seem that this brief account of manufacturing pharmaceutical progress in Indiana would hardly be complete without the mention of the industry devoted to the collection of crude drugs. Indiana has always been a great State for ginseng and hydrastis, although the supplies of both of these have now become nearly exhausted. At Madison, Ind., Sulzer Brothers have for many years conducted a large business in this line. Their supplies come from Southern Indiana, Kentucky, Tennessee and other points south of the Ohio River. They supply not only Indiana manufacturers but those located in other States and also ship quantities abroad. It is quite possible that in this concern Indiana has the largest facilities for supplies of native drugs.

Manufacturing pharmacy in Indiana is also well supplied in the matter of alcohol, as we are in the corn belt and we have distilleries of great capacity for the manufacture of this essential solvent and preservative.

Again, we are well served in the matter of bottles, having a number of excellent plants for the manufacture of this indispensable item.

A little start has been made in the matter of drug culture, in both an experimental and commercial way.

Another factor of great importance in the development of the drug business in Indiana is the fact that since the early day the State has had an excellent system of wholesale distribution by houses in Indianapolis, Ft. Wayne, Terre Haute, Evansville, and Richmond. Today there are seven wholesale drug houses serving the retail druggists of Indiana and portions of Ohio, Illinois and Kentucky. This is a fewer number than existed in former years, but the volume of business handled is much greater and the service constantly improving.

I would not like to close this paper without a mention of some of the pioneers in the wholesale drug business, which is so closely allied and so essential to the retailer and the manufacturer.

Mr. Augustus Kiefer was one of the pioneers of the modern wholesale drug guild entering the business in 1872 in Indianapolis, and when he passed away a few years ago he left one of the most thoroughly organized institutions in the United States.

Mr. Daniel Stewart, another pioneer, came to Indianapolis in the early day from Decatur County, forming the firm of Stewart & Barry, which finally became the Daniel Stewart Company, doing business in a large and efficient manner.

Recently these two concerns have merged into the Kiefer-Stewart Company.

Another old firm in service was Ward Brothers, of Indianapolis, the surviving member of that firm being Mr. Marion Ward, now of the Mooney-Mueller-Ward Company, which concern has a large and useful plant, being a merging of the interests of Mooney-Mueller Drug Company and Ward Brothers Drug Company.

E. H. Bindley & Company and Cook, Black & Hoffman, of Terre Haute, are also pioneer houses.

Chas. Leich & Company, Evansville, date back many years and have served that section of the State and Kentucky acceptably.

A. G. Luken & Co., of Richmond, supply a certain section of Eastern Indiana and Western Ohio.

The youngest member of the guild is the Ft. Wayne Drug Company, that splendidly serves the northeast section of Indiana with portions of Ohio and Michigan.

With all of these interests working harmoniously together to serve that which is best in medicine and pharmacy, it would certainly seem that there is comparatively little left to be desired other than a continuation of scientific and commercial growth.

Altogether, those of us who have been a part of this development in our Hoosier State may possibly be pardoned for expressing a degree of satisfaction in the development of manufacturing pharmacy in Indiana in the last generation.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

CINCINNATI.

Fifth Annual Report of the Secretary, Charles A. Apmeyer:

The session 1917-18 opened with a meeting held at the Cincinnati College of Pharmacy Building, October 9, 1917, President Louis Werner presided.

After the Secretary had read the full report of the May 8th meeting, the last meeting of the preceding session, and mentioning the sad bereavements this branch sustained during the interim to the opening of the 1917-18 session, all of which report was duly approved; Mr. Julius Greyer, Treasurer, made a statement regarding the financial condition of this branch, stating in part: Our branch has done a great deal of good in the past and it will do more the coming season, if sufficiently encouraged. Our meetings have been most interesting, beneficial and instructive to all who attended them, and every pharmacist, whether member of the branch or not, is welcome and should avail himself of the privilege and attend our meetings. Again—our present by-laws call for only 50 cents' dues, which are absolutely insufficient to meet even the most necessary expenses, and this is a great hindrance to the promotion of any move on the part of the officers, by which interesting and instructive material for our meetings might be secured.

At this meeting Prof. C. T. P. Fennel presented his masterly lecture on "Pharmacology—Pharmacy of Today." Prof. Fennel states that Pharmacology is really a modern term, and does not mean alone Pharmacy, but according to the Pharmaceutical Syllabus, recommended by the National Committee, representing the Boards and Schools of Pharmacy of the United States, includes Materia Medica, Botany, Chemistry, Pharmacy, Physics, Arithmetic, Latin, as well as Pharmacognosy, Toxicology, Posology and Biology, not omitting even Commercial Training in its

curriculum. Prof. Fennel expresses himself frankly as concerns the advancements and changes that have been made in the direction of pharmacy, including Pharmacology and its connection with medicine in general. He calls attention to the fact that the old time compounds have been practically displaced through the changes that have taken place in medical education. He shows how insidiously and irresistibly the practice of Pharmacy has undergone a revolution and that the pharmacists of the olden time have been practically relegated to obscurity, very few now being in a position to make a living by old-time processes and methods.

This same lecture was continued by Prof. Fennel at the November meeting, held at the Hotel Gibson. He again pointed out the danger to the pharmacist of being almost entirely alienated from his pharmaceutical manipulations and efforts, greatly due to the energetic progressive processes employed by the manufacturing pharmaceutical houses. Pharmacy is gradually drifting away from us; the medical profession has been efficient in teaching her institutions to live up to requirements; the pharmaceutical profession, however, has become so governed and legalized, either by U. S. P. or N. F. standards and National Pharmaceutical Syllabus, that these very standards set forth seem almost to be a bar to higher educational or manipulative processes, for outside of pharmacy there is not a single other science which is restricted by a legal standard.

Hon. Frank H. Freericks chose for his subject: "The New Income Tax, and the Sale, Taxation and Use of Non-Beverage and Special Denatured Alcohol." Mr. Freericks presented the provisions of the New Income Act by means of discussion, charts and questionnaire, efficiently instructing his attentive audience in the various obligations of this new law.

The principal speaker at the December meeting was Prof. Theo. D. Wetterstroem, who presented a very interesting and instructive report of Comments on the U. S. P. and N. F., same being greatly appreciated by the members.

Dr. E. P. Zeumer delivered a highly interesting lecture at the January meeting, which was held at the offices of the American Drug-gists' Fire Insurance Company. Dr. Zeumer's lecture was illustrated by stereopticon views, the subject being "The Manufacture, Preparation and Uses of Antitoxins and Serums." An abstract of this lecture was published in the JOURNAL. (See January issue JOURNAL, p. 184.)

At the February meeting your Secretary called attention to the fact that this branch now celebrates its fifth anniversary, saying: On February 12, 1913, seventeen gentlemen of the pharmaceutical profession assembled at Lloyd's Library to form a Cincinnati Branch of the A. Ph. A. The professional, the medical, the manufacturers', as well as the retail drug-gists' interests were represented, and met in an earnest desire to further the objects of the American Pharmaceutical Association, which are: To advance the science and art of pharmacy, and to improve the condition of pharmaceutical practice by stimulating research and the development of improved methods, by diffusing scientific and technical knowledge, by fostering sound pharmaceutical education, by upholding the dignity of pharmacy and demonstrating to the public its importance and the necessity as a matter of public safety, of restricting pharmaceutical practice to trained pharmacists, by extending the field of usefulness of the pharmacist to the people, by promoting the enforcement of due observance of established standards for the identity, purity and strength of medicines, by aiding in the suppression of empiricism, in the regulation of the use of dangerous and habit-forming drugs and in the protection of the public health; by maintaining respect for ethical standards in the practice of pharmacy; by promoting relations of comity and mutual respect between physicians and pharmacists; in short in all proper ways to promote the true welfare of Pharmacy and Pharmacists.

I believe that the Cincinnati branch has so far fulfilled its mission, and with the further support and endeavor of our members much good may be accomplished to the credit of

not only the Cincinnati branch but also of the parent body.

The members were instructively entertained at the March meeting by E. V. Kyser, Ph.G., whose lecture—"Importance of the American Crude Drug Industry"—was well received, and at its conclusion led to interesting discussions. Dr. Kyser says: The American Drug Flora is very large and widely distributed; there are several hundred varieties of drug plants of therapeutic value growing wild in the United States. The growing of drugs as ornaments, the cultivation of wild drugs for personal and commercial purposes has been prevalent since the early colonization. The diversity and importance of our Flora led many of the European Governments to send patrons to this country, who made explorations of our Eastern States during the latter part of the 18th and the early part of the 19th century. Among those early visitors were many eminent botanists, who contributed largely to valuable books on American plants. Their writings were on the general Flora, but contained much of interest concerning medicinal plants.

Andre Michaux, under the patronage of the French Government, during his several years of exploration sent back to Europe over 2500 specimens of trees, shrubs and plants.

Mr. Fraser, a Scotchman, under the patronage of the Russian Government, did much work on our Flora.

Mr. John Lyon, of Great Britain, was an enthusiastic collector of our plants and contributed many of our species to the English Gardens.

F. A. Michaux, son of Andre, traversed the Eastern States, the result of his work being found in his "The Forest Trees of America."

Thomas Mitchell, an Englishman, contributed largely to the discovery and elucidation of the Flora of North America.

The Standard Supply Table of the indigenous plant remedies for field and sick in General Hospitals consists of 70 drugs of recognized therapeutic value, many of which are official drugs in the present and former pharmacopoeias.

The April meeting was partly devoted to a business meeting, after which the President called upon Dr. C. T. P. Fennel, who delivered a very interesting lecture on Pharmacology, giving and enumerating the vast number of products that may be obtained

by the destructive distillation of wood, and shows how by fractional distillation at the various degrees of heat the many products are separated, such as pyroligneous acid, acetone, etc. He then took up the coal distillation, showing the formation and separation of the numerous products, such as the various bitumen pitch residues, crude oil, carboic acid, benzene, anthracene, naphthalene, etc. A very interesting part of the Doctor's lecture is the presentation of samples of the progressive distillates obtained by him.

The branch now has a membership of 58. We had the misfortune of losing one of our good members, Mr. Rudolph C. Fack, whose death occurred March 12, 1918.

A pleasing incident during the session 1917-18 is the appointment of member Dr. C. T. P. Fennel to the Professorship of Materia Medica at the University of Cincinnati.

CHAS. A. APMEYER, *Secretary*.

May 21, 1918.

The annual election of officers of the Cincinnati Branch, A. Ph. A., took place at Lloyd Library, May 21, 1918: *President*, Louis Werner; *First Vice-President*, Frank H. Freericks; *Second Vice-President*, Bertha Ott; *Treasurer*, Dr. Frank Cain; *Secretary*, Charles A. Apmeyer; *Member Executive Committee*, E. H. Thiesing.

After installation of officers a spirited discussion took place regarding the furnishing to the soldier and sailor better pharmaceutical service, of eliminating as much as possible the tin-canned medication now furnished to our forces, the possible establishment of true pharmacies at cantonments in connection with Y. M. C. A., Red Cross, Knights of Columbus, and similar humanitarian efforts, all of which discussion finally led to the adoption of the following resolution.

CHAS. A. APMEYER, *Secretary*.

Resolution offered by Mr. Frank H. Freericks at the May 1918 Meeting of the Cincinnati Branch of the A. Ph. A. and adopted by a unanimous vote:

The Cincinnati Branch of the A. Ph. A. convinced;

That, the health and life of the nations young men in the Army require medicine freshly prepared which can be supplied them only through a staff of men pharmaceutically trained;

That, the medical staff of our Army, now includes thousands of physicians taken from

civil life, whose successful treatment of disease has been dependent upon prescribing medicines extemporaneously and freshly prepared, who will be greatly hindered if confined to the use of a restricted list of so-called "Canned Medicines;"

That, The Congress seems unimpressed with the immediate need for establishing a Pharmaceutical Corps in our Army as found necessary by nearly all other Nations, possibly controlled in its lack of action by the opinion of Army Medical Men whose experience has been restricted to the use of manufactured medicines in our heretofore limited Army requirement and on that account without sufficient knowledge of the advantage, need and superiority of freshly and extemporaneously prepared medicines as secured in civil life, therefore

Resolves, to request the National Pharmaceutical Service Association, the National Association of Retail Druggists and the American Pharmaceutical Association, to confer through representatives of retail pharmacy and with officials of the organizations herein-after named upon the feasibility of establishing completely equipped pharmacies in charge of a staff of qualified pharmacists in connection with Y. M. C. A. and K. of C. Army Establishments, through the patriotic self sacrifice of pharmacists, supported by the relatives and friends of the young men now in the service of their country, to the end that they may not suffer and die for the want of proper medication and so that this voluntary experience may at once serve to satisfy the authorities of the need for complete pharmaceutical equipment and properly trained pharmacists in our Army.

DETROIT.

The regular meeting of the Detroit Branch of the American Pharmaceutical Association was called to order in the Wayne County Medical Bldg., May 17th, President Kimmich presided. The minutes of the last meeting were read and approved. A letter was read from D. J. Coleman, Ensign U. S. N. R. F. Officer in Charge United States Navy Recruiting Station, asking the Detroit Branch to assemble to meet Col. Theodore Roosevelt and to participate in the Memorial Day parade, May 30th. A motion was made that the Secretary write a letter to Dr. Coleman saying that on account of the nature of our organization that we could not participate. The

treasurer's report was read and accepted. A motion was made and carried that the secretary write a letter of thanks to Fred'k Stearns & Co., in recognition of the appreciation of the branch for their kindness in contributing the printing necessary for the year's work. A motion was made and carried that \$10.00 be given to Mr. Nelson, the steward of the Wayne County Medical Bldg., as a token of appreciation of his services. A motion was made and carried that the September meeting for the year 1918 be omitted. A motion was presented in writing by E. R. Jones that the By-Laws be amended to read "Meetings to be held from October to May of each year inclusive." Since this necessitates a changing of the By-Laws, the motion was laid on the table until the October meeting, at which time action will be taken. The Nominating Committee made the following report:

President—E. R. Jones, *Vice-President*—G. M. Schettler, *Secretary*—May Strawn, *Treasurer*—Chas. F. Mann, *Chairman of the Program Committee*—G. M. Grommet, and *Councilor*—L. A. Seltzer.

A motion was made that the report of the nominating committee be accepted. Carried. Nominations were asked from the floor and a motion was made and seconded that nominations be closed. Carried. A motion was made and carried that the rules be suspended and the secretary authorized to cast an unanimous ballot for the names as presented by the nominating committee.

A motion was made that the branch go on record as favoring the Edmonds bill and the secretary send all the representatives and senators of the state of Michigan a letter to this effect. Carried.

Miles Turpin, General Sales Agent of the Todd Protectograph Co., gave an interesting talk on check protection as carried out by the system which is put on the market by his company. The complete outfit includes a machine and special paper which protects the name of the person whose signature is appended to the check, as well as the amount to be paid. Since the laws of the United States say that a person must pay all that is above his signature on a check he called attention to the fact that a man who has a small capital needs protection even more than large concerns who can charge occasional losses to Profit & Loss. W. A. Hall, Ph.B., presented some interesting and unusual prescriptions to the members present for their comments

as to the best method of compounding. This created quite a little discussion. A motion was made and carried that a vote of thanks be extended to the speakers and that a vote of appreciation be extended to Dr. Stevens in recognition of his interest in the branch and his attendance at the meetings.

The retiring president, Mr. Kimmich, gave a short talk in appreciation of the cooperation extended to him by the members of the branch and formally turned the office over to the new president, Mr. Jones, who gave a short inaugural address.

MAY E. STRAWN, *Secretary*.

PHILADELPHIA.

The last monthly meeting of the 1917-1918 sessions of the Philadelphia Branch of the American Pharmaceutical Association was held at the Philadelphia College of Pharmacy on May 20th, with President McNeary in the chair. Due to the extent of the proposed program, business matters were hurried through and the guest of the evening, Dr. A. R. L. Dohme of Baltimore invited to explain his tentative plan for the federation of all pharmaceutical associations.

Dr. Dohme's able presentation was very well received and while many had come to listen with biased minds there was no one who found in the well-thought-out talk, anything which might be called impracticable or impossible. Before the meeting there were those who said that Arcadia was a fine place to dream about but that we were not to forget that we still live on old mother earth. These same persons after the close of the meeting argued that if the plan ever came to pass Pharmacy would probably come into its own. There is hardly the need to review Dr. Dohme's plan, since it has been given much publicity through the journals. It was very clearly pointed out by the speaker that the plan proposed was simply formulated in order to give a basis to work upon and that there would be the necessity, no doubt, of reconstructing and altering a good portion of it. A good start is a race half won was the axiom upon which the President of the A. Ph. A. worked and while he felt that it would take years for the plan to mature he had no doubt that with cooperation of all concerned the proposition could be carried out to a successful conclusion and Pharmacy through it would take a new hold on society and assume its rightful "place in the sun."

Dean Lawall, leading the discussion of the address said in part that he fully agreed with the speaker as to the need for this federation and the advantages accruing from such a step forward. He also felt that the process of amalgamation would require time and the sincere coöperation of all pharmaceutical interests. He stated that the best plan would probably be one that would not be too radical and one which would be comprehensive but which should be given plenty of time to develop. It was suggested that plans should be made for arranging to have all the associations meet at the same time and at the same place one of the next few years and in this way start things going harmoniously. The service bureau outlined by Dr. Dohme was an excellent idea, stated Dean Lawall and could be elaborated so as to include any service which might be helpful to the pharmacist. Other speakers were Dr. Sturmer, Prof. Fischelis, Dr. Stewart, Dr. Lowe, E. G. Eberle and J. W. England. Mr. England moved and E. G.

Eberle seconded that the thanks of the Branch be extended to Dr. Dohme for his excellent presentation and the motion was duly approved by a rising vote.

Professor Gershenfeld of the faculty of the Philadelphia College of Pharmacy then read a very interesting paper on "Bacteriology and Its Relation to Pharmacy." He pointed out the very important fact that pharmacists with their chemical training were better equipped as bacteriologists than the average physician and that there was a wonderful field in the practice of this science for the young pharmacist who wishes to work along professional lines. The history of the science was carefully outlined from its humble start to the limitless boundaries which it has reached at the present time. The paper was discussed by Professors Stroup and Sturmer. The meeting was probably the most successful and interesting of the season and well attended.

IVOR GRIFFITH,
Secretary.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 15.

PHILADELPHIA, May 14, 1918.

To the Members of the Council:

Motion No. 22 (Approval of Program for 1918 Annual Meeting) has received a majority of affirmative votes. The Committee on Program asks that the Council Meeting scheduled for 7.00 P.M., Thursday be changed to 5.00 P.M., and the second general session of the Association be changed from 8.00 P.M. to 8.15 P.M. This will give time for an illustrated lecture by Dr. H. H. Rusby, entitled "The Indications of Medicinal and Poisonous Properties in Plants" at 7.30 P.M. to 8.15 P.M. If there are no objections these changes in the program will be made.

Motion No. 23 (Election of Members: applications Nos. 115 to 133 inclusive) has received a majority of affirmative votes.

Motion No. 24 (Approval of Award of a Joseph P. Remington Medal by New York Branch). Moved by Jeannot Hostmann, seconded by H. V. Arny, that the Council grant the request of the New York Branch for the consent and moral support of the parent organization in the awarding of the proposed Joseph P. Remington Medal (C. L. No. 14).

Motion No. 25 (Election of Members). You

are requested to vote on the following applications for membership:

- No. 134. Paul Hapke, U. S. S. Brooklyn, care Postmaster, San Francisco, Cal., rec. by Wm. B. Day and J. F. Rupert.
- No. 135. Edmund D. Pinter, 100 Danforth Ave., Jersey City, N. J., rec. by Hugo H. Schaefer and Wm. B. Day.
- No. 136. Charles J. Chapman, 62 Maiden Lane, New York City, N. Y., rec. by Hugo H. Schaefer and Wm. B. Day.
- No. 137. John F. Matthes, 14 N. Franklin Street, Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 138. M. M. Taylor, 602 Franklin Street, Tampa, Fla., rec. by Ernest Berger and Wm. B. Day.
- No. 139. Brna Clifford Goodhart, 239 S. 11th Street (Locust), Phila., Pa., rec. by Franklin M. Apple and W. Wilson McNeary.
- No. 140. Oscar Dowling, La. State Board of Health, New Orleans, La., rec. by R. F. Grace and Edw. H. Walsdorf.
- No. 141. Oscar Baker Elmer, 540 Magazine Street, New Orleans, La., rec. by R. F. Grace and Adam Wirth.

- No. 142. Earl A. Means, 281 Greene Ave., Brooklyn, N. Y., rec. by Hugo H. Schaefer and Turner Currens.
- No. 143. William R. Jackson, 281 Greene Ave., Brooklyn, N. Y., rec. by Hugo H. Schaefer and Turner Currens.
- No. 144. Antonio Gavalda y Milanes, 38 Marti, Artemisa, Cuba, rec. by Jose G. Diaz and Jose P. Alacan.

J. W. ENGLAND,

415 N. 33RD STREET.

Secretary.

Treasurer Whelpley submits the following data: *Resigned since April 2, 1918:* Mrs. A. P. Clark, 124 S. Beach St., Daytona, Fla.; A. L. Stroup, 1436 Cypress St., Pueblo, Colo.; J. C. Palmer, The Dalles, Ore.; B. C. Steves, 48 W. 130th St., New York, N. Y.; and A. E. Lathrop, P. O. Block, Main Street, Simsbury, Ct.

A. PH. A. COUNCIL LETTER NO. 16.

PHILADELPHIA, June 1, 1918.

To the Members of the Council:

Motions No. 24 (Approval of Award of Joseph P. Remington Medal by New York Branch) and No. 25 (Election of Members; applications Nos. 134 to 144 inclusive) have each received a majority of affirmative votes.

Motion No. 26 (Election of Members). You are requested to vote on the following applications for membership:

- No. 145. José E. Fernandez y Valdez, Santa Clara, Cuba, rec. by Philip Asher and Wm. B. Day.
- No. 146. W. Clifford Raynor, Westhampton, N. Y., rec. by William C. Anderson and Archie P. Lohness.
- No. 147. George Casper Deffaa, 168 East 66th Street, N. Y. City, N. Y., rec. by Hugo H. Schaefer and Jeannot Hostmann.
- No. 148. Grace Irene Harper, 19 W. 101st Street, New York, N. Y., rec. by H. V. Army and May Agnes O. C. Davis.
- No. 149. Mendel Zagat, Prospect Ave. and 156th Street, Bronx, New York, N. Y., rec. by Hugo H. Schaefer and Jeannot Hostmann.
- No. 150. George W. Pegg, 113 W. 18th Street, New York, N. Y., rec. by L. E. Warren and W. S. Hubbard.
- No. 151. Conrad Edward Langfield, Northville, Mich., rec. by Frank L. McCartney and Turner F. Currens.

- No. 152. Morris Adoff, 546 Claremont Parkway, Bronx, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 153. Max Bergman, 1570 Bathgate Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 154. Isaac Berniker, 1735 Washington Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 155. Benjamin Billig, 4003 Third Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 156. James Cecaletto, 301 East 150th Street, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 157. Simon Doniger, 79 Sherman Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 158. Irving A. Edelstein, 1728 Crotona Park East, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 159. Bernard Eohs, 2403 Walton Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 160. Isadore Flomenbaum, 1129 Vyse Ave., Bronx, N. Y. City, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 161. Henry Frank, 2071 Vyse Ave., Bronx, N. Y. City, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 162. Louis Friedman, 668 Teuton Ave., Bronx, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 163. Joseph Greenberg, 1047 Teller Ave., New York City, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 164. Samuel Morriss Goodman, 131 Spruce Street, Newark, N. J., rec. by Jacob Diner and Gustave Horstman.
- No. 165. Max M. Hager, 1484 Hoe Ave., Bronx, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 166. Max Heinovitch, 1078 Stebbins Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.

- No. 167. David Israel, 1037 Teller Ave., New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 168. Joseph Robert Kerr, 500 W. 172nd Street, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.
- No. 169. Julius Kerr, 500 W. 172nd Street, New York, N. Y., rec. by Jacob Diner and Gustave Horstman.

CORRESPONDENCE

ST. LOUIS, MO., May 25, 1918.

THE EDITOR:

Your postal of the 21st inst. was received. The amount of \$5,369.49 charged to Year Book No. 4 should have been for Year Book No. 3 and Year Book No. 4.

The amounts are as follows:

| | |
|------------------------|------------|
| Year Book, Vol. 3..... | \$2,456.98 |
| Year Book, Vol. 4..... | 2,912.51 |
| Total..... | \$5,369.49 |

(Signed)

H. M. WHELPLEY,

Treasurer of A. Ph. A.

W. B. DAY, *General Secretary.*

DRAFT BOARDS DETERMINE CLASSIFICATION.

THE EDITOR:

As you may know, the question of the increasing depletion of the ranks of pharmacists by the draft and the consequent diminution of pharmaceutical service to the civilian public has a number of times been brought to the attention of officials at Washington with the suggestion that drafted pharmacists be put into Class V. Provost Marshal General E. H. Crowder

has made statements relating to the matter to the effect that under the Selective Service Regulations there is no authority to grant deferred classification, except by the application of the rules for classification by the local and district boards. General Crowder further stated that the district boards have exclusive original jurisdiction to hear and determine all questions on claims for deferred classification by or in respect of persons engaged in industries found to be necessary to the maintenance of the military establishment or the effective operation of the military forces or the maintenance of the national interests during the emergency. The General does not attempt to define a necessary enterprise. He states that what might be a necessary enterprise for one locality might not be for another, and confusion and error would likely arise if a general attempt were made to prescribe what are and what are not necessary enterprises within the meaning of the Selective Service Regulations.

You will note, therefore, that the local and the district draft boards have the power to determine in individual cases whether or not a drafted pharmacist should be placed in a deferred classification. It occurs to me in this connection to suggest that this information should be given the widest publicity among pharmacists and I think it would be entirely proper for you to publish a statement covering this matter in the next issue of the JOURNAL. It cannot be considered unpatriotic to urge this matter upon the attention of pharmacists because there are many cases in which entire communities have been deprived of pharmaceutical service. The Government surely does not want this to be so, especially in view of the fact that the many pharmacists who are in actual service, are not recognized as anything else than privates or at most master sergeants.

(Signed)

FREDERICK J. WULLING.

THE PHARMACIST IN THE ARMY MEDICAL DEPARTMENT.*

TO THE EDITOR (JOURNAL A. M. A.):

There seems to be a well-defined attitude toward pharmacists in the Army—that of almost completely ignoring their professional distinction, along with an amazing indifference as to their proper place and utilization. Needless to say, such a policy results not only lamentably as regards the pharmacist's status in the Army, but his professional value is lost to the Medical Department.

It is also quite apparent that since modern war machines are essentially and thoroughly businesslike in structure and character, modern methods must be employed to achieve success. It is therefore logical and imperative that every branch and wing of that complex machine be conducted on the modern principle of specialization. The trained man, the specialist, was never more desirable, never before absolutely indispensable. Such a principle is the very backbone of all modern institutions, and invariably spells success. Division of labor and centralized effort are built, supported and owe their existence to the specialist—the trained man.

The pharmacist is a specialist, trained in a part of medical science that cannot be ignored without affecting the efficiency of the Medical Department as a whole. A pharmacist's business ability to buy and distribute should be taken advantage of in medical supply depots. His experience would help to correct mistakes in buying and avoid improper packing for distribution of such supplies. This part cannot be emphasized too strongly, since it would effect an enormous economy hardly ever appreciated by non-professionals. Likewise, a pharmacist would be invaluable at large base hospitals, and his recognition becomes imperative when the dangers of the improper compounding of prescriptions by non-trained men are fully realized.

Aside from sentimental considerations for the pharmacist as an underpaid, neglected professional, his recognition is dictated by common sense and cannot fail to justify itself from a business and economical standpoint. Never would such a step be more timely, never was it more obvious and desirable. Indicating criticism of the present system of the neglected pharmaceutical branch of the Medical Department could be easily brought to light. The method of packing for distribution could be pointed at as wasteful, which a professional eye could readily detect and condemn. Immense savings could be gained even in the small Army dispensaries were the business end of medical supplies placed in the hands of the logical man—the pharmacist. As for prescriptions, their importance and the skill required for their preparation cannot be overlooked.

* Reprinted from the Correspondence Columns, *Journal A. M. A.*, May 25, 1918, p. 1562.

The idea that a bright private could be taught to perform the few simple operations is not only fallacious but also fraught with dangers.

Perhaps the following incident will serve to illustrate the folly of just such a belief: At an examination for promotion to the grade of sergeant, the aspirant was asked what a "C. C. pill" is. "Any pill containing one cubic centimeter," was his immediate reply. Another applicant was asked how to administer a Seidlitz powder. "Place the powder on the patient's tongue and wash it down with water," was his answer.

Pharmacy is a science—as exacting and important as the science of surgery—and a pharmacist's place should be second only to that of the surgeon. Are civilians more entitled to protection against mistakes of unskilled hands than soldiers?

ALBERT WHITE,
Post Dispensary, Corozal, C. Z.

MILITARY INSTRUCTION FOR COLLEGE STUDENTS.

To the Presidents of all Institutions of Collegiate Grade:

In order to provide military instruction for the college students of the country during the present emergency, a comprehensive plan will be put in effect by the War Department, beginning with the next college year, in September 1918. The details remain to be worked out, but in general the plan will be as follows:

Military instruction under officers and non-commissioned officers of the Army will be provided in every institution of college grade, which enrolls for the instruction of 100 or more able-bodied students over the age of eighteen. The necessary military equipment will, so far as possible, be provided by the Government. There will be created a military training unit in each institution. Enlistment will be purely voluntary, but all students over the age of eighteen will be encouraged to enlist. The enlistment will constitute the student members of the Army of the United States, liable to active duty at the call of the President. It will, however, be the policy of the Government not to call the members of the training units to active duty until they have reached the age of twenty-one, unless urgent military necessity compels an earlier call. Students under eighteen and, therefore, not legally eligible for enlistment, will be encouraged to enroll in the training units. Provision will be made for co-ordinating the Reserve Officers' Training Corps system, which exists in about one-third of the collegiate institutions, with this broader plan.

This new policy aims to accomplish a twofold object: first, to develop as a great military asset the large body of young men in the colleges; and second, to prevent unnecessary and wasteful depletion of the colleges through indiscriminate volunteering, by offering to the students a definite and immediate military status.

Later announcement will be made of the details of the new system. In the meantime, presidents of collegiate institutions are requested to call this matter to the attention of all their students. Those who do not graduate this Spring should be urged to continue their education and take advantage of this opportunity to serve the Nation.

I trust that the policy above stated will have your support and cooperation.

(Signed)

NEWTON D. BAKER,

Dated May 8, 1918

Secretary of War.

POSTPONEMENT OF EXAMINATION FOR FAIRCHILD SCHOLARSHIP SCHEDULED FOR JUNE 25, 1918.

In order to establish a plan of award for the Fairchild Scholarship in line with recommendations which should receive further consideration by the Committee, I hereby give notice of postponement of such examination scheduled for June 25, 1918. Decision will be withheld until the A. Ph. A. Convention, at which time a meeting of said Committee will be held. At latest, announcement will be made September 1, and Scholarship awarded by October 1, 1918.

Other members of the Committee are:

R. A. LYMAN, Lincoln, Neb.

J. W. STURMER, Philadelphia, Pa.

GEO. C. DIEKMAN, New York.

H. C. CHRISTENSEN, *Chairman,*

Committee on Examination for Fairchild Scholarship,

4149 Vincennes St., Chicago, Ill.

(See also page 577.)

COMMITTEE REPORTS

REPORT OF COMMITTEE ON PATENTS AND TRADE MARKS.*

In accordance with the request of the Association, your committee has revised the United States copyright, patent and trade mark laws in so far as they specially apply to pharmacy and pharmaceutical chemistry, and herewith presents the proposed revision for your consideration and discussion.

The reason why you have asked your committee to make this proposed revision is for the purpose of eliminating certain objectionable features pertaining to these laws, relating either to the laws themselves or to their interpretation and application by the courts. The objectionable features referred to are as follows:

1. The copyright and patent laws, as they now exist or are interpreted or applied, fail in securing their object as defined in the Constitution of the United States, Article I, Section 8, Clause 8, which clearly states that the object of the copyright and patent laws is to promote progress in science and useful arts by granting to authors and inventors for limited times exclusive right to their respective writings and discoveries. It is contended that these laws, as they now exist, or are interpreted or applied, are a hindrance to progress in the arts of pharmacy and pharmaceutical chemistry for reasons hereinafter to be stated.

2. The trade mark law is not founded upon the clause of the Constitution serving as the foundation for the copyright and patent laws. As stated by the Report of the Commissioners Appointed to Revise the Statutes Relating to Patents, Trade and Other Marks, and Trade and Commercial Names under Act of Congress approved June 4, 1898, and published as Senate Document No. 20, 56th Congress, second session, printed by the Government printing office, Washington 1900, page 97. "It was supposed that the power of Congress to provide for the registration and protection of trademarks was derived from the clause of Section 8 of Article I of the Constitution, which provides for the promotion of 'the progress of Science and Useful Arts by securing for limited Times to Authors and Inventors the exclusive Right to their Respective Writings and Discoveries.' Nowhere in the discussion is found any reference to the clause of Section 8, which gives Congress the power 'to regulate Commerce with foreign Nations and among the several States and with the Indian Tribes.' So far as appears from the discussion of the bill, trademarks were regarded as analogous to patents and copyrights and their relation and importance to commerce appear to have been little understood."

Referring to the discussion of the Supreme Court in the trade mark cases, the same authority, page 100, says: "Criminal prosecutions being had under the statutes of 1870 and 1876 in the southern district of New York and the southern district of Ohio, and a difference of opinion having been certified to the Supreme Court on the question whether these acts of Congress on the subject of trade marks were founded on any rightful authority in the Constitution of the United States, the cases came before the court for review at the October term of 1879. (Trademark Cases, 100 U. S., 82.) The court showed with admirable clearness that because of the distinction between patents and copyrights and trademarks, pointed out in the decision, the power of Congress to enact the law could not be derived from that paragraph of Article I, Section 8, of the Constitution which relates to authors and inventors, since the right of ownership in trademarks is created by adoption and not by authorship or invention."

"A trademark," according to the same authority, "may consist of a name, symbol, figure, letter, form or device." "It is generally considered that a mark to be effective for its purpose should be as simple and striking as possible, should either consist of or have as a prominent feature some representation or word which will be readily caught by the eye of the purchaser and retained in his memory, so that when he comes to make a second purchase he will look for and readily recognize that particular mark. Such trade mark is, for instance, the representation of a star, an anchor, crescent, crown, cross, diamond, seal, triangle, or the word 'star,' 'arrow,' etc."

* Presented during the first session of the Section on Education and Legislation, Indianapolis meeting, August 29, 1917, by Chairman F. E. Stewart. After discussion, the report was referred to the General Session of the Association

"The representation of a star or the word 'star' has been registered in the United States Patent Office as a trademark for nearly every recognized class of goods, having been registered nearly 400 times, indicating that, leaving out of consideration registrations to the same owner, made necessary by a change in the law, several hundred manufacturers and dealers have adopted and used that mark on some class of goods. In about 150 instances, the representation of an anchor or the word "anchor" has been registered.

"It will of course be understood that a star or an anchor or any other mark may be used by manufacturers of or dealers in different classes of goods without conflict. For instance, the use of a star as a mark for tobacco does not conflict with the use of a star as a mark for matches or dress braid. It is only when two persons put upon the market goods of the same class bearing the same mark that confusion in the mind of the public is liable to be caused or purchasers are deceived."

It is perfectly apparent from these quotations that in dealing with the subject of trade marks we have under consideration something entirely different than that of copyright and patent. It is objected that the trade mark is being deliberately diverted from its lawful purpose and that the trade mark law is being stretched to cover the same ground as the patent law with the idea of substituting the trade mark system of registration for the patent system, for the purpose of obtaining privileges not to be secured under the patent law and protecting and fostering unfair competition. It is therefore urged that the trade mark law shall be so revised as to prevent this abuse.

3. Another objectionable feature which pertains more particularly to the patent law is, that foreign countries are permitted to patent their inventions in the United States without being obliged to manufacture them in this country. Consequently, the United States patent laws are being used by foreign nations to build up commerce in their own countries to the injury of the United States. This objection might be obviated under treaties whereby foreign nations would grant to the United States the privilege of permitting American inventors to patent their inventions in foreign countries and manufacture them in this country—in other words, foreign nations should grant us the same privileges we grant them.

4. Quoting again from Senate Document No. 20, "Under the United States patent law no class of inventions is excluded from protection. The same is true of Great Britain and the British colonies generally. But many foreign countries exclude from protection one or more classes of inventions. The class of inventions which more than any other is excluded from patent protection is that relating to medicines. It is excluded in Germany, France, Austria-Hungary, Italy, Japan, Denmark, Norway, Sweden, Portugal, Russia and a number of other countries. Other classes of inventions excluded from protection in many countries are foods, chemical products and inventions relating to war material."

"Exclusion from protection of inventions relating to medicines or foods does not generally extend to those relating to processes or apparatus for their manufacture. In all foreign countries which exclude chemical products from protection, except Switzerland, inventions relating to chemical processes may be patented and in nearly all such countries it is expressly provided by law that a patent for a chemical process by which a new chemical product is made shall in fact cover such product unless it is shown that such product was in fact made by some other process.

"It has been urged before us, both at the hearings above referred to and in written communications laid before us that the United States law should be amended to exclude from patent protection both medicines and chemical products generally, at least so far as such inventions are the inventions of subjects or citizens of the foreign countries which exclude these classes of inventions from patent protection, and it has been contended that subjects or citizens of foreign countries should not be permitted to receive in this country patents for inventions which are not patentable in their countries."

5. It is claimed by the objectors that it is to the benefit of the entire community that the practice of pharmaceutical and pharmaco-chemical arts should be conducted in harmony with the scientific and professional requirements pertaining to the educational system of the country, so that coöperation may be secured between educational and commercial interests in promoting progress in science and in the useful arts; and that no system which permits individuals, firms or corporations, to exercise ownership or control over the names or articles of commerce can receive the sanction of the educational institutions of the country. The exercise of such ownership is a

menace to the entire educational system of the country which is apparent when the following facts are considered:

Every article of commerce must have a name of its own whereby it may be manufactured and dealt in, and that if such name is subjected to individual ownership then the educational machinery of the country becomes a great advertising bureau for the exploitation of commercially controlled products. Furthermore, as the information concerning these products appearing in advertisements is necessarily biased, the educational machinery of the country also becomes the means of teaching error, and, in the case of medicines, exploiting the sick room for gain.

6. It is further objected that the conditions now existing not only prevent coöperation between the educational and industrial institutions of the country, but also inculcate ill feeling, hypocrisy and deceit in the relations existing between the professional men and the manufacturers and merchants; between the scientists on the one hand and those who are utilizing the discoveries made by scientists for promoting the industries of the country. This is well illustrated by a statement made by Dr. W. W. Keen of Philadelphia, in a letter on the subject of so-called "ambrine," published in the *Philadelphia Ledger*, February 25, 1917.

Dr. Keen says, in the letter referred to: "In spite of a high opinion of this new and evidently successful treatment, I have a very serious criticism to make. Medicine is a profession not a trade. New methods of treatment, new drugs, new instruments, devised, discovered or invented by instrument makers or any other persons other than doctors, may be freely patented in order to reimburse and reward the inventor. But such methods, instruments, drugs, etc., devised, discovered or invented by doctors, our profession holds should be freely given to the world. A patient burned in Tokyo, Cape Town, Buenos Ayres, or Philadelphia should have all the advantages of such a beneficent discovery instantly and not have to send to Paris for it or go without. Such professional knowledge we hold should be at the service of humanity everywhere. The doctor gains his pecuniary reward from a larger reputation and a wider clientele. Besides this, his personal joy in so benefiting humanity is an incalculable reward."

It is claimed by the objectors that the position taken by Dr. Keen in this matter is the position taken by the medical profession throughout the world, and yet the medical journals are obtaining an enormous income from advertising these same commercially controlled products and if they are successful are obtaining an income and reputation by so doing, and therefore the position of the medical profession on the subject is very inconsistent to say the least.

It is not the province of your committee to condemn the medical profession for their ethics because the position of the profession on the subject is undoubtedly sound. Neither is it our province to condemn the profession for the ethical lapse referred to. However, as pharmacy is a part of medicine, and physicians and pharmacists are necessarily mutually dependent in relation to the preparation of medicines and their proper use in the treatment of the sick, pharmacists have a right to expect that the medical profession will not disregard its fraternal relations.

It is not our province to condemn the manufacturers of medicinal products who avail themselves of the privileges of our patent law or take advantage of the misunderstanding relating to the trademark law, but it is the province of your committee to point out these conditions so that you may, as an Association, be placed in position to consider intelligently the proposed revision of the copyright, patent and trade mark laws we are placing before you for discussion.

Your committee has published in the *JOURNAL* of the Association, the proposed revision of these laws, and preambles and resolutions containing evidence in support of our suggestions in relation to the proposed revision. We are now placing in your hands reprints of the same that you may have the matter before you in the proper shape for consideration.

Your committee in making its suggestions as to the revision of the copyright, patent and trade mark laws has added to the laws as they now read, certain sentences, paragraphs and sections intended to overcome the objections above enumerated.

1. We have added to all three of these laws a paragraph in conformity with circular No. 19, issued by the Librarian of Congress stating that no copyright shall subsist in coined names, names of articles of manufacture, names of games or puzzles, names of substances, names or products or names of medicines.

2. We have made it necessary for the applicant desiring a patent relating to a chemical substance, medicine or food, to provide such product with a distinct name which will afterwards be

used by him, his executors, administrators and assigns as the principal title thereof on all labels, in all advertisements and in all literature relating to the product. We have also added a similar requirement to the trade mark law to prevent the registration of a trade mark for new articles of manufacture, chemical substances, medicines or foods, unless a distinctive name shall accompany the application in each instance, for use of those who would compete in manufacturing and vending the same article and also for the use of the public in purchasing same.

3. We have provided that the manufacturer of a patented product shall continue to produce the product by the patented process during the life of the patent and by no other process unless he shall apply for patent for same, and in case patent is granted for a new process he shall announce the fact in at least three prominent medical and pharmaceutical journals, respectively, calling attention to the new process and giving the number and date of patent thereof. The reason for this is obvious and will be apparent to anyone who has had any dealings with the methods sometimes employed by manufacturers of patented products.

4. We have proposed a section as an addition to the patent law containing a similar proviso to that contained in the copyright law relating to alien inventors, which we believe will exclude from patent protection inventions of subjects or citizens of foreign countries which do not grant similar patent privileges to the citizens of the United States. We have been informed that the section taken from the copyright law, which we have modified for the purpose, was written by the late president, Taft, whose knowledge of international law gives him a position of acknowledged authority.

5. We have suggested appropriate sections to cover the objection relating to the limitation of patent privileges, using for that purpose sections from the German patent law. The special paragraphs to which we wish to call your attention read as follows: * * * *

"No patent shall subsist for, inventions relating to articles of food, or medicines, as also substances prepared by chemical processes in so far as the inventions do not relate to a definite process or apparatus."

"If the invention relates to a process for the production of a new substance, all substances of the same chemical composition are considered as having been made by the patented process until proof to the contrary is given to the Commissioner of Patents."

6. As stated in our brief, your committee favors an amendment to the patent law requiring the Commissioner of Patents to submit all applications for patents relating to medicine and dietetics to the Committee of Revision of the United States Pharmacopoeia for approval before granting the same.

Professor Remington objects to this suggestion thinking it will throw too much work on the Committee for revising the Pharmacopoeia. However, your committee does not insist on this but believes that applications for patents relating to medicines and chemical substances should be referred to some kind of a committee or commission representing the medical, pharmaceutical and chemical professions, before such patents are granted. When you consider that a patent was recently granted for flavoring solution of epsom salts with peppermint and other essential oils, it is very apparent that there is, at present at least, no one connected with the United States Patent Office sufficiently qualified to decide what is meant by a "*new and useful invention*" in the meaning of the patent law, in so far as medicine, pharmacy and chemistry are concerned.

DISCUSSION.¹

J. M. FRANCIS: What bearing has the proposed resolution upon the matter of process patents? What policy does the committee advocate?

F. E. STEWART: The solution of the problem in regard to product patents is contained in a provision of the German patent law which you will find in the proposed revision of the United States patent law suggested by your Committee and published as part of your committee's report in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, April 1917, under the head "Preambles and Resolutions Relating to Revision of the U. S. Copyright and Patent Laws." I hold a reprint of this portion of the report in my hand.

¹ Discussions are reported in full instead of in abstract, as both sides of the question are thereby more clearly brought to the attention of the readers and for their consideration.

The provision to which I refer is as follows: "No patent shall subsist for * * * * * inventions relating to articles of food or medicines as also substances prepared by chemical processes in so far as the inventions do not relate to a definite process or apparatus for the preparation thereof." "If the invention relates to a process for the production of a new substance, all substances of the same chemical composition are considered as having been made by the patented process until proof to the contrary is given." The object of this proviso is to promote research for the purpose of stimulating inventors to investigate patented processes for the purpose of improving them during the life of the original inventors' patent, so that when an improved process is discovered whereby the same product may be produced at less cost or of better quality, the public may have the benefit of it without awaiting the expiration of the original patent, which, according to our patent law, continues for seventeen years. The proviso is also intended to protect the original inventor from unfair competition. No person can enter the field without proving that his alleged improvement of the inventor's patented process is sufficiently valuable to warrant the Government granting him the right to compete with the original inventor. The burden of proof is upon him.

It is urged by those who oppose any change in our patent law in relation to product patents, that such a proviso as that contained in the German patent law is not workable in the United States because of a difference in our method of jurisprudence. Under our system of jurisprudence a person must be considered innocent until he is proved guilty, therefore, say the objectors, unless the product itself is so covered by patent that no person is permitted to enter the field in competition, no matter how great his improvement of the original process, an injustice would be done to the original patentee for the reason that the burden of proof would be thrown upon the defendant. There would be no way for the Government officials to find out whether the person claiming to have made an improvement had made such in fact, because his laboratories would not be open to the inspection of Government officials. He would therefore be in position to appropriate the original patented process and employ it in producing the same products, as there would be no way of proving infringement because the inventor of the alleged improvement could claim that his process was his trade secret and that no one had any right to enter his laboratory and prove to the contrary.

I took this matter up with one of the commissioners of the Patent Office and he laughed at the objection as absurd. He agreed with the suggestion made to the chairman of your committee, by the head of one of the large German chemical houses. This gentleman suggested that the United States patent law should be so revised as to make it incumbent upon the alleged inventor of an alleged new process to apply for a patent upon same before being allowed to use it commercially. This would place the Commissioner of Patents in position to pronounce upon the validity of the claim made by the alleged inventor of a new process for producing a patented product.

It has also been suggested that our patent law should be not only changed in such a manner as to conform with the proviso of the German patent law, but also that a provision should be added requiring that the inventor of an improved process for manufacturing a product already patented, should be forced to pay a royalty to the original inventor during the life of the original patent. It was pointed out that the original inventor blazed the way for others to follow and that it is no more than fair to reward him for his pioneer work in this manner.

Your committee in a footnote which you will find at the bottom of page 405, *JOUR. A. PH. A.*, April 1917, stated: "The Committee believes that all ambiguity now existing in the law should be removed in the revision. Provision should also be made in the law so that the inventor of a new process can secure a royalty from the original patentee."

One of the reasons why your committee suggested that the proviso of the German patent law referred to should be introduced into the patent law of the United States is as follows: The object of the patent law is to promote progress in science and useful arts—in this instance in the science of medicine and in the useful arts of pharmaceutical chemistry and therapeutics. This it seeks to do by granting to inventors, for limited times, the right to prevent others copying their inventions, in exchange for the publication of full knowledge thereof whereby others may use the inventions freely for commercial purposes when the patents expire.

Cooperation between the educational and commercial institutions of the country is essential to promoting progress in science and the arts. Cooperation can never be secured between the

educational institutions teaching medicine and the commercial interests supplying materia medica products under a system of monopoly of the kind protected in this country by the patent law. The German government realized the necessity of leaving materia medica and food products open to competition so as to secure the necessary coöperation between the medical profession and its institutions of learning and the producers of materia medica products. It therefore limited the patents to processes only, leaving the products themselves open to competition in the manner already described.

The German patent law separates inventions relating to medicines and foods from other inventions because of humanitarian reasons which we in this country do not seem to recognize properly in this connection. It is because we do not recognize this humanitarian ideal of professional practice that we pharmacists and chemists are criticized by the medical profession, philanthropists and political economists. We are accused of exploiting the sick room for gain and spending our time in the endeavor to see how much money we can make out of a sick man.

In the American Therapeutic Society we have a by-law that no paper may be read or discussed concerning a commercially controlled materia medica product except to condemn it. This by-law was passed to protect the Society and thus protect the public from commercial exploitation by the representatives of commercial interests, who may come to its meetings for the purpose of reading papers advocating the use of monopolized materia medica products. If we expect to obtain the coöperation of educational interests of the country in promoting progress in the science of materia medica and in the useful arts of producing materia medica products and applying them to the treatment of the sick, it is absolutely necessary that we give proper attention to necessary professional and scientific requirements.

J. M. FRANCIS: There is no doubt that this committee has devoted a great deal of attention to this subject, and I want as an individual to do them all honor in saying, I think they are absolutely conscientious in these recommendations. However, this is a country in which everyone is allowed to indulge in his own opinions, and give his reasons therefor. There are some things in the recommendation of this committee I approve of most heartily. There are some that reflect a great deal of human nature. It is very natural that an American should demand for his own people the same privileges abroad, that the subjects of a foreign country receive from our government institutions. It is very natural to say that if a French patent is issued in the United States that we should force the French patentee to manufacture that product in the United States, because the French government would adopt the same procedure in the case of an American who obtained a patent in France. It is not upon this portion of the recommendation, however, that I wanted to speak to you, but I do want you to consider some phases of this matter very carefully, because I believe that the members of the American Pharmaceutical Association are eminently fair, and I do not think that we want to take any hasty action—we do not want to be stampeded. I should very much regret to see the influence of this great national association thrown to the advocacy of a course of procedure which I think would be very unjust. Now, please remember that the policy adopted by this committee, if allowed to pursue its normal course, looks to the support of this Association, which will finally and in the form of a recommendation to Congress, revise the present patent laws.

There is one feature I want to discuss particularly, and that refers to the granting of PRODUCT PATENTS. I am not going to touch on the copyright phase of the matter, because that is a matter of less importance. According to the Constitution, or the sections that were quoted, the ideas embodied therein were very broad and patriotic, that a man should enjoy the results of his own ingenuity or labor, that he should receive proper returns, and a certain length of time was assigned—I think seventeen years—during which inventors should receive this reward. Perhaps that is too long, and it might be wise to reduce that time, but I certainly protest that it will work a very great hardship if a man is denied the fruits of a product patent. Now, let us look at it in a common sense way. If I, as the result of months or years of study or chemical experimentation, succeed in producing something of a very great value in medicine or the arts—not being granted a *product patent*, I am granted a patent only on a specific *process*. It is a matter of common knowledge that in ninety-nine cases out of a hundred, the process that is worked out in accordance with the knowledge of chemistry existing at that time, will be a very crude and a very expensive one. I defy any man before me to cite a single chemical or pharmaceutical or medicinal substance manufactured by chemical reactions, the process of which was not improved very materially

within one or two or perhaps at the outside three years from the time it was originally patented, and its manufacture commenced. It is the most natural thing in the world that chemical processes should be improved, and that with the bringing to bear the minds of various chemists that improved processes should be worked out—processes differing very materially perhaps from the original process employed. Now, what would be the natural result? The man who spends his money, his brains and time, in working out a problem of this kind will soon be deprived of the result of his labor, because the attention of some other individual has been attracted to the value of this particular substance. The idea may have lain fallow for a hundred years, and the second or third man never thought of it; he never saw any inducement to spend any time or money on it; but when the original inventor has brought it forth and proved its value as a dyestuff or a medicine, then this second pirate—and you cannot call him anything better than a scientific pirate—sees the benefit, sets up in competition by using some other process, and is able to take advantage of this and reap the fruit of the inventor's intelligence and industry. Now, if this committee recommendation is adopted, the original inventor is absolutely helpless. A chemical discovery is not on the same basis as a mechanical invention. If I invent a machine for knitting socks, I have a product that will show its originality; I manufacture them of a certain shape and involving certain mechanical processes and parts. I place my machine on the market. If another man places a knitting machine on the market which embodies the principle involved in my machine it is evident at a glance, and it does not require any proof; it only needs that a skilled man look at it and the infringement is apparent and the inventor has his recourse.

Suppose I should produce "phenacetin" and it had not been discovered before. We now know it is of immense value. I introduce it for the first time, but I have nothing except a process patent. I begin to manufacture it; Smith knowing its value, erects a plant, throws a sixteen-foot brick wall around it, and begins to manufacture it. How am I going to prove that he is not infringing my process. The Committee says, "Bring Mr. Smith into court and force him to prove that he makes 'phenacetin' by a different process." That is the law, as I understand, in Germany and that is the procedure the committee recommends in the United States.

Gentlemen, the people in the United States do not think like the people in Germany. Their whole code of legal procedure is different; their method of thought is different, and a thing of that sort does not appeal to American people. In this country we look upon a man as being innocent until he is proved guilty. By this process we are going to upset our institutions and adopt the un-American idea of assuming a man is guilty until he proves his innocence. But, wholly aside from that, you are throwing around the original inventor, difficulties that it is almost impossible to overcome in fighting this underhand competition of a second man who wants to infringe his process. It is unethical; it is un-American; it is essentially wrong.

There is another phase of this matter—You cannot take capital by the scruff and force it to invest in manufacturing projects. All great achievements along chemical lines are brought about by the expenditure of money. You cannot buy brains without money, and, brains are commanding more money every day. You have to get a man with brains and training and you have to give him the proper apparatus and equipment and environment, and all that calls for the expenditure of money. If you individually have five thousand dollars or fifty million dollars to invest, where are you going to put it? Are you going to place it in backing research of this kind, looking for new technical, chemical or pharmaceutical products, where you have no more protection than is offered by this committee's recommendation, or are you, going to put your money in harvesting machines or soap or sardines or hay and the thousand and one other things that will give you a more assured income? This is not a matter of theory. It is a hard, cold fact. Money is going to the enterprise where it has the best protection and yields the largest income. Such things are not done as a matter of sentiment, I am sorry to say. Money is behind them and money is the driving force all through. It requires money, money, money all the time to carry out work of this kind.

Now, just one more thought. This great war in Europe has taught us one thing, if nothing else, and that is the fact that we are absolutely, hopelessly, shamelessly dependent on Europe for pharmaceutical, medicinal and chemical products of all kinds. Where do you get all those things—even common chemicals? From Europe. You cannot today place in the United States an order for immediate delivery for as much as two tons of ordinary precipitated sulphur. Isn't it ridiculous? I know of but one firm in the United States who are making precipitated sulphur.

Cinnamic acid used to sell for two dollars per pound, imported from abroad, and yesterday I saw a quotation demanding a contract for a 1000 pounds at \$25.75 a pound, and there is only one firm today making cinnamic acid; up to two years ago there was not a pound manufactured in the United States. You could not buy a pound of diethyl aniline in the United States two months ago, and there is only one firm today making it.

We must pay a protective price to a reasonable extent to build up our chemical industries. The United States has made itself the wonder of the world because its metal industries have received proper protection in the form of a protective tariff. Back in the eighties a few manufacturers in the United States began the fairly successful production of aniline dyes. They had the proper protection at that time, and many thousand dollars were spent in promoting this industry. A change in administration and the selfishness of the men who used the dyes wiped out this protection and the color industry in the United States practically died. Now we wish we had it, and have not. We might have had a color industry today that would have made us independent of the world if this protection had not been removed. You remember a few years ago when the farmers demanded the protection of beet sugar. They claimed that it would employ labor and result in cheaper sugar. They claimed it would be to the interest of the whole United States to do so. A lot of us did not think so, and it looked as if the beet sugar industry was about to be wiped out not so long ago. Now, what is the result? The protected beet sugar industry stands to save the United States millions of dollars. I mention this to show that by paying a little more for a few years, it comes back like bread upon the waters, back to the American consumers to the extent of millions of dollars. The same thing applies to the protection of chemical and pharmaceutical substances based on chemical processes.

I think I have said enough to show that this proposal calls for most careful consideration. There are two sides to it and I do not believe it would be a wise move for this association to advocate the abrogation of product patents.

ALEX. M. ROVIN: This subject, I understand, invokes two schools of thought—the materialistic and the ideal school. It is true, in the light of history, we know that the incentive which modern materialistic thought has recognized is money, money, money; but on the other hand in the light of history, impartially speaking, we do know that in the development of every field of science, if has not been from an incentive of money. Anyone that knows anything about general history as applied to the sciences and arts, knows that whenever there has been a science developed in its slow but sure process, it has been principally through the natural desire of man to contribute something to general society. In this day we live in an age of extreme materialism and the law of competition is very intensive and very acute, and this particular tendency has compelled society, especially of the United States, to make an effort to protect the ingenuity of man. That is all true. To our material advantage, the financial advantage, the recommendations of Doctor Stewart are contrary, but in the light of real human instinct we must not forget that every stage of society is displaced by a new stage, and let us look forward to this fact, that commercialism as we understand it today, as we practice it today, is merely a passing stage of the game in human society, and the idealistic school will eventually predominate. The incentive to the progress of science is not money only. This is the answer I would like to make to the statement of Doctor Francis. I am convinced that protective laws are essential, but there are better ways and methods to employ in order to go ahead in the field of scientific endeavor. I endorse the moral and ideal spirit of Doctor Stewart and from a material standpoint I accept the reasoning of Doctor Francis.

FRANK R. ELDRED: Doctor Francis has stated in a very forceful way his individual views of the subject. I want to add a few words which represent my personal views, and at the same time point out the attitude of the American Chemical Society which I represent as delegate to this Association.

In order to show you the different conclusions in regard to two points covered by the report of this committee, that is to say, the subject of product patents and of a compulsory working clause, I want to tell you about the work of the committee on patents of the American Chemical Society. This committee, consisting of Dr. Leo. H. Baekeland, Dr. B. C. Hesse and Dr. William Grosvenor, has gone into the matter very thoroughly. They have not only brought in recommendations and made statements concerning these points, but Doctor Hesse has backed them up with a very extensive compilation of statistics.

We must consider two stages of the problem, the theoretical and the practical. Theory,

as we all know, is a very good thing, as a starting point, but you are aware that if a number of chemists get together to discuss any point of chemical theory, some very striking differences of opinion will immediately arise, and then they must secure experimental evidence to prove their theories. After all, the theory is only good in so far as it enables you to test it and thus establish the facts. Now, that is exactly what has been done, in the compilation of these statistics to which you can all refer in the *Journal of Industrial and Engineering Chemistry* for April and November 1915. You will find I think thirty or forty pages of statistics and discussion. If you will take the time to go over that mass of statistics carefully I think you will have a very clear view of this whole question. Compulsory working, in theory, is a beautiful idea, but these statistics will prove to you that where this theory has been put into practice, it has been a failure. If I had time, I might offer an explanation of the failure of such legislation, but it has been proved that compulsory working has wrought injury to the industries of the countries where it has been tried, rather than good as you might theoretically expect it to do. That was a case of testing a theory and proving it to be fallacious.

Now in regard to the product patent for chemicals, the argument is often advanced, and it is perhaps the chief argument, that the great chemical industry of Germany was built up under the protection of process patents only and therefore that system would be a good one for us to adopt. However, if you will look into the German process patent and the manner of granting patents on chemical processes in Germany, you will find that the product itself is more completely protected in Germany than it is by our American product patent. That may have something to do with the fact that the chemical industry was built up to such a wonderful extent along certain lines in Germany—the fact that they had even greater patent protection than we had in this country.

Another argument which is advanced is that the product patent works a hardship on the American manufacturer. This is really a ridiculous statement. As Doctor Francis pointed out, the only way in which the American manufacturer is willing or able to develop the chemical manufacturing industry in this country is under complete patent protection. The fact is largely overlooked that when you try to cover drugs and medicinal chemicals, you cannot stop at medicinal chemicals, and some of the people who favor the abolition of the product patent fail to point out that when you hit the medicinal chemicals, you also hit a very large number of technical chemicals. In fact, it would affect all organic chemicals, and their manufacture would never be developed to any great extent without proper patent protection.

The justice of granting to the inventor of a chemical product the same protection you would grant to the inventor of a mechanical or electrical contrivance is so apparent it hardly needs to be mentioned. The American Chemical Society, with ten thousand members, including both university and industrial men, has favored and is advocating very strongly the continuance of the product patent, and also opposes compulsory working. This will show you what the chemists of the country who have made a very thorough study of chemical patents think of the subjects under discussion.

I do not understand Doctor Stewart's idea in regard to the cooperation between the practical and the educational pharmaceutical men. In the American Chemical Society the cooperation between the educational men and industrial men is very close and the educational men are just as much united in favoring thorough patent protection as the industrial men. It seems to me that this Association should be very careful, to take no action in opposition to the position of another association which has studied the subject of chemical patents as carefully as the American Chemical Society has done.

As you know, the manufacture of dyes is now being taken up extensively in this country and the manufacturers are very much opposed to such changes in our patent laws. They feel that it will jeopardize the dye industry in this country if they do not receive the protection of product patents. In discussing this matter we also frequently overlook the fact that previous to the European war the value of the products of a chemical nature which we exported to Germany was greater than the value of the chemical products which we imported from Germany. Moreover the value of the German patents held by citizens of this country is greater than the value of the United States patents held by citizens of Germany and therefore in discussing chemical patents we must take into consideration the effect of any proposed legislation upon the patent system as a whole.

EDITORIAL NOTES

Editor: E. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

THE COLLEGES OF PHARMACY AND THEIR STUDENTS.

Commencement exercises of the colleges of pharmacy have been held and it is safe to say that the graduating classes of most schools have been smaller than heretofore. The reason for this is known and therefore every effort should be made by the schools to stimulate attendance in every permissible way. We have heretofore stated that in times like the present suggestions are acceptable that would not be advised under normal conditions.

It seems to us that the years of preliminary drug store experience as entrance requirement to schools of pharmacy might be cut down so as to assure graduation before the candidates have arrived at their majority. Boards of Pharmacy could examine candidates even though they are less than 21 years of age and deficient in years of drug store experience. Report on their examination could be withheld or a temporary certificate given them. With some schools and in some States this might not be possible, but it is a matter that should be carefully considered under present conditions, always bearing in mind that there will be an end to this war. The schools must have students, not only for revenue but so the public may be efficiently served; the proposition therefore involves both an economic question and a duty.

For the reason that pharmacists are not exempted by virtue of their profession, though district boards, when they deem necessary, may place them in deferred classes, every pharmacist within the age limits may be drafted and thus leave some communities without any pharmacists; in fact, there are such instances now. (See letter of Ex-President Frederick J. Willing in Correspondence Columns.)

It is unnecessary to suggest that every related act of pharmacy schools should be based on assisting the Government in its mobilization; this they have done from the very beginning of the war, are doing now and will

continue to do, but there is a necessity for conserving pharmacists and students for pharmacy schools. Women should be encouraged to take up the study of pharmacy but, unless they have already engaged in the work, relief from this source could not possibly come for a number of years.

An editorial "Colleges and the Country," in the *Philadelphia Public Ledger* of May 21, 1918, refers to the burdens of educational institutions and the importance of coordination of the colleges with Government departments as a war necessity. Part of the editorial follows:

"The proportion indeed of men who have gone into service, from the undergraduate and the graduate groups, the men out of college, is so high as to menace even the wartime stability of the colleges. Nevertheless, the colleges are still planning new sacrifices for their undergraduates during the summer. Thousands are enrolling in the United States employment service, anxious to make use of all their spare time for the country and not waste their own energy by a summer of idleness. All this is what might be called the roscate side of the picture, since it reveals all as actuated by the highest patriotic principles. At the same time, as the various college officials know, and as has been made clear at the recent conferences of college presidents and other administrative officials, and as the preparatory school heads know very well also, what the colleges have done has been magnificently one-sided, they bearing all the burdens of the war, while the Government, though it incites this sacrifice in all its services, primary and secondary, has by no means cooperated with the colleges to save certain features of the situation. Of course, this lack of cooperation comes from the fact that we have no Department of Education that can work out a broad line of policy which would coordinate the colleges with all the Government departments and save the unnecessary waste of the younger men who will be needed later in the

immediate future in professional, engineering and other specialized services to the community.

"Where we ought to be strong through a central organization, we are therefore weak; and it looks as if the weakness would continue through the war, since neither Congress nor the various executives in Washington are inclined to relieve the very grave situation. What the colleges need and what they should demand is a coördinated support and not the mere lip-service of rhetorical approval for the magnificent sacrifices they are making.

NATION-WIDE ECONOMY.

To carry out the program of national economy demanded of the American people by the war they must adopt scientific and systematic methods of economy. Spasmodic and periodic saving will not fulfill the demand upon us.

One method that has been proposed and has the approval of the Treasury Department is for every American to pledge himself or herself to economize and save, and with the savings at definite periods purchase specific amounts of war-saving stamps.

We must give our Nation, we must give our men in arms, all the strength and support possible. To do this we must cut our own demands on the labor, material, and money of the country to the limit, and increase to the limit the supply of money, material, and labor available to the Government. All of our energies and resources should be devoted to the winning of the war, and to accomplish this we must economize, save, and lend to the Government.

A definite systematic plan of saving, strengthened by resolve and a pledge to save and lend to the Government, will be productive of the best results. The savings plan campaign is now on. Every patriotic American should make a pledge to save and keep the pledge.

NEW NEW YORK HEALTH LAWS.

A bureau of venereal diseases has been established by law in the New York Department of Health. The bureau may manufacture and dispense remedies for the treatment of venereal diseases. Other duties are the examination of specimens and distribution of literature for the education of the public.

A disease inspection bill has also become a law which provides for the examination of persons suspected of having infectious diseases. Persons affected must submit to a required course of treatment.

THE QUININE SITUATION.

Under date of May 13, Consul-General Fuller, at Padang, Sumatra, advised the Government that licenses to export to the United States would be freely granted for all commodities on the embargo list, which includes quinine and cinchona bark.

Dr. H. H. Rusby, in a letter to the *Paint, Oil and Drug Reporter*, reviews the cinchona situation of South America. His interesting communication concludes with the following paragraphs:

"There is, however, a far more favorable aspect to the status of the Colombian barks. While the conditions for their export are peculiarly unfavorable, those for their manufacture at certain points of their production are equally favorable. This is not an undertaking that can be expected to take care of itself, and that can be gone into on the mere strength of enthusiasm or even energy. There are many and deep pitfalls which can cause disaster. All the difficulties of manufacture under ordinary conditions are multiplied and there are new ones in addition. Nevertheless, after a close study of every condition and means of meeting it, I have no hesitation in saying that the production of quinine in Colombia constitutes the easiest method of meeting the situation confronting the United States as a result of the curtailing of our East Indian supplies. The material is sufficiently abundant to supply thousands of tons of bark annually; its manufacture there is feasible and the business can be made highly profitable by correct procedure.

"In 1885 the same situation was presented by the coca leaf and cocaine production, and I then advised the manufacture of the alkaloid at the plantations. This industry was later established and has reached great proportions and yielded rich returns. I now see the same opportunity in the case of quinine quite as clearly as I then saw it in the case of cocaine. The principals under whose direction I made my Colombian studies have now, under my advice, organized a company which plans to develop other profitable lines, but which will, I am sure, produce an abundance of quinine with great advantage to this country."

FOR ARMY WAR SERVICE BUREAU.

A bill to establish a congressional Army war service bureau to relieve members of Congress from the burdens of correspondence on military matters was introduced by Representa-

tive Sanford, of New York. Under the terms of the bill both the bureau and the War Department would be forbidden to consider a congressional recommendation for a commission or appointment, except as such recommendation bore on the character or residence of the applicant.

THE EDMONDS BILL.

R. P. Fischelis, in the *Druggists' Circular*, says, "that it is well to remember that the Congressman who favors the Edmonds Bill does so because it provides for adequate pharmaceutical service for his son and his constituent's son who are in the army."

We cannot expect a favorable report from the Committee on Military Affairs unless they are convinced that the measure provides a needful service. We are convinced that it does or this would be our last word on the subject; this conviction, however, induces us to impress upon every pharmacist to take a personal interest in its furtherance. The main thing is to have your patrons understand the purpose of the bill so thoroughly that they will at once express their views to their congressmen. It is a matter of such importance that any selfish motives would do injury to argument, plain and clear presentation of facts is all that is desired, but naturally a thorough interest in its importance must be shown. Do your part in the propaganda.

AMERICAN CASTOR BEAN CROP PROSPECTS.

Several hundred thousand acres of land have been planted with castor beans, chiefly in the South, and the crop is said to be doing nicely in most sections.

Dr. W. W. Stockberger (chairman Scientific Section, A. Ph. A.), in charge of the office of drug-plant and poison-plant investigations for the Bureau of Plant Industry, U. S. Department of Agriculture, and who is in special charge of the growing of castor beans for the Government, is on a tour of the Southern States. The plans of Dr. Stockberger when he left Washington called for a tour of six states with conferences in the principal sections of each where castor bean contracts have been let.

DR. WILLIAM MANSFIELD TO BECOME DEAN OF ALBANY COLLEGE OF PHARMACY.

William Mansfield, A.M., Phar.D., professor of histology and pharmacognosy at the

College of Pharmacy, City of New York, Columbia University, will leave the college to accept the position of dean of Albany College of Pharmacy. He will enter upon his new duties July 1. It is understood that arrangements have been entered into by the Albany college and Union College by which a complete reorganization of the college and of the teaching staff will be effected, thus affording Dr. Mansfield increased opportunities. While a distinct loss to New York college, his associates and his many friends in drug circles in this city and state are congratulating him upon this new recognition of his ability in his chosen profession.—*Paint, Oil and Drug Reporter*.

CANADIAN PHARMACEUTICAL JOURNAL CELEBRATES FIFTIETH ANNIVERSARY.

The Canadian Pharmaceutical Journal has completed fifty years of service and celebrates the event with a Jubilee Number.

G. E. GIBBARD.

There is much interesting historical matter in the issue. In a recent letter, Editor G. E. Gibbard advised that he contemplated attending the Chicago meeting of the American Pharmaceutical Association.

CHEMISTS STAND BY L. P. BROWN.

The New York Section of the American Chemical Society has adopted resolutions favoring the retention of Lucius P. Brown, who has been temporarily suspended as direc-

tor of the bureau of food and drugs, pending trial on charges growing out of Mayor Hylan's proposed reorganization of the Health Department, of which that bureau is one of the most important divisions.

The Council of the New York Academy of Sciences has adopted similar resolutions. Mr. Brown is a member of the American Pharmaceutical Association.

SON OF PROF. JOHN URI LLOYD HAS RETURNED FROM FRANCE.

The son of Prof. John Uri Lloyd, returned from France at the close of his term of enlistment, in August last, being recalled by Cornell University for the purpose of giving a series of lectures for the benefit of the Allies, a work in which he is still engaged.

FORDHAM UNIVERSITY COLLEGE OF PHARMACY ADDS FORTY-TWO MEMBERS TO THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The interest of Dean, Dr. Jacob Diner, and Prof. Gustave Horstman is noted by the number of applications from Fordham University College of Pharmacy. The additions this year number forty-two, all of them bearing the endorsement of the two members mentioned.

PURDUE'S "BIT."

The Purdue University service flag now has 1900 stars, and of these 65 are for members of the School of Pharmacy.

The men from the School of Pharmacy are classified as follows: 11 commissioned officers, 22 non-commissioned officers, one chief pharmacist (Navy), 5 pharmacists (Navy), and 25 privates. Among the commissioned officers there is one major, one captain, and nine lieutenants. They are distributed in the service as follows: 27 in the Medical Corps, 18 Infantry, 8 Navy, 3 Engineers, 3 Gas Defense, 2 Sanitary Detachment, 2 Mechanics, and 2 Aviation.

Mrs. Charles W. Johnson, wife of Prof. Johnson, of the University of Washington, died May 2, after an illness of about three weeks. Mrs. Johnson was a graduate of the University of Michigan. The husband and three children survive. The sympathy of the members of the A. Ph. A. is extended.

Dr. J. H. Dorman is a graduate of Baylor University College of Pharmacy and also of its Medical Department. Soon after the war started he enlisted in the Medical Corps of the British Army, serving first in England and then in France. When the United States

J. H. DORMAN.

entered the war he became attached to the U. S. Expeditionary Forces and he is now Chief Surgeon of a hospital "somewhere" in Italy.

William Jay Schieffelin, Jr., son of Dr. Schieffelin, member of the A. Ph. A., was married May 4 to Miss Amette Markoe, daughter of Dr. and Mrs. W. Markoe, of New York City. The groom is a first lieutenant Twelfth U. S. Field Artillery.

Max Morris, president of the Max Morris Drug Company, died at his home in Macon, Ga., April 22, of pneumonia. He was president of the Georgia Pharmaceutical Association in 1905 and 1906 and secretary from 1906 to 1910; member of the Georgia Board of Pharmacy from 1898 to 1906. Mr. Morris joined the American Pharmaceutical Association in 1898. His parents, wife, two sisters and two brothers survive him.

SOCIETIES AND COLLEGES.

THE CHICAGO MEETING OF THE
AMERICAN PHARMACEUTICAL
ASSOCIATION.

The program for the Chicago meeting will be found on pp. 466-467 of the May issue of the JOURNAL. Prepare now to participate, your papers should be in the hands of the Chairmen of the Sections thirty days in advance of the meeting and this is to be held during the week of August 12, headquarters at the Congress Hotel.

Contributors to the Sections should, if their papers are lengthy, submit with them an abstract of each, so that in the event time should not permit of the reading of the original, due consideration will be given to the work you have done.

The presiding officers and secretaries of the Sections are:

Scientific: Chairman, W. W. Stockberger, Bureau of Plant Industry, U. S. Department of Agriculture, Washington, D. C.; Secretary, H. C. Fuller, Institute of Industrial Research, 19th and B Streets, N. W., Washington, D. C.

Practical Pharmacy and Dispensing: Chairman, J. C. Peacock, Erie and Broad Streets, Philadelphia, Pa.; Secretary, R. W. Terry, Groveport, Ohio.

Education and Legislation: Chairman, C. B. Jordan, 409 Russell Street, Lafayette, Ind.; Secretary, W. F. Rudd, 1216 Grove Ave., Richmond, Va.

Commercial Interests: Chairman, R. P. Fischelis, 828 N. 5th St., Philadelphia, Pa.; Secretary, F. W. Nitardy, 66 Orange St., Brooklyn, N. Y.

Historical: Chairman, L. E. Sayre, Lawrence, Kans.; Secretary, Hugo Kantrowitz, 104 John Street, New York City.

Womens: President, Miss Zada M. Cooper, University of Iowa, Iowa City, Ia.; Secretary, Mrs. R. H. Kenaston, Bonesteel, So. Dakota.

House of Delegates: Chairman, Samuel C. Henry, 702-168 N. Michigan Ave., Chicago, Ill.; Secretary, Jeannot Hostmann, 115 W. 68th St., New York City.

Those who can do so without inconvenience are requested to send a duplicate copy of their papers with abstracts to the Editor of the JOURNAL A. PH. A., 253 Bourse Building, Philadelphia, Pa.

Chairman Charles E. Matthews, 169 N. Franklin Street, Chicago, Ill., is Chairman of the Committee on Entertainment. He will

be glad to make reservation for you. The Local Secretary is E. N. Gathercoal, 701 So. Wood Street, Chicago, Ill. A list of the officers of the American Pharmaceutical Association will be found on page 496, May issue of the JOURNAL. An application blank for membership in the A. Ph. A. is printed in nearly every number of the JOURNAL. Remember the dates of the meeting, during the week of August 12. The meetings of the National Association of Boards of Pharmacy and of the American Conference of Pharmaceutical Faculties will be held on Monday and Tuesday of the same week.

OFFICERS OF THE MANUFACTURING
PERFUMERS' ASSOCIATION OF
U. S.

President, G. A. Pfeiffer, of New York; *First Vice-President,* W. A. Bradley, New York; *Second Vice-President,* George F. Merrell, Chicago; *Secretary and Treasurer,* Walter Mueller, New York; *Executive Board, 1921,* A. M. Spiehler, Rochester, N. Y.; C. M. Baker, New York; Vincent B. Thomas, New York; 1920, Howard Goodrich, Omaha; D. H. McConnell, New York; 1919, Gilbert Colgate, New York; P. E. Page, Brooklyn.

OFFICERS OF PROPRIETARY ASSOCIA-
TION OF AMERICA.

President, Frank A. Blair, Chicago, Ill.; *First Vice-President,* W. H. Gove, Lynn, Mass.; *Second Vice-President,* Allen Moore, Monticello, Ill.; *Secretary-Treasurer,* Charles P. Tyrrell, Syracuse, N. Y.; *Executive Committee,* three years, V. Mott Pierce, Buffalo, N. Y.; J. A. Gray, New York City; two years, Carl J. Balliet, Buffalo, N. Y.; Stanley P. Jadwin, New York City; one year, A. H. Beardsley, Elkhart, Ind.; J. F. Hindes, Baltimore, Md.; Z. C. Patten, Jr., Chattanooga, Tenn.

REORGANIZED WAR SERVICE COM-
MITTEE OF AMERICAN DRUG
MANUFACTURERS' ASSOCIA-
TION.

The War Service Committee of American Drug Manufacturers' Association is now composed of the following gentlemen: Willard Ohliger, chairman, care Frederick Stearns & Co., Detroit; F. G. Ryan, secretary, care Parke, Davis & Co., Detroit; Donald McKesson, care New York Quinine and Chemical Company, New York City; Frederick Rosen-

garten, care Powers-Weightman-Rosengarten Company, Philadelphia, Pa.; W. A. Sailer, care Sharp & Dohme, Baltimore, Md.; Burton T. Bush, care Antoine Chiris Company, New York City; Dr. H. C. Lovis, care Seabury & Johnson, New York City; Milton Campbell, care H. K. Mulford Company, Philadelphia, Pa.; Dr. W. C. Abbott, care The Abbott Laboratories, Chicago, Ill.

The address of the committee is 1050 Penobscot Building, Detroit, Mich.

STATE PHARMACEUTICAL ASSOCIATION MEETINGS.

The State Pharmaceutical Association meetings for June were listed in the May issue of the JOURNAL with the exception of Maryland. The date of this meeting was named only recently and the association will convene at Buena Vista, Pa., June 25-28; Eugene Hodson, of Baltimore, is the president and E. T. Kelly, also of Baltimore, is secretary.

The July conventions are: California, at San Diego, July 8-10, W. Bruce Philip, Oakland, president, and E. A. Henderson, Los Angeles, secretary; Ohio, on steamer at Toledo, July 21-26, E. H. Thiesing, Cincinnati, president, and Theodore D. Wetterstroem, Cincinnati, secretary; Oregon, at Seaside, July 9-12, Hal J. McMair, Ashland, president, and A. W. Allen, Portland, secretary; Tennessee, at Jackson, July 9-11, Harry Mayer, Memphis, president, and T. J. Shannon, Sharon, secretary; Virginia, at Natural Bridge, July 9-11, C. H. Goldsborough, Culpeper, president, and E. L. Brandis, Richmond, secretary; Washington, on boat at Seattle, July 9-11, H. G. Duerfeldt, Spokane, president, and J. Elmer Brown, Spokane, secretary.

A CRITICAL PERIOD IN THE HISTORY OF THE MO. PH. A. IS AT HAND.

We are now in the most supreme phase. Organized in 1879 to secure a pharmacy law for Missouri, the Association has continued almost forty years in conceiving and developing still other agencies intended to promote pharmacy as a calling of vital usefulness. In 1915, we thought about the war in Europe. The year following, we commented on the great world conflict and its effect on pharmacy. In 1917, we were bewildered by this remarkable and unexpected event and scarcely realized that the United States was in the war

Today, we know that this, the greatest of all human contests, is our war and we must win it.

Today the most critical period in the history of the Mo. Ph. A. is not of such vital concern to the organization as such. We have been careful and prudent and a few years of quiescence would not kill the vitality of the Association nor blot out its accomplishments. The critical situation concerns us as human beings and as individual pharmacists. No person can escape the effects of the war and we must each and all bear a portion of the burden. So much for us as citizens of Missouri. Now, as individual pharmacists, we have the privilege and the duty of doing more for the cause than can be logically expected from the citizen at large.

Come to the Elms Hotel at Excelsior Springs, June 11-14, and with frankness, honesty and simplicity consult with your fellow members of the Mo. Ph. A. for the good it will do you and the benefit that humanity may derive. This is the hour for resolute action and intensive cooperation.

HENRY M. WHELPLEY,
Secretary.

We are printing this call because there is in it much for every pharmacist to consider. Those who have never taken any great interest in their State Association should do so this year. A wise business man exerts his greatest energy when there are difficulties in the way of his progress. The time to convince a friend of the sincerity of your friendship is when he needs a friend. The message is one for every pharmacist, a call to duty in behalf of your State Association, of the National associations.

We have added 217 new names to the list of the American Pharmaceutical Association membership this year. Will each member endeavor to add *just one more*? We are becoming experts in "going over the top;" let us apply like energy in building up *our* Association.

OFFICERS ARKANSAS ASSOCIATION OF PHARMACISTS, 1918-1919.

President, Jesse D. Hodges, Little Rock.
Vice-President, W. C. Hogan, Atkins.
Second Vice-President, F. W. McClerkin, Little Rock.
Secretary-Treasurer, Miss Mary A. Fein, Little Rock.

OFFICERS LOUISIANA PHARMACEUTICAL ASSOCIATION, 1918-1919.

President, John R. Taylor, New Iberia.

Vice-President, John N. Wallo.

Second Vice-President, W. N. Wilson, Independence.

Recording Secretary, George W. McDuff, New Orleans.

Corresponding Secretary, Miss Aurelia B. Kuhn, New Orleans.

OFFICERS OKLAHOMA PHARMACEUTICAL ASSOCIATION, 1918-1919.

President, Thomas Roche, Oklahoma City.

First Vice-President, Lee Drummmond, Dewar.

Second Vice-President, W. J. Roersia, Oklahoma City.

Secretary, F. B. Lillie, Guthrie.

OFFICERS TEXAS PHARMACEUTICAL ASSOCIATION, 1918-1919.

President, Tom Snell, Cooper.

First Vice-President, Sam P. Harbin, Richardson.

Second Vice-President, W. C. Burns, San Antonio.

Third Vice-President, W. H. Wentland, Manor.

Fourth Vice-President, Marvin Anderson, Fort Worth.

Secretary-Treasurer, W. H. Cousins, Dallas.

Home Secretary, J. W. Graham, Austin.

Trustee, R. H. Walker, Gonzales.

Historian, Miss Lum Shippe, San Marcos.

W. B. Morrison, of Waco, and J. W. Graham, of Austin, were elected life members. The 1919 meeting will be held at Galveston.

REXALL CLUBS RESOLVE TO SUPPORT THE EDMONDS BILL.

WHEREAS, It behooves every American druggist who loves his calling to do whatever lies in his power to correct the wrong unintentionally done to pharmacists engaged in the military service of the United States, through failure of the National Government to recognize the knowledge and skill of these pharmacists and their natural and commendable desire to use these for the benefit of their fellow Americans and our Allies; therefore, by the Rexall Clubs of Virginia, Maryland, Delaware, the District of Columbia, West Virginia and North Carolina, in convention assembled, be it

Resolved, That we hereby urge the Executive Committee of the International Association of Rexall Clubs to take such action as will insure that every one of the 7,000 Rexall Druggists who constitute our American membership shall exert himself to the utmost to secure the passage, by Congress, of the Edmonds bill which has this object in view.

Resolved, That the President of the Tri-State Rexall Club, Mr. H. Lionel Meredith, of Hagerstown, Md., be, and is hereby requested, to confer with President Louis K. Liggett, of the United Drug Company, for the purpose of securing his invaluable help towards the enactment of this legislation which we so earnestly desire. Having cheerfully placed their lives at the service of their country, our fellow pharmacists are anxious to make the most of whatever knowledge and skill they possess to further the endeavors of the millions of Americans and their Allies who are engaged in this great struggle, and this commendable desire certainly ought to be recognized by the Government.

THE PHARMACIST AND THE LAW

IMPORTANT FEATURES OF THE NEW JERSEY PHARMACY LAW.

Some of the important features of the new pharmacy law of New Jersey are the following:

A sign, stating the name of the registered pharmacist in charge thereof, must, on and after July 4, 1918, be displayed on or in front of each Pharmacy in this State.

Biennial re-registration is required and the fee thereof is \$1.00; a notice will be sent to each registered person before the date on which the next re-registration fee will be due.

Applicants for examination for Registered Pharmacist's registration must, on and after September 1, 1920, have been graduated from an approved College or School of Pharmacy.

The Board of Pharmacy is granted authority to revoke certificates of registration on certain specified conditions, *i. e.*, after each accused person has been served with a copy of the complaint and has been given a hearing before the board and has been found guilty of any of the following charges:

When the registration is shown to have

been obtained by misrepresentation or fraudulent means, or

When the registrant is guilty of chronic or persistent inebriety or addiction to the use of narcotic drugs, or

When the registrant has been twice convicted of violation of Chapter 197, P. L., of 1908, and the amendatory acts thereto, commonly known as the "Anti-narcotic Act," or

When the holder of the certificate has been found guilty of continuous and wilful violations of this or any other statute relating to the practice of pharmacy.

Provision is made for reciprocal registration.

BEVERAGE AND FRUIT SYRUPS NOT SUBJECT TO LICENSE.

Among the food commodities subjected to license by the President's proclamation of October 8, 1917, were "sugar, syrups and molasses."

The syrups intended to be licensed were so-called "table syrups" and not beverage syrups or fruit syrups, or medicinal syrups. It is therefore ruled that beverage syrups or fruit syrups, which include coca cola and other beverage syrups and soda water syrups, and medicinal syrups, are not licensed commodities and neither manufacturers nor distributors of such syrups are required to obtain a license to make or handle them.

USE OF SACCHARIN ALLOWED IN CARBONATED BEVERAGES IN TEXAS

According to an announcement made by Texas Food Commissioner saccharin may be used in carbonated beverages in Texas. The statement issued by him reads: "Due to abnormal conditions existing, ruling No. 12 forbidding the use of saccharin in beverages is hereby suspended until further advised. You are respectfully notified that saccharin may be used in carbonated beverages, provided the product is labeled in such a way that will clearly indicate to the consumer that it has been artificially sweetened with saccharin."

NARCOTIC NEWS AND REGULATIONS

Draft examinations are discovering a large number of narcotic addicts, according to Representative Henry T. Rainey, of Illinois, chairman of the Narcotics Committee appointed last March by the Secretary of the

Treasury on the recommendation of Daniel C. Roper, commissioner of Internal Revenue.

The alarming prevalence of the use of narcotics has been a revelation to the members of this committee, several of whom thought that they had a pretty fair idea before of the number of users of habit-forming drugs.

To prevent a use by which illicit distributors of habit-forming drugs have been able to buy at auction unclaimed packages of drugs from express companies, the Internal Revenue Bureau has issued a ruling that railway and express company agents hereafter must notify revenue collectors of auction sales of unclaimed articles. Packages containing narcotics will be sold only to physicians or pharmacists registered under the Harrison drug act.

Dr. Charles A. Rosewater, who was engaged by Dr. Oscar Dowling, president of the Louisiana Board of Health, to make an investigation of the use of habit-forming drugs in Louisiana, has sent in his report, declaring there are about 18,000 persons using drugs. He makes these recommendations:

"To provide immediate relief from suffering and financial ruin, the State should immediately acquire a supply of morphine and opium, to be furnished addicts in quantities necessary for their physical support, at cost, under strict regulations, to guard against abuse.

"In carrying out these provisions trusted physicians in each locality must cooperate with the State Board of Health in order that there may be no unnecessary suffering, and that the addicts be encouraged to help themselves, and in order that the curable cases can be weaned from the drug as rapidly as possible."

Dr. Rosewater recommended that the State Board investigate the soft drinks containing caffeine dispensed throughout the State.

The Federal officers in the miscellaneous division of the Internal Revenue Bureau are prepared to contest the decision of the United States Circuit Court in Illinois that Section 2 of the Harrison Narcotic law is unconstitutional, but they do not believe it will be necessary to get a special Supreme Court decision in that particular case against A. L. Blunt.

A. L. Blunt, of Chicago, was convicted on 13 counts for violation of the Harrison act. The section of the law held unconstitutional was Section 2, and the principle involved is the one under which the punitive clause of the law was successfully attacked some months ago, that the provision is foreign to the revenue

portion of the act, and is an interpolation of police power in a purely revenue measure.

District Judge Daniel Fish, in Minneapolis, decided that physicians are prohibited from supplying habitual users and may issue to them only prescriptions for curative purposes.

The trade interests and the Federal authorities believe that illegal traffic in narcotic drugs got a severe setback in this judicial decision.

URGES NEED OF NATIONAL TRADE-MARK.

The need of a national trade-mark was urged May 27, at the spring meeting of the National Retail Dry Good Association at Chicago, a special address on the subject being delivered by Chauncey P. Carter, of the Bureau of Foreign and Domestic Commerce, Department of Commerce, who had an important part in drafting the National Trade-Mark Bill now before Congress.

"One reason why a national trade-mark would be of great benefit to the American manufacturers," explained Mr. Carter, "is because there is so much legalized piracy of private trade-marks in foreign markets. The average manufacturer in this country does not consider export business until he has begun to exhaust the possibilities of the home market. In the meantime it never occurs to him that he ought to protect his trade-mark in foreign countries. See what happens, though: A New York exporter purchases some of his products and sends them to a certain country in South America. The buyer there finds that they will sell well and writes back to the New York exporter for an exclusive agency. Naturally, the exporter is not able to give him an exclusive agency nor is he anxious to put him in direct touch with the manufacturer. What does the South American merchant do then? He finds that the manufacturer's trade-mark is not registered in his country, so he takes out a registration in his own name. Some years later the manufacturer decides to enter the export field; he inserts advertisements in export journals and soon secures an order from a reputable concern in that same South American country. The order is accepted and the goods shipped, but lo and behold! when they reach their destination they are confiscated and held upon complaint of the other merchant, who cites his trade-mark registration as proof of his ownership of the mark, also adducing evidence

to show that he was the first user of the mark in his country. And he has the law on his side.

"If we had a national trade-mark, owned and protected by our Government, this American manufacturer could outwit the pirate merchant by merely substituting the national trade-mark for his private mark on all shipments to that country."

Other reasons were advanced for the adoption of a national trade-mark, and issue was taken with those who would make the use of such a mark compulsory. The mark should be granted, it was urged, only to the manufacturers of goods that reflect credit on the industries of the country.

It was also pointed out that the measure providing for a national trade-mark was only one of a number now being put in shape and considered by the Department of Commerce with a view to preparing the American manufacturer and exporter to hold his own in the struggle for world trade that is expected to follow the making of peace.

PROPOSED BRITISH TRADE-MARK LAW.

There is a bill in the British Parliament which provides that if the owner of a trade-mark so uses it as to lead the public to regard it as the name of an article it shall be removed from the register of trade-marks. It is understood that British manufacturers are taking steps to oppose the bill, but should it be passed American articles which have been popularized through name trade-marks might be subjected to imitation under the same name. The American consul general in London has been requested to look into the matter, and if the situation is as serious as reported, manufacturers will ask the State Department to take up the question of protecting American interests.

The provision of the British bill is in substance that when a trade-mark becomes so well known that the public use it as a common name the trade-mark shall become public property. This result is made to depend solely upon the action of the public over whom the trade-mark owner has no control. The proprietor of the trade-mark is given a period of four years in which to induce the public to change its habits, but experience has shown the futility of attempting to accomplish a change in the use of words by the public. The result may be the confiscation and dedication to the public in Great Britain of the most valuable American trade-marks.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGE OF ADDRESS SINCE APRIL 2, 1918.

KOLAR, GUSTAV S.,

From 1801 Millard Ave., Chicago, Ill.

To 6 S. Seeley Ave., Chicago, Ill.

BOOK NOTICES AND REVIEWS.

Year Book of the American Pharmaceutical Association, 1916, Volume V, containing the Fifty-ninth Annual Report on the Progress of Pharmacy, and Constitution, By-Laws and Roll of Members of the American Pharmaceutical Association, corrected up to January 28, 1918. The Year Book corresponds to Volume LXIV of the former proceedings of the Association. Frontispiece, Frederick J. Wulling, 64th President of the American Pharmaceutical Association. The volume is bound in cloth, 618 pp., price, \$4.00. Chicago, Ill., 1918.

The Reporter on the Progress of Pharmacy is Henry V. Arny and the collaborators are: Charles W. Ballard, Karl S. Burkett, Zada M. Cooper, Brooke J. Davis, George C. Diekman, Hermann Engelhardt, Robert P. Fischelis, Henry J. Goeckel, Fanchon Hart, Julius A. Koch, William A. Puckner, Otto Raubenhimer, Louis Saalbach, Hugo H. Schaefer, Clyde M. Snow and John H. Wurdack.

The Reporter states in the Introductory that the preparation of the abstracts for this Year Book was made difficult by the absence of practically all journals from Germany,

Austria and even Switzerland. Abstracts from these sources were obtained from English, French and Dutch journals and notably from *Chemical Abstracts*, the editorial staff of which was able to secure sets of the 1916 journals from the Teuton nations. The proper credit is attached to each abstract printed on the pages which follow:

By employment of these aids, the present Year Book is about as comprehensive as its predecessors. The Reporter expresses his appreciation of the enthusiastic coöperation of his collaborators and his personal loss occasioned by the death of Martin I. Wilbert, a collaborator on the Report on the Progress of Pharmacy since 1911.

Aside from the fact that the above statements offer some information that would be part of a review, the Association desires that due acknowledgment be made to those who have contributed to this valuable work for American pharmacists. This volume presents the abstracts for 1916 and the work on the next one is well under way. It should be remembered that a Year Book can not be completed until some time after the year's activities have closed. The British Year Book closes in mid-year, but we consider the plan of the A. Ph. A. better in this respect.

As far as a review of the book is concerned it would be necessary to repeat much of that which was written relative to former editions. The arrangement does not differ materially from the previous volume, the work has been done carefully, the printing and binding of the book is good. There are nearly 2000 references in the Subject Index and that of the authors has about 1000 names, all of which speaks for the extent of the work represented in the preparation of the book.

We are at a loss to make any suggestions that would improve the work so ably done by the Reporter and his efficient co-workers. The members have heretofore expressed their appreciation of the Year Book and this same approval will be given to the present volume.

E. G. E.

Year Book of Pharmacy (British), comprising, abstracts of papers relating to Pharmacy, Materia Medica, and Chemistry contributed to British and foreign journals from July 1, 1916, to June 30, 1917, with the transactions of the British Pharmaceutical Conference at the 34th annual meeting held in London, July 11, 1917. 12 mo., 438 pages, cloth. London, J. & A. Churchill.

J. O. Braithwaite is the editor of the Abstracts, Thomas Stephenson compiled the New Remedies Section and Reginald R. Bennett is the editor of the Transactions. As a frontispiece, the volume carries a portrait of Charles Alexander Hill, B.Sc., F.I.C., president of the Conference for 1917-18. His presidential address on "Our Medicine Supply in War Time" appears in full in the section of the book devoted to the proceedings of the Conference.

A Research List is included, presenting subjects for investigation. The following are two of the questions submitted, relating to belladonna root: "In what respects, if any, does a tincture from the fresh root differ in its composition and action from one of the dried root?" "Parcels of Indian belladonna root have given abnormal figures on analysis, indicating some base of a lower molecular weight than atropine. An investigation of this drug is required."

Three hundred and fifty pages are devoted to Abstracts. The arrangement of the subjects differs from the A. Ph. A. Year Book, but the purpose is the same to present the matter abstracted in convenient form for reference. Abstracts from German sources are few but the American journals have received correspondingly more attention. The first division is concerned with chemistry while pharmacy comes third. The index is complete, but there is no separate authors' index. Fifty-two publications have received attention by the authors on whom the work reflects great credit. Doubtless the Year Book meets with the same appreciation in Great Britain that is accorded to our own by American pharmacists.

E. G. E.

Proceedings of the National Wholesale Druggists' Association—Forty-third annual meeting held at Chicago, Ill., October 1 to 4, 1917.

This issue of the Proceedings of the National Wholesale Druggists' Association has more pages than those previously published. Primarily this speaks for a large volume of business transacted at the Chicago convention.

The report on legislative measures and rulings under the Harrison law are of particular interest to all druggists. As the activities of wholesalers and retailers are closely linked the very complete reports of various committees can be studied with profit by the latter.

Officers and committee members grace the first pages of the volume, and those succeeding list present and past officers. The Asso-

sociation has 251 active members and 336 associate members. The next convention of this Association will be held in New York City during the week of October 7, 1918.

State "Pure Drug" Laws enacted since the passage of the National Food and Drugs Act, June 30, 1906, with a reprint of said act as amended. 8vo., 732 pages. Compiled by the Proprietary Association of America and the National Wholesale Druggists' Association.

In compiling the laws affecting the drug business the National Wholesale Druggists' Association and the Proprietary Association of America perform a valuable service for the drug trade. The related laws of the Government, all States and U. S. Territories, as well as Cuban decrees and some municipal regulations are either printed in full or in extensive abstract. The compilation is useful for every druggist and more particularly for members of legislative committees. While the work is done for the benefit of the members of the participating associations, the service is by no means thus restricted and therefore the acknowledgment made at the beginning.

Practical Pharmacy for Pharmacists and Physicians.—A text-book for Students in Medicine and Pharmacy. Second Edition. By Birdsey L. Maltbie. Cloth, 6 by 9 inches, pages 400, \$3.00. Distributors, The Druggists' Circular, 100 William Street, New York, 1917.

The distributors say of this book that it represents the author's endeavor to supply a condensed treatise on pharmacy, something more useful than the "quiz" books and yet less voluminous than the standard works on Pharmacy.

The book is divided into five parts and these are devoted to Pharmaceutic Operations, Galenic Preparations, Chemicals and Their Preparations, Products of Plants and Incompatibilities. A number of convenient and useful tables are included. The book is well adapted for students who desire to review, preliminary to further and more thorough study. It is also useful as a reference book for physicians. The volume contains nearly 400 pages, is well printed and bound in buckram.

THE FAIRCHILD SCHOLARSHIP AWARD POSTPONED.

To the Pharmacy Schools and Boards of Pharmacy:

The notice of postponement of the Fairchild Scholarship Award is printed on page 555 in this issue of the JOURNAL. Chairman H. C. Christensen, 4149 Vincennes St., Chicago, Ill., desires that due notice be given of such postponement until the Convention of the American Pharmaceutical Association in Chicago during the week of August 12, when the Committee, of which he is Chairman, and the Fairchild Scholarship Committee will come to a decision relative to the method of award and selection of the candidate.

In the meantime schools of pharmacy should prepare records of the qualifications of their leading students for the Fairchild Scholarship in line with Recommendation 5 of President R. A. Lyman's address, and which reads:

"Recommendation No. 5.—That it be the sense of the Conference that Mr. Fairchild could render the greatest service to pharmacy by offering the scholarship to a graduate pharmacy student, in order that he might pursue some research problem for one full school year, in the school of his choice; and further, that this scholarship be awarded on the basis of the applicant's scholastic training, his standing as an undergraduate pharmaceutical student and upon his fitness to do research."

The action of the joint bodies at Indianapolis is recorded in the minutes of this meeting on pp. 60-64, inclusive, of the January issue, 1918, JOURNAL A. PH. A. A careful study of these pages is suggested.

It would seem advisable that the schools decide on the eligible candidates for the Fairchild Scholarship. It is also advised that a record be kept of the preliminary education possessed by the prospective candidates, of their pharmaceutical training and education, and of their ability to do research work.

The suggestion has been made, although this has not, as far as we know, been definitely agreed upon, that each School of the Conference propose *one* candidate, and that the deans of the Schools furnish the Fairchild Scholarship Examination Committee with data which will form the basis of their decision.

Doubtless Chairman Christensen will notify all Schools of the Conference, as promptly as is possible, of the conclusions reached by the Committee, and make definite requests for information from them that is necessary for making the award. The plan does not contemplate any other examination.

Schools and Boards of Pharmacy should confer with Chairman H. C. Christensen, whose address is 4149 Vincennes St., Chicago, Ill.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be typewritten and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Memberships: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE.

| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. |
|-------------|-------|-------|--------|--------|---------|
| 50 | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 |
| 100 | 1.76 | 3.52 | 5.28 | 7.04 | 1.54 |
| 150 | 1.98 | 3.96 | 5.94 | 7.92 | 1.82 |
| 200 | 2.20 | 4.40 | 6.60 | 8.80 | 2.09 |

Orders may be sent to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1917-1918.

President—Charles Holzhauser,* Newark, N. J.

Acting President—Alfred R. L. Dohme, Baltimore, Md.

Honorary President—W. L. Dewoody, Pine Bluff, Ark.

Second Vice-President—Leonard A. Seltzer, 32 Adams St., W. Detroit, Mich.

Third Vice-President—Theodore J. Bradley, 70 St. Botolph St., Boston, Mass.

General Secretary—William B. Day, 701 So. Wood St., Chicago, Ill.

Treasurer—Henry M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Reporter on the Progress of Pharmacy—H. V. Army, 115 West 68th St., New York, N. Y.

Editor of the Journal—E. G. Elberle, 253 Bourse Bldg., Philadelphia, Pa.

Local Secretary—E. N. Gathercoal, 701 So. Wood St., Chicago, Ill.

Chairman of the Council—Lewis C. Hopp, 1104 Euclid Ave., Cleveland, Ohio.

Secretary of the Council—J. W. England, 415 North Thirty-third St., Philadelphia, Pa.

* Deceased November 19, 1917.

HENRY KRAEMER, Ph.C., Ph.B., Ph.D.
ANN ARBOR, MICH.

President of American Conference of Pharmaceutical Faculties, 1917-1918

HENRY KRAEMER

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

JULY, 1918

NO. 7

HENRY KRAEMER.

Henry Kraemer, president of the American Conference of Pharmaceutical Faculties for 1917-1918, was born in Philadelphia, Pa., July 22, 1868, the only son of John H. and Caroline Kraemer, both of whom died before Henry was four years old. At the age of nine years he was admitted as a pupil of Girard College from which institution he graduated in 1883, receiving the award of scholarship. His attachment for the College is disclosed in a number of contributions published in the *Girard College Record*, and the high esteem in which he is held by his *Alma Mater* is confirmed by expressions of the faculty, officials and alumni, and by his selection as one of the speakers on Founder's Day and other occasions that mark events of this great institution.

While serving his apprenticeship, in the store of Prof. C. B. Lowe, he attended the Philadelphia College of Pharmacy and graduated in 1889. The subject of his thesis was "A Microscopical and Chemical Study of White Oak Bark;" in recognition of this work he was awarded the John M. Maisch microscope prize and also the Henry C. Lea prize. During his senior year at the College he was assistant to Prof. Samuel P. Sadtler at the University of Pennsylvania, and the year after his graduation in pharmacy he was appointed instructor in botany and pharmacognosy in the New York College of Pharmacy. While residing in New York he took a special course in botany at Barnard College, Columbia University, under Dr. Emily L. Gregory.

In 1891 he matriculated in the School of Mines, Columbia University, graduating in 1895 with the degree of Bachelor of Philosophy. This same year he was appointed professor of botany, pharmacognosy and materia medica in the School of Pharmacy of Northwestern University; he was, however, granted one year's leave of absence before entering on his duties. This year was spent at the University of Marburg, Germany, most of the time being devoted to the study of botany under Prof. Dr. Arthur Meyer. He also attended the lectures on philosophy by Professor Cohen; on chemistry by Professor Zincke, and those on physics by Professor Melde. He was granted the degree of Doctor of Philosophy after passing the required examinations and he gained the distinction of *cum laude*. His inaugural dissertation, presented to the Philosophical Faculty of the University, was on "*Viola tricolor* L., in morphologischer, anatomischer und biologischer Beziehung."

After returning to the United States Professor Kraemer assumed the duties at Northwestern University where he remained one year when he was elected

to the chair of botany and pharmacognosy in the Philadelphia College of Pharmacy, a position he continued to hold until last year when he accepted the chair made vacant by the decease of Prof. J. O. Schlotterbeck in the University of Michigan.

A sketch of Professor Kraemer in the *American Journal of Pharmacy* (1908) has been drawn upon for these data and therein some of his other activities are listed: Member of the Revision Committee of the U. S. Pharmacopoeia from 1900, chairman of its sub-committee on botany and pharmacognosy; instructor in microscopical botany in the summer course in botany given by the Torrey Botanical Club and the College of Pharmacy of the City of New York, 1890-92; chairman of the Committee on Field Meetings of the Torrey Botanical Club, 1891-92; instructor in botany in the Natural History Camp for Boys under the direction of the Worcester Natural History Society, at Wigwam Hill, 1892; editor of the *Alumni Journal*, New York College of Pharmacy, 1894-95; editor of the *American Journal of Pharmacy*, 1899-1917; Reporter on the Progress of Pharmacy, A. Ph. A., 1892-95; collaborator on *Pharmaceutical Review*; member of the scientific staff of the Marine Biological Laboratory at Wood's Hole, Mass.

Among his affiliations the following are named: Life member of the International Botanical Society, Botanical Society of America, the American Philosophical Society, the American Association for the Advancement of Science, the Philadelphia Academy of Natural Sciences, the American Pharmaceutical Association, Columbia University Club, Philadelphia College of Pharmacy, American Society for Extension of University Teaching, Wild Flower Preservation Society of America and a number of alumni associations, also member of numerous other organizations.

Membership in some of these societies referred to may with some individuals indicate only eligibility, but Professor Kraemer's affiliation signifies more, it means his active participation in promoting the purposes of the respective organizations, and so a list of the titles of his publications and addresses made up six printed pages in the publication referred to. Many of the papers are subjects of editorials in the *American Journal of Pharmacy*, and reports of his research work in this journal. The pages of the A. Ph. A. Proceedings record others and a number are contributions to other pharmaceutical journals. But aside from these writings, many made their first appearance in *Science*, *Bulletin of the Torrey Botanical Club*, *Journal of the American Chemical Society*, *Botanical Gazette*, *Pharmaceutical Journal* (London), *Proceedings Academy of Natural Sciences*, *Proceedings American Philosophical Society*, *Torrey*, *Journal of the American Medical Association*, *Transactions of the Eighth International Congress of Applied Chemistry* and various State Pharmaceutical Association proceedings. The wonderful capacity for valuable work by the subject of this sketch is manifest. In this connection his assistance in the last two revisions of the U. S. Pharmacopoeia is considered and also the preparation of the first editions and later, revisions of his well-known books: "A Course in Botany and Pharmacognosy," "A Text Book of Botany and Pharmacognosy," "Applied and Economic Botany," "Scientific and Applied Pharmacognosy" and "Outline of Courses in Botany, Microscopy and Pharmacognosy." He also is one of the editors of the U. S. Dispensatory.

Professor Kraemer's investigations relate largely to botanical and pharmacognostical subjects but not by any means restricted to purely scientific research. Last year he delivered a lecture before the Section on Commercial Interests, A. Ph. A., in which he most interestingly presented the commercial value of pharmacognosy, showing that by its technic constituents of preparations in powder form may be identified and brought his subject into a relation with color schemes in drug store adornment and window dressing. So while his interest is in the science he has not lost sight of its practical application and commercial value. Much of his work has been concerned with pharmacography and pharmacognosy of powders with a purpose of devising means of identification and

standardization, and not only in this connection has he investigated colors but also relative to the origin and nature of the coloring matter in growing plants. Color photography has occupied much of his time and the numerous photographic plates he has developed speak for his industry and deep interest, and altruism also—for he contributes the results of his research to students and readers, many of whom have slight comprehension of the number of hours required for these investigations. The starches as well as other plant constituents that now serve as diagnostic characteristics are considered in a number of his reports and papers.

While we regard Professor Kraemer as a scientist he does not lose sight of passing events and he is a close observer, evidenced, for example, by his recent address on "*Kultur vs. Culture*" before the last annual meeting of the American Drug Manufacturers Association, and also such papers as "*A New Method of Education*," "*Life in a German University*," "*The Survival of Justice and Unselfishness*," "*Recreation*," "*The Retail Pharmacist as a Purveyor of Pure Drugs*," etc. Without endeavoring to define Professor Kraemer's views of success and achievement the following is quoted from the closing remarks of his address referred to in the opening lines of this paragraph: "It is comparatively easy for a man to produce a master work, but it is difficult for him at the same time not to get out of touch with his fellows." From this we make the deduction that among his aims are the acquisition of useful knowledge, the communication of it to others and to remain in touch with his fellows. E. G. E.

LOYALTY TO THE COUNTRY AND TO PHARMACY.*

A GUIDE.

TO respect my country, my profession and myself.

To be a loyal citizen, to speak of my country with praise, and act always as a trustworthy custodian of its good name.

To be devoted to the cause of pharmacy, to lend my best efforts to its uplift and advancement.

To promote association work and thereby improve the service of pharmacy.

To be a pharmacist deserving of the respect and confidence of those whom I serve.

To look upon service in and for pharmacy as an opportunity to be seized with joy and made the most of, and not as a painful drudgery to be reluctantly endured.

To believe in pharmacy heart and soul, to be optimistic relative to its mission, and convey assurance of its importance to those who are served thereby.

* The Guide from a paper by E. G. Eberle under above title, read before Pennsylvania Pharmaceutical Association, June 26, 1918.

EDITORIAL

E. G. LEBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

THE CHICAGO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

THE indications thus far are favorable for a good and certainly an interesting meeting of the American Pharmaceutical Association, during the week of August 12.

Chairman Matthews, Local Secretary Gathercoal and the Committees under their direction have been doing excellent work, and all the pharmaceutical journals have been generous in giving publicity relative to the meeting. Considering that within distances of a few hundred miles from Chicago there are a score of large cities and many with a population of 5,000 or more, and also that the Association has not met in Chicago since 1893, it is reasonable to assume, even under present conditions, that the Convention will be well attended.

According to reports from several State Association meetings the registrations exceeded prior expectations, which is convincing that pharmacists recognize their duty in such attendance, especially this year, when many would gladly have come who could not because of the shortage of help. This condition will have its effect on the meeting in Chicago, therefore it is to be hoped that members will exert extraordinary efforts to be present.

There are more vital questions that require attention this year than ever before in the history of American pharmacy. The one previously indicated is not of least importance, because it concerns the boards of pharmacy and schools as well as retail pharmacists. How will the present shortage of help and the further depletion be met?

Other timely topics relate to alcohol regulations, means and methods of conservation, the war revenue measures, explosives law, contemplated health insurance laws, and bills for regulating the dispensing of remedies for venereal diseases. The Section on Education and Legislation can well afford to assign an entire session, or the greater part of one, for a discussion of these problems, and the derivable value will more than repay members for their attendance. In fact, their importance suggests the expediency of holding a meeting of representatives of State Associations in the House of Delegates for joint action on these matters, as all of their constituents are concerned relative to these provisions and projects.

Other phases of the same questions will find place on the programs of the other Sections, and the coördination and utilization of these discussions and papers contribute to greater efficiency among pharmacists and the advancement of

pharmacy. Those who specialize in any of the branches concerned with pharmacy are specialists; they render a very essential service; the retail pharmacists are generalists—they seek information from all of these sources for their needs in the practice of pharmacy.

There are other subjects equally or more important, as, for instance, the promotion of a pharmaceutical corps in the U. S. Army, as a part of its Medical Department, the adequate representation and coöperation of State Pharmaceutical Associations in the House of Delegates, and a consideration of the advantages to be derived by federating the associations of all the drug industries. Relative to the latter proposition your attention is directed to a paper in this issue by Chairman H. V. Army of the committee having this important matter in charge. Presentations and outlines of the plans have heretofore appeared in the Journal, in the messages of President Dohme, and as part of Ex-President Wulling's address, last year. A careful study of the subject will enable members to participate in the discussions and to lend their counsel.

The call is to attend the Sixty-sixth Annual Convention of the American Pharmaceutical Association in Chicago, during the week of August 12.

Do your best! Come!

E. G. E.

STANDARDS OF PHARMACY SHOULD BE UPHELD. PHARMACY STUDENTS OF DRAFT AGE SHOULD BE GIVEN OUR CONSIDERATION.

Pre-pharmaceutical education needs adjustment—"high school education or its equivalent," is indefinite. The "preliminary drug store experience" may signify a splendid preparatory training for the courses in pharmacy schools or, have little value. It is possible to standardize the first requirement but the latter presents a more difficult problem as the opportunities for training the prospective pharmacy students in drug stores differ as do the inclinations of those who are employed in them.

It is necessary for legal and other reasons to fix an age at which a person acquires certain rights not given to a minor, but this does not necessarily mean that a person of twenty-one years is better qualified for service in pharmacy than one a year younger. Experience and age have a relation to how the individual has employed his time and his ability and capacity for acquiring knowledge. The object is not to minimize the value of experience nor of age but to point out that these two requirements of the prerequisites for practicing pharmacy can be shaded in times like the present, provided, that the exigency for doing so exists and, more specifically, out of consideration for those who will enlist soon after graduation. There has been a depletion of pharmacists, and many others will answer the country's call; they should not be unnecessarily handicapped when they return

from service, so every reasonable opportunity, that does not do injury to the standing of pharmacy, should be given those under the draft age, before going abroad, for completing their education and securing their credentials as pharmacists. Such consideration enlists our immediate interest and may, perhaps, present a duty we owe them and pharmacy; the lowering of educational standards, however, for entrance or graduation requirements or for boards of pharmacy examinations would be deplorable.

A contemporary, in a recent issue, reported a statement from a Government official to the effect that there were only about eight reputable schools of pharmacy in the United States. Such a charge and every other aspersion of this kind should be answered. Charity would suggest that this statement was made without a knowledge of the facts. There is a tendency to remove the need of educational qualifications from pharmacy and it is therefore of greatest importance that the standards of pharmacy not only be maintained but advanced.

Notwithstanding that pharmacy has for many years been deemed necessary to medical practice, that pharmacists have provided the standards for medicines employed by physicians, have met every requirement, there is the inclination, tinctured with selfishness, to belittle its service, in fact, to ignore pharmacy and pharmacists. And to progress backward now would produce the arguments desired by the proponents.

Pharmaceutical education is in the process of standardization, it should not be impeded but the strongest encouragement should be given thereto, war or no war. The very fact that we desire the Government to grant pharmacists recognition by the establishment of a pharmaceutical corps makes such course even more necessary. While this is desirable and pharmacy is entitled to such recognition the point is that pharmacy deserves such support, progressive medicine requires the aid of progressive pharmacy and the people are entitled to the very best service pharmacy can render.

If it should finally be deemed necessary, for the special reason assigned, to grant concessions to students for admission to colleges of pharmacy, then let the entrance requirements be for a lesser number of years of experience, but this of a kind that has greater value in pharmacy; age of the student has a direct relation, but the number of years do not count for so much as how this time has been utilized. The courses in pharmacy should be progressively advanced and the preliminary educational requirements should be raised as fast as practicable. We can theorize as much as we like but the facts and the conditions must be faced.

Drug stores fill an important place in commercial life; in many of them pharmacy is insignificant and unprofitable and it would be far better for the proprietors to discontinue such service, if it can be done without inconveniencing the public.

Other stores can arrange their service so that a lesser number of pharmacists will be employed by assigning them to supervisional duties and to work that must be done by qualified pharmacists.

As far as educational requirements are concerned, let pharmacy go onward not backward. With this thought in mind let us give every possible consideration to the young pharmacists who enlist in the service of our country.

E. G. E.

THE FEDERATION OF PHARMACEUTICAL BODIES.*

BY H. V. ARNY.

It was the writer's fortune or misfortune to be honored with the chairmanship of the committee appointed by President A. R. L. Dohme, of the American Pharmaceutical Association, to consider the federation of American pharmaceutical organizations under the aegis of the oldest national pharmaceutical body in the country, the A. Ph. A. This Federation Committee began its work the early part of the current year and is still continuing its deliberations.

The idea of a federation of the several national bodies representing various branches of the drug trade was put forward by Henry P. Hynson, in 1916, in his masterly address as chairman of the house of delegates of the A. Ph. A. Dr. Hynson's idea was to make the house of delegates the rallying point at which all pharmaceutical bodies, including State pharmaceutical associations, could gather to their mutual advantage.

In his presidential address at Indianapolis last year, President F. J. Wulling discussed at length a plan of federation in which a Greater A. Ph. A. in conjunction with other national bodies would form a great organization of far-reaching influence, with journals, research laboratories and other means of disseminating pharmaceutical knowledge. He expressed the opinion that the raising of one million dollars for these beneficent purposes was a task by no means impossible.

Since assuming the presidency of the A. Ph. A., by reason of the untimely passing of our dear friend, Mr. Charles Holzhauer, Dr. A. R. L. Dohme, with his characteristic energy, has gone into the federation idea with all of the enthusiasm for which he is noted. He has submitted a plan of federation that is familiar to most of us here present, since it has been given prominence by the pharmaceutical press during the past few months. Briefly summarized, Doctor Dohme's plan proposes federation more quickly than can be expected if the project is to depend upon the prior raising of a large sum of money. He believes that the present national drug associations, with their already existing machinery of organization, with the wealth behind some of them, the numbers behind others, can be federated into a great body wielding tremendous influence, potential of great good to the public as well as to pharmacy. His plan employs for the federating, the present Council and House of Delegates of the A. Ph. A., with, of course, amended personnel and with enlarged powers. He also suggests several bureaus of service; a bureau of chemical aid and research, a bureau of legal information, a Bureau of employ-

*Read at meeting of New Jersey Pharmaceutical Association, June 1918.

ment, a bureau for the exchange of certain goods and last, but most important, a legislative bureau designed to protect pharmacy from the continual assaults made against its interests by overzealous or half-baked legislation.

That Doctor Dohme's plan is highly attractive goes without saying; that it will be difficult to accomplish is obvious; but that it is impossible as some of its critics seem to think, is not the opinion of the writer, who has been forced by his work on the Federation Committee to give it careful attention.

It would be the height of bad taste for the writer or any member of the Federation Committee to express positive opinions as to details of any federation plan until the committee as a whole has arrived at some positive conclusions. The problem is too big to decide in a few weeks or even a few months. Our committee has already learned that it is well-nigh impossible to arrive at a decision by mail; hence plans are now being inaugurated to hold a committee conference in Chicago prior to the meeting of the A. Ph. A. in August.

On the other hand, a discussion of the general features of federation is both timely and important and this paper is being read for the main purpose of finding out the opinions of the members of this Association on the subject; to begin a discussion that may be of value to the Federation Committee in arriving at conclusions. In beginning this discussion the writer will quote what he has published elsewhere on the subject:

The general idea of federation is worthy of our most serious consideration, for the plan is laden with tremendous possibilities for good, if wisely planned, and is fraught with distinct danger if carelessly and hastily contrived.

No one can gainsay the immense influence that could be wielded by a united pharmaceutical America, retail, wholesale and manufacturing, when banded together in a common cause. Think of the legislative influence that could be wielded by the 100,000 Americans directly or indirectly interested in the drug trade, if welded into a flexible whole. Again, think of the possibilities of pharmaceutical betterment suggested by a huge federation with means enough at its disposal to conduct laboratories, legal bureaus and other aids available to every member of the federation. Most alluring is the picture thus presented.

On the other hand, the creation of such a federation will be accompanied by many difficulties. How can such diversified interests as manufacturing, wholesale and retail pharmacy, get together upon a broad basis of mutual agreement? It can be done only by settling upon points of agreement and by leaving the points of disagreement to the separate trade organizations. The differences of view-point existing among the various lines of pharmaceutical endeavor are no farther apart than are the view points of Oklahoma and New York, let us say. The experiment of federal government has stood the test of over a century, including a veritable test by fire, the Civil War. The success of this national federation of conflicting interests is largely due to the fact that basic principles of our Government are a federation for mutual defense; a confederation for mutual benefit. As long as our Government stands for these two principles, as long as it abstains from attempts to force the local opinions of New York upon Oklahoma, and *vice versa*, its success is assured.

In the proposed pharmaceutical federation, the same spirit should prevail. We have ever with us a need of defense in the thousand different kinds of legislation that zealots outside of the calling try to force upon the trade. The first principle of the federation should therefore be uniformity in legislative matters and a strong committee consisting of members of the legislative committees of the several national associations should be the first duty of the federation. The Drug Trade Conference has shown what can be done in this line when action is based on mutual interests rather than class advantages, and if the pharmaceutical federation becomes an accomplished fact, it will take over the present functions of the Drug Trade Conference.

One of the greatest bonds that binds the several States of our Union together is the service rendered by the Federal Post-Office Department and similar bureaus whose heads form the

National Cabinet. Even so, if the pharmaceutical federation is to succeed, it must have service features that can be used by all diversified branches of American Pharmacy. As mentioned above, it is in this direction that the Dohme plan is peculiarly attractive.

That is as far as the writer cares to go in expressing, for the present, his views of the proposed federation. He desires to hear the views of others, notably of those who have had active connection with other national pharmaceutical bodies, which must be included in the federation if it is to be a real success. He stands ready to explain, to the best of his ability, details of the several plans of federation that have been thus far proposed. And above all, he urges this Association to see that it is represented by its strongest members at the meeting of the House of Delegates of the A. Ph. A. in Chicago when the federation idea is to be discussed from all angles.

THE ACID TEST.*

BY J. W. STURMER.

In these trying days the motives of men, their aims, their capabilities—and their weaknesses as well—are more apparent than was the case when times and conditions were normal. For the conditions under which we now live, and work, subject us all to the severest tests. American pharmacists have never been tested as they are being tested at this time of stress. If they stand the test, the future of pharmacy will be assured. And so far they have shown up splendidly.

But there are false prophets and bad advisers. These like the poor, are with us always. Certain influences are at work to repeal or emasculate our pharmacy laws. And the argument, forsooth, is that we must adjust ourselves to war conditions. So we must, indeed. But were pharmacy laws passed for the pecuniary benefit of pharmacists, or were they passed for the protection of the public? Are the barriers to be raised or lowered in accordance with the supply of clerks—without reference to other considerations? If so, these laws are to be considered as class legislation, and would be un-American and in fact unconstitutional. If these laws were enacted for the public good—and we at least know full well that such was indeed the case—then the question is pertinent, do war conditions confer upon any man, or any group of men, license to ignore the dictates of public policy? Is human life less sacred because we are engaged in war? Now that our boys are fighting on foreign soil, are we, who have been intrusted to hold the last line of defense, to be less alert in the protection of the families of these boys in the first line trenches, just because we are becoming injured to a long casualty list? The answer may be deduced from the fact that our governments—national, state and municipal—are putting forth greater efforts than ever before in controlling epidemics, in reclaiming the physically unfit, in reducing infant mortality, in safeguarding the laborer at his work, in conserving our food and our fuel. Life must be risked in battle. For that very reason, it must be conserved at home. Under these circumstances, the duties and the obligations of pharmacists are clear, and the agitators who at this time, endeavor to weaken our pharmacy laws, will find no supporters within the ranks of the real pharmacists. It is to the lasting credit of pharmacists and pharmaceutical associations that they lead the fight for

* Read before Pennsylvania Pharmaceutical Association, 1918 meeting.

pharmacy laws, and welcome the regulations indicated by public policy. These self-same pharmacists and pharmaceutical associations will deem it their patriotic duty to maintain these regulations at any cost, and against all assailants.

To be sure, some kind of readjustment is imperative. Pharmacists are but human. They can work only so many hours. They, like other workers, need rest, out-of-door recreation, and some diversions. They should have them. They will work the better because of them. But is it not possible, in the larger stores and even in the medium-sized stores, to "departmentalize" and to conserve the professionally trained for the sale and compounding of medicines, using mere salesmen and saleswomen in the package goods departments and for the side lines? Indeed, I would say that such a plan has been in operation in many city stores and has not only proven its feasibility, but has been most profitable. Then, women should be encouraged to take up pharmacy, for which their fitness has been conclusively demonstrated. This, of course, is not so much for the relief of the present emergency as to provide for the future, as these women must be trained in a systematic and thorough manner.

And as for the pharmacist in the one-man store, he also needs his hours of recuperation. To obtain them, he can close at specified hours. But it would seem that public interest should be considered in this, and that, in place of closing all the stores of any given locality at the same time, there should be a system of rotation, so that some trained pharmacist may at all times be available.

In conclusion, permit me to point out that the condition created by the enlistment of thousands of physicians, has augmented the purely medical duties of those physicians who have remained behind to serve the civilian population—and this to such an extent, that many who in the past dispensed their own medicines, now find it practically impossible to continue such practice. This is, therefore, the great opportunity for pharmacy. It has been said, and justly so, that the medical man in the army should be relieved of all non-professional duties, and it has been proposed that the pharmacist should assume those duties. To bring this about, certain officers in high command must be converted, or legislative enactment must be had.

But in civil life, no such obstacles are in the way, and prescription writing may reasonably be expected to increase, as a result of the dearth of civilian physicians, and the added duties devolving upon each, along the lines of purely medical service. And if pharmacists in civil life succeed in reclaiming the position they once held, the pharmacists in the army will find their chances for recognition improved correspondingly. Is this, then, the time to lower the bars, and to let in incompetents? The war has developed a keener realization of the duties of citizenship. Every good citizen must render service. So must every profession. And to pharmacy comes, with the opportunity for service, the greatest opportunity for professional advancement which has presented itself within the memory of men now active. Under these war conditions, pharmacy cannot remain stationary; it must either rise or decline. The crisis is here. Hence I say that pharmacy is now being subjected to the acid test. We shall soon know its "metal." And I for one feel assured that it will prove to be royal metal—that pharmacy will meet the test.

SO-CALLED SYRIAN ALKANET, *MACROTOMIA CEPHALOTES*, D. C.*

BY CLARE OLIN EWING AND JOSEPH F. CLEVINGER.

A sample of "Alkanet," recently submitted for our examination, proved to be, not the root of true Alkanet (*Alkanna tinctoria* Tausch), but that of so-called Syrian Alkanet (*Macrotomia cephalotes*, D. C.). Both the plants named belong to the *Boraginaceae*, and are indigenous to Asia Minor and southeastern Europe.

Previous investigators have observed alkannin-like tinctorial principles in other members of the Borage family. Vogtherr¹ has noted several foreign pigment-bearing species of *Boraginaceae*, and has discussed *Macrotomia cephalotes* in some detail. His description of "Syrian Alkanet" is accurate, although his accompanying sketch shows a root somewhat larger than any which we have observed. From *Macrotomia* he extracted 9.13 percent of a crude coloring matter which "seemed to be identical with that of Alkanet." His paper does not indicate the solvents or methods used in extraction. Coloring matters have also been noted by Norton² in a number of American *Boraginaceae*. While this investigator made no analysis of the tinctorial principles of his material, by testing with resins and oils he obtained an alkannin-like reaction from the leaves and roots of *Plagio-bolthrys*, and suggested the possible utilization of some of these plants.

The submitted sample (Fig. 1) was easily distinguishable from true alkanet root. It was very much larger in size; it occurs in pieces from 20 to 40 cm. long and 2 to 5 cm. thick, whereas alkanet is about 1 to 1.5 cm. in diameter and is usually 10 to 15 cm. long, although it sometimes occurs in pieces up to 25 cm. in length. The sample also was many headed, in contradistinction to the one or few heads of alkanet. It was black-violet in color and somewhat metallic in appearance, whereas alkanet is of a dull maroon color. Alkanet is only slightly twisted, while the "Syrian Alkanet" had a distinctly spiral twist, resembling a twist of tobacco. Vogtherr's figures shows a specimen with a much shorter spiral than any which we have observed. A section of alkanet shows that the wood is centrally placed and is surrounded by a tissue of loose, almost spongy texture. In the sample of "Syrian Alkanet" the wood, which was straw-yellow in color, was laterally placed and was accompanied by a layered coffee-brown-gray tissue on the inside, and a blackish violet color on the outside.

* Contribution from Pharmacognosy Laboratory, Bureau of Chemistry, Department of Agriculture, Washington, D. C.

¹ Vogtherr, "Über Alkanna und ihre Verwaudten," *Pharm. Centralh.*, 37, 148-52 (1896).

² Norton, "The Coloring Matter Found in Some *Boraginaceae*," *Amer. Journ. Pharm.*, 70, 346-8 (1898).

Samples of both products were ground to a No. 20 powder and the coloring matter completely extracted from 10-gramme samples with chloroform in a Soxhlet extractor, the extract evaporated on the steam bath and dried at 100° C. It amounted, in the case of true alkanet to slightly over 5 percent; in the "Syrian Alkanet" it amounted to about 9 percent. The colored extract, crude alkannin from alkanet is generally reported as varying from about 4 to 6 percent, depending somewhat on the solvent used. As mentioned above, Vogtherr reports 9.13 percent of extract for a sample of "Syrian Alkanet," but does not indicate the nature of the solvent.

Both extracts were dark brownish red, metallic glistening masses, the Syrian Alkanet being a trifle darker. They softened under 100° C. (steam bath) without having a definite melting point. This was due, no doubt, to the wax which, according to Liebermann and Römer³ is, after alkannin, the principal constituent of the extract. They isolated this wax from commercial crude alkannin and found it to be hydrocarbon melting at 75° C.

The alcoholic solution of both extracts varied from cerise to a dark red, depending upon the concentration. The colors apparently were very nearly identical, that from Syrian alkanet being perhaps of a more purplish shade. Colorimetric comparison of solutions of the two extracts of similar concentration showed that the proportions of coloring matter in both were approximately the same.

Gawalowski¹ has stated that the coloring matter of alkanet is not a single chemical individual, but contains two coloring constituents. The first, which is extracted with petroleum ether, he called anchusic acid (anchusa red), and ascribed to it the probable formula $C_{30}H_{39}O_7$; the second, which he extracted with ether and alcohol, he called alkannic acid (alkanna red) and ascribed to it the probable formula $C_{15}H_{14}O_4$ (or $C_{30}H_{28}O_8$). In view of this statement, fractional extraction was made of both products, with the following results:

| | Alkanet. | "Syrian Alkanet." |
|-------------------------|--------------|-------------------|
| Petroleum ether extract | 3.36 percent | 4.69 percent |
| Ether | 1.22 percent | 3.64 percent |
| Chloroform | 0.61 percent | 0.66 percent |
| | trace | trace |
| | 5.19 percent | 8.99 percent |

Both of the petroleum ether extracts were bright red in color, dark red in thicker layers. The ethereal extracts were of a purplish black color and were insoluble in petroleum ether. Both had an odor of acetic and butyric acids, similar to that which we have noted in a commercial specimen of crude alkannin. The chloroform extracts were also of a purplish black color and were insoluble in ether and petroleum ether. The alcoholic solutions of the petroleum ether extracts were of an intense bright red color. The alcoholic solutions of the ether and chloroform extracts were of a less intense purplish red color than those of

² "Über Alkannin," *Ber.*, 20, 2431 (1887).

³ Gawalowski, A., "Die Pigmente der 'Radix Anchusa tinctoria' in ihrer Bedeutung für die alkalimetrische und acidimetrische Analyse," *Zeit. anal. Chem.*, 42, 108-9 (1913).

petroleum ether, the difference in intensity and shade being more pronounced in the higher dilutions. The large amount of the ether and chloroform extracts in the Syrian Alkanet explains the purplish tint of the preliminary chloroform extract noted above. The color tests, which are tabulated below, show that the material extracted by petroleum ether differed chemically from those extracted by ether and by chloroform. Although the two latter were obtained separately, their reactions with the various reagents used were similar and they are therefore not listed separately.

COLOR REACTIONS OF ALKANET AND SYRIAN ALKANET.

| | Alkanet. | | "Syrian Alkanet." | |
|------------------------------|---------------------------------------------------|---------------------------------------------|---------------------------------------------------|---------------------------------|
| | Petroleum ether. | Ether and chloroform extract. | Petroleum ether extract. | Ether and chloroform extracts. |
| Basic lead acetate.. | Deep purple color and precipitate | Bluish gray color and turbidity | Deep purple color and precipitate | Bluish gray color and turbidity |
| Uranium acetate.. | Bluish gray color | Dirty green color | Bluish gray color | Dirty green color |
| Ammonium hydrosulphide..... | Indigo-blue color; purplish shade | Violet color | Indigo-blue color; less purplish | Violet color |
| Potassium hydrosulphide..... | Indigo-blue color | Light blue color; faint suggestion of green | Indigo-blue color | Light greenish blue color |
| Stannous chloride. | Cherry-red color; yellow after addition of HCl | Paler color than P. E. extract | Cherry-red color; yellow after addition of HCl | Paler color than P. E. extract |
| Ferric chloride..... | Dark violet color and turbidity | Dirty greenish brown color | Dark violet color and turbidity | Dirty greenish brown color |
| Mercuric chloride.. | Bright cherry-red color; purplish red precipitate | Pink color | Bright cherry-red color; purplish red precipitate | Pink color |

In addition to the above reactions, the color of all three extracts of both the alkanet and the "Syrian Alkanet" was destroyed when a few drops of a saturated solution of bromine water were added to a dilute alcoholic solution; the color was restored by the subsequent addition of several drops of 3 percent hydrazine sulphate solution. This reaction is considered by Mathewson⁵ to be quite specific for alkanet.

An extract of "Syrian Alkanet," prepared with 95 percent alcohol, diluted with water to 50 percent concentration of alcohol, gave very satisfactory results in this laboratory and in the Microbiological Laboratory of this Bureau in the staining for microscopic observation of sections containing fats (soy beans, castor beans, yellow mustard seed, etc.) and resins (podyphyllum rhizome and white bryony root).

The specimen of "Syrian Alkanet" was clean and free from dirt and other foreign materials. The genuine alkanet, while apparently quite clean, upon close inspection showed the presence of minute particles of sand, which adhered very tenaciously to it. We have observed this condition in a number of other commercial specimens of alkanet. Ash and ash-insoluble determinations on two-gramme portions of the No. 20 powder gave the following results:

⁵ Mathewson, W. E., "Separation and Identification of Food-Coloring Substances," Department of Agriculture, *Bull.* 54, 448 (1917).

| | Alkanet. | "Syrian Alkanet." |
|----------------------------------------------|--------------|-------------------|
| Total ash..... | 17.0 percent | 11.7 percent |
| Acid-insoluble ash..... | 8.0 percent | 0.8 percent |
| The ash in both cases was high in carbonates | | |

From the above data it may be seen that the coloring extracts from both plants consist of at least two chemical individuals and that both extracts are very similar in nature. In view of the fact that in Syrian Alkanet the coloring extract was present in much larger amount than in the true alkanet, and possessed equivalent tinctorial strength, it would appear to be a valuable substitute for the latter.

THE ESTIMATION OF ALCOHOL.*

BY C. R. HARER.

While the estimation of alcohol in pharmaceutical preparations is not very complicated, nevertheless, presents many difficulties and affords opportunities for experiment and research.

Frothing, in numerous cases, is readily controlled by tannic acid; while in particular instances sulphuric or phosphoric acid, as advised by some writers may be preferable, I find tannic acid more generally practical, although the variation of its action with different drugs has not been determined. After the addition of tannic acid to fluidextracts of gelsemium, helonias and several other drugs, they must be heated very rapidly to boiling to control the frothing. The addition of tannic acid to fluidextracts of black haw, mango bark and several others increases the frothing instead of retarding it. The addition of tannic acid to preparations of cinchona produces an uncontrollable frothing when heated, while if heated slowly without tannic acid, the liquid will froth at first, but the foam will soon subside and regular boiling take place; the initial frothing may be almost instantly eliminated if the liquid is heated rapidly in such a way that the flame is thrown on the upper part of the distilling flask for a few seconds, when the liquid starts to boil.

The estimation of alcohol in fluidextract of sarsaparilla presents greater difficulties than many other preparations, and the following experiments were undertaken for the purpose of finding a convenient and rapid method for its determination: Mechanical methods (paraffin, fixed oils, etc.) to control the frothing were tried, but without success. Baryta water was then used to precipitate the saponins and resins, but this gave no satisfactory results. Several experiments were made by adding a suspension of aluminum hydroxide to the fluidextracts also by adding an aluminum salt to the fluidextract and subsequently precipitating the hydroxide with a caustic alkali. These experiments were failures. Next an addition of the official solution of lead subacetate was tried, but I found that a direct distillation of fluidextract of sarsaparilla with lead subacetate solution was impracticable because frothing was unavoidable and it was impossible to separate the aqueous alcoholic liquid quantitatively from the voluminous gelatinous precipitate by fil-

* Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

tration; however, the following method yielded satisfactory results: Fifty mls of the fluidextract was transferred to a 100-ml cylinder, 15 mls of solution of lead subacetate was added, and sufficient water to make 100 mls. The mixture was thoroughly shaken and 50 mls, equivalent to 25 mls of fluidextract, was filtered off. This was transferred to a distilling flask, sodium bicarbonate was added to an alkaline reaction, followed by a slight excess of tannic acid. Generally traces of acetic acid are present in the distillate, but in such small quantities as not to influence the results.

In order to ascertain whether or not the method gave accurate results, the following experiments were made: 200 mls of the fluidextract of sarsaparilla was evaporated to a syrupy consistency; this residue to which 50 mls of water was added twice, which each time was evaporated, was taken up in water and transferred to a 200-ml flask; 90 mls of 94% alcohol was added and enough water to make 200 mls. Two distillations were made with this dilution and 41.5 percent and 41.2 percent of alcohol was found. At the same time a volume of water approximately equal to that of aqueous solution of the residue was placed into a 200-ml flask, 90 mls of 94% alcohol was added and sufficient water to make 200 mls. The sp. gr. of this aqueous-alcoholic mixture showed that the liquid contained 42.3 percent of alcohol. When 25 mls of this aqueous-alcoholic solution, to which 50 mls of water and 3 mls of solution of lead subacetate had been added, followed by sodium bicarbonate to an alkaline reaction and then tannic acid to an acid reaction, was distilled, 41.3 percent and 41.4 percent of alcohol was found. In the latter distillation approximately the same conditions are given as in the distillation of the liquid which is obtained by treating the fluidextract of sarsaparilla with lead subacetate solution and filtering.

The estimation of alcohol in preparations containing volatile substances presents another interesting part of this kind of work. Volatile alkali can easily be eliminated by adding tannic acid or other suitable acids, preferably phosphoric acid, while volatile acids can be taken care of by adding a fixed alkali; substances, however, like camphor, volatile oils and chloroform can be removed only by special processes.

The U. S. P. directs that the sample containing volatile substances be distilled in the usual way, the distillate transferred to a separator and saturated with sodium chloride; 15 mls of petroleum ether are then added, the mixture is thoroughly shaken and allowed to separate. The salt solution containing the alcohol is then drawn into another separator and washed once with petroleum ether. The combined ethereal solutions are washed once with 10 mls of a saturated solution of sodium chloride, which is added to the aqueous solution. The combined aqueous liquids are then distilled and the alcohol estimated in the usual way.

For liquids containing chloroform, the U. S. P. method gives satisfactory results, as the following experiments show:

Sample No. 1.—Seven mls of chloroform was transferred to a 200-ml flask and sufficient diluted alcohol (about 45 percent) was added to make a total volume of 200 mls. Three determinations of alcohol of this sample by the U. S. P. process gave 44.43.65 and 44 percent.

Sample No. 2.—Seven mls of water was transferred to another 200-ml flask and enough of the above hydro-alcoholic solution was added to obtain 200 mls. The sp. gr. of this sample indicated 45.55 percent of alcohol, while the determination of the alcohol by distillation gave 44.5 and 44.83 percent of alcohol.

While there is quite a difference of opinion as to the best method of estimating alcohol in liquids containing volatile oils, the U. S. P. method as previously stated and the N. F. IV process, which directs distilling the liquids, shaking the distillate with magnesium carbonate and filtering, are generally used. Very good results can be obtained in preparations containing a mixture of volatile oil and alcohol, or oils, alcohol and water without other extractive matter, such as spirit peppermint, spirit myrica, by eliminating the oil first, then distilling and taking the gravity of the distillate as the following experiments show; for these experiments a concentrated fluid of bay laurel was made containing about 20 percent of the combined oils pimento, myrica, and orange and 66.15 percent of absolute alcohol.

Experiment No. 1.—Twenty-five mls of the fluid was transferred to a separator containing 20 mls of saturated solution of sodium chloride and 20 mls of petroleum ether was added. The separator, containing the mixture, was thoroughly shaken and the liquids allowed to separate. The alcoholic liquid together with the salt which had separated from the solution when the fluid was added, was drawn into another separator and washed with a second portion of petroleum ether. It was then transferred to a distilling flask. The combined petroleum ether was washed with 10 mls of a saturated salt solution which was also transferred to a distilling flask and the combined aqueous-alcoholic liquids were distilled. The sp. gr. of the distillate indicated the presence of 56.9 percent alcohol, while a check experiment indicated 57.2 percent.

Experiment No. 2.—This experiment differs from the preceding only in that when the fluid was added to the 20 mls of salt solution, enough water was added to redissolve the salt which had separated. By this method 62.1 and 62 percent of alcohol was obtained. This seems to indicate that in the presence of excess of salt, some alcohol is carried mechanically into the petroleum ether with the oils.

Experiment No. 3.—Twenty-five mls of the fluid was transferred to a separator and saturated with sodium chloride and after the addition of 20 mls of petroleum ether the mixture was shaken. When the liquids had separated, the aqueous-alcoholic layer was drawn into another separator and washed with another portion of petroleum ether; the combined ethereal liquids were washed with 10 mls of saturated salt solution, which was added to first solution. The combined aqueous-alcoholic liquids were then distilled and the distillate was found to contain 64.6 percent of alcohol, while a check experiment indicated 64.7 percent.

Experiment No. 4.—Twenty-five mls of the fluid was transferred to a separator, 20 mls of saturated salt solution was added and enough water to dissolve the salt which had separated. After the addition of 20 mls of petroleum ether, the estimation was carried out in the usual way, with the exception that after the petroleum ether had been washed with 10 mls saturated salt solution, it was washed with two portions of 10 mls each of water. By this process 65 and 65.2 percent of alcohol was obtained.

Experiment No. 5.—This experiment was made by following the exact directions of the U. S. P., 65 and 65.3 percent of alcohol was found.

Experiment No. 6.—Twenty-five mls of the fluid was transferred to a distilling flask and after the addition of 50 mls of water, the mixture was distilled. The distillate was shaken with talcum and filtered. It contained 64.9 percent of alcohol and a check experiment gave 64.7 percent of alcohol.

Experiment No. 7.—As a last process Richter's modification (*Pharm. Zeit.*, 1914, page 431) of a process originated by Thorpe and Holmes (*Jour. Chem. Soc.*, XIX, page 259) was applied. This method is very simple and gives accurate results and is carried out as follows:

Thirty mls of the fluid is mixed with 30 mls of a 15% sodium chloride solution and 30 to 40 mls of petroleum ether boiling below 60° C. is added. The mixture is shaken well in a separator and then allowed to settle; when the lower layer has become clear, it is drawn off and, if necessary, filtered with a small amount of magnesium carbonate, 50 mls of the filtrate representing 25 mls of original sample is distilled. 65.8 and 66.1 percent of alcohol was obtained by this method, which percentage agrees closely with the theoretical amount.

The results appear tabulated as follows:

| Process..... | 1. Percent. | 2. Percent. | 3. Percent. | 4. Percent. | 5 U. S. P. Percent | 6. Percent. | 7. Percent. |
|--------------|----------------|----------------|----------------|----------------|-----------------------|----------------|----------------|
| 1st..... | 56.9 | 62.1 | 64.6 | 65.2 | 65.3 | 64.9 | 65.8 |
| 2nd..... | 57.2 | 62.0 | 64.7 | 65.0 | 65.0 | 64.7 | 66.1 |

The tabulation indicates that process VII yields the best results, while the U. S. P. and process IV yield very nearly the theoretical amount of the process alcohol present.

LABORATORIES OF SHARPE & DOHME.

THE REACTIONS OF GOLDFISH TO CERTAIN HABIT-FORMING DRUGS—THE USE OF THE GRADIENT TANK.

BY VICTOR E. SHELFORD.

The problem of the cause of the development of the drug habit, *i. e.*, of the peculiar effects of habit-forming drugs which cause the user to crave them, has been approached from several different angles, but none of them have afforded a solution. Attention appears to have been directed especially toward morphine and related compounds.¹ The theory that morphine causes the formation of oxymorphine, which produces an effect the opposite of morphine, has been exploded by the discovery that oxymorphine is not formed and that its effects are not the opposite of morphine. The idea that immunity is developed is rejected because of the fact that such immunity does not exist in animals which are habituated by the use of morphine. The increased capacity of the organism to destroy morphine is not an adequate explanation as morphine is very slowly destroyed.

Most of the work has been done on mammals, some on frogs, but I find almost nothing in the literature that shows the development of anything like a craving, taste, or preference for the substance in question, on the part of the lower vertebrates. In fact it is not easy to show that these animals are so affected. By chance the writer discovered that fishes are peculiarly affected by numerous organic substances in aqueous solution, when put under special experimental conditions. These conditions are established in a long, narrow tank, 122 cm. long, 15 cm. wide and 13 cm. deep (see Fig. 1-A), in which water containing a drug flows into one end and out at both top and bottom, at the middle, while water which contains none of the drug flows into the other end at the same rate. The two flows meet at the middle and with most substances there is a mixture of the two kinds of water which occupies the center third of the tank. In this mixture a fish moving from the pure water end toward the drug-containing end encounters a gradual rise in concentration of the drug. This region of change of concentration is called the gradient. The character of the gradient in these tanks has been fully determined, by taking samples, by measuring conductivity, and by the use of colored water. Usually a sample which contains none of the salt or any amount from the faintest traces up to the full concentration introduced, may be withdrawn (Fig. 1-B). Some substances diffuse almost through-

¹ Sollman Manual of Pharmacology, 1917.

out the tank, so that the gradient, or region in which there is a rise in concentration extending from near the pure water end toward the end in which the drug is introduced, reaches almost the entire length of the tank.

GRADIENT TANK (A). LONGITUDINAL SECTION OF TANK (B).

Figure 1-A:—The gradient tank and apparatus for introducing drugs into one end. The water flows into the two ends of the tank from a common source. The flow is adjusted with a pinch cock on a rubber hose at the right-hand end, for example, at 500 Cc. per minute. This is done by turning the 3-way valve so as to run the water outside of the tank through the small spout which ends at the water level just outside of the tank. The water can be caught here in a graduate for a definite length of time and the flow per minute determined. The flow at the end into which the drug is added may be set at, say, 400 Cc. per minute and then sufficient of the drug solution added to the mixing bottle from the siphon above at the left (100 Cc.) to make this 500 Cc. also. The solution of a non-volatile drug is siphoned (see Fig. 1-A) from dish in which is a 12-liter aspirator bottle (*a*) with the upper opening tightly corked and the lower one open. When the water in the dish falls below the level of the lower opening a few bubbles of air slip in and the same amount of fluid flows out, thus maintaining a constant level in the dish as long as the supply in the aspirator bottle holds out. Volatile substances have usually been added directly from the lower opening of the aspirator bottle. In this case it is necessary to correct the flows occasionally. The drug solution is run into a mixing bottle (*m*) which is connected in the flow of pure water.

Figure 1-B shows a longitudinal section of the tank when a substance is introduced at the left-hand end. The substance is shown by black markings. The central portion shows a gradient between pure water (white) and black lines. The graphs are drawn on the basis of the position of the fish in this longitudinal section.

In order to discuss the behavior of fishes in habit-forming substances, it is first necessary to note in detail what happens when (1) a fish encounters no change in water and (2) when it encounters water containing a quantity of carbon dioxide or other environmental substance. When the water is the same throughout fishes usually go back and forth in the tank either without turning around in

the middle or, if so, without showing any preference for either end. Graph 1 shows the usual movement of an active goldfish which went back and forth, and though it turned around in the middle third of the tank occasionally, it turned the same number of times when headed each way, even in the short 20-minute period. Graph 9 shows a control graph in which an inactive fish staid near the center. Graph 10 shows the behavior of a minnow which swam from end to end, except for stopping under the lights—a reaction quickly masked by response to another stimulus. When introduced into a tank in which the water running into one end is charged with carbon dioxide up to about 15 Cc. per liter, or more, the fishes act in a very striking and characteristic way (2). When they swim into the acid water, the fishes undoubtedly sense deleterious concentrations of CO_2 upon entering it. They give evidence for this by the following activities, as shown by an earlier set of experiments:² A definer reflex was often given by minnows (*Abramis*, *Notropis*, *Hypopsis*) and sunfishes (*Lepomis*), the first time they entered the modified water. The fish suddenly stops, backs quickly a few millimeters, and then starts ahead again, often repeating the reflex before going farther forward. In an earlier paper, this was called the backing-starting reaction. This may be due to stimulation of the nostrils, as Sheldon³ states that stimulation of the nostrils of the dogfish results in a quick jerk of the head. There is acceleration or increased vigor of movement of fins, tail, or body, which begins at once or after a very short time. Sheldon found that the application of solutions to these parts caused them to be moved. The opercles were lifted, the lower jaw protruded, or the mouth moved in a manner characterized as coughing, gulping or yawning. Sheldon found that stimulation of the mouth or spiracle gives rise to violent gulps. In our experiments these reactions occurred singly or in combination. The time necessary to produce them was variable, but depended upon the strength of the stimulus, which confirms further observations by Sheldon.

When a fish enters a deleterious solution of alcohol, cocaine, morphine, or any one of the several other substances, nothing of the kind ordinarily happens. There is no rejection of the drug containing water, no gulping or raising of the opercles. The fish swims into the water apparently without noting any change. After a few entrances it begins to turn back from the normal, pure water, or from the lower concentrations of the drug in solution just as from carbon dioxide, but usually without the gulping, or any of the other movements which follow stimulation. This was first noted in the study of the reaction of the golden shiner to ammonia in 1911.⁴ It was again observed in the study of the reactions of a number of species of fish to coal-tar products in connection with a study of the effects of stream pollutions.⁵ Fishes of various species showed a *preference for*, that is, *reacted positively to*, coal-tar products, various mixtures of them, and gas liquor. The species giving positive reactions were the large-mouthed black bass, minnows (*Notropis*, *Pimephales*, *Abramis*), rockbass, and three species of sunfish.

The substances for which the fishes showed the preference as described, and to which they are said to react positively, are the following: Ammonia and

⁴ Shelford and Allee.

⁵ Shelford, *Bull. Ill. St. Lab. of N. H.*, 11, 383-411.

several of its salts, aniline, pyridine, isoquinoline, sulphur dioxide, carbon disulphide, thiophene, acetone, phenol, paracresol, phenanthrene, naphthalene, xylene, toluene, acetylene, illuminating gas, and waste.

CHART 1.

The graphs on this chart, numbered 1, 9, and 10, show the movements of fishes in the gradient tank when no drug has been added at the end, and the water is therefore of equal purity throughout.

The gradient tank is shown in Figure 1-A. Figure 1-B is a diagram of a longitudinal section of the tank; the left-hand end was used for the introduction of water such as the fishes had been kept in, and the right-hand end was used for the introduction of water to which the substance being tested had been added. The light vertical lines are intended to indicate the location of thirds of the tank length. The solid black area at the right between the two lines at the head of each graph is intended to show the part of the tank in which the drug solution is nearly the full strength of that flowing in, and the narrowing of this black area from right to left in the middle third is intended to indicate the region of principal gradient; X indicates that the fish became intoxicated.

Graph 1 shows the usual back and forth movement of a goldfish when not encountering any difference in the water in the two ends—a control experiment.

Graph 2, positive reaction of a goldfish to water containing 0.35 Gm. cocaine hydrochloride per liter introduced at the right. The fish turned back on encountering a slight dilution after 40 seconds, swam the entire length of the tank twice, turned back on encountering a slight dilution at the end of four and a half minutes and remained in the highest concentration of the drug until intoxication resulted.

Graph 3, the same as the preceding, but a different fish; shows a strong preference for the cocaine solution and an avoidance of the pure water.

Graph 4 shows a positive reaction of a goldfish to a 1.5 percent solution of ethyl alcohol introduced at the right-hand end. The fish turned back repeatedly from the pure water after trying out the tank during the first three minutes. A graph of the reaction to 10 percent alcohol resembled No. 3 very closely.

Graph 5, an indifferent reaction of two goldfish to 0.15 Gm. per 1 Gm. of morphine hydrochloride. Where the two fishes moved together only one line appears; where separately, one of them is indicated by a broken line.

Graph 6, a positive reaction of two goldfish to 1 Gm. per 1 Gm. of morphine hydrochloride per liter. One fish was negative to the water without morphine from the beginning; the other spent three minutes in the pure water beginning at the end of three minutes.

Graph 7 shows a positive reaction of a goldfish to water half saturated with naphthalene; Graph 8, to saturated naphthalene. In both cases the fish became positive to the naphthalene at once.

Graph 9 shows a control movement of a sluggish goldfish.

Graph 10, a control movement of a wild minnow (*Pimephales*).

Graph 11, a negative reaction of such a minnow to 1-2 percent alcohol.

Graph 12, a positive reaction after the fish had been kept for 30 minutes in a 0.5 percent solution of alcohol.

Fishes are not invariably positive to all of these, as the positive reaction is often determined by concentration, character of the dissolving water, etc., but positive reaction is the usual rule. While ether, chloroform, chloral, and paraldehyde are habit-forming in the case of man, I find no records in the general works for any of the coal-tar products noted above. Since the goldfish has been used as a test animal in drug standardization, it was thought desirable to test its reactions to two or three habit-forming drugs. Cocaine hydrochloride, morphine hydrochloride, and ethyl alcohol were chosen. The standard gradient tank with symmetrical incandescent lights and a hood were used with general results as described on p. 598. Because of the large amount of water used it has been impracticable to carry on the experiments in distilled water. They were conducted in water such as the fishes had been kept in.⁶

COCAINE.

Only a few experiments were tried with this as the fishes were positive to all concentrations tried. In 0.35 Gm. of the hydrochloride per liter the goldfishes were positive at once, *i. e.*, turned back on encountering the pure water (Graphs 3 and 4). They became intoxicated and died in the high concentration end. No reactions such as follow peripheral stimulation with CO₂ were noted. The graphs show that after two or three minutes' exposure and a few turnings they remained in the higher concentration of the drug.

ETHYL ALCOHOL.

Goldfish were positive to 1.4 percent alcohol, as shown in Graph 4. Waters with less alcohol or no alcohol were quite consistently avoided. Their reaction to 0.5 percent is usually negative. Their reaction to 1 percent alcohol was positive and remained so consistently for two hours, when some nervousness and excitability occurred which lasted for five hours more in which the fishes spent most of their time in the more dilute alcohol of the center of the tank, but avoided

⁶ For analysis and comment see Wells, *Biol. Bull.*, 29, 226-227.

the pure water. When 2 percent alcohol was used they remained clearly positive for six hours. With 3 percent alcohol they remained clearly positive for three hours, when they became nervous and slightly tipsy. At this condition they appeared not to note the difference between the two ends, but still spent most of the time in the alcohol end. Their reaction was decidedly positive to 10 percent alcohol. They occasionally moved toward the low concentration but turned back quickly on encountering a slight decrease in concentration. At the end of 20 minutes they were semi-intoxicated and the experiment was discontinued. In 20 percent alcohol they avoided the full strength but still gave a positive reaction for the short time they were under observation.

MORPHINE.

They appeared not to note 0.15 Gm. per liter of morphine hydrochloride, as shown by Graph 5, where the drug was not avoided, but no good evidence of any preference shown. In 1 Gm. per liter one fish showed a positive reaction throughout, while the other spent a little time in the pure water. Other individuals avoided the strongest morphine and pure water staying in the center of the tank and turning back from both ends.

NAPHTHALENE.

Goldfish are positive to half saturated and saturated solutions as shown in Graphs 7 and 8. It is only very slightly soluble but sufficiently so to kill fishes in an hour or more.

OTHER SPECIES.

Minnows of the genus *Pimephales* were found, in course of my experiments on pollution, to be more often negative than other species. This species was uniformly negative in reaction to alcohol up to three percent. After being kept 20 hours in $\frac{1}{4}$ percent it was negative to 1 to 2 percent, more negative than when kept in water. Fishes kept one-half hour in $\frac{1}{2}$ percent gave positive reaction to 1 to 2 percent; others kept 20 hours in $\frac{1}{2}$ percent showed a more positive reaction, showing that the preference for alcohol is developed by exposure to it, but that the fish is negative to concentrations to which the goldfish is positive.

TADPOLES.

A single experiment with a tadpole and 20 percent alcohol showed the animal positive and suggested the use of tadpoles about to transform into frogs as affording a well-known laboratory animal for such studies.

CONCLUSIONS.

These incidental preliminary observations indicate the following tentative general considerations:

a. That fishes quickly form a preference for water containing alcohol, cocaine, morphine, and certain other substances. They appear, as a rule, to avoid very weak concentrations and are in nearly all cases less positive at first. This with the habituation of minnows usually negative to alcohol by an exposure of 30 minutes in $\frac{1}{2}$ percent alcohol indicates that the sensory endings are quickly modified in their sensitivity.

b. The gradient $\tan^{-1} \frac{1}{200}$ may afford a means of studying "habit" formation and also of investigating compounds or combinations of drugs which may produce the desired therapeutic effect with least danger of creating an appetite. Results with fishes may differ from those obtained with man, but they may readily afford information which can serve to interpret results with higher forms.

RAPID GENERAL ASSAY METHOD FOR ALKALI SALTS OF ORGANIC ACIDS.

BY A. B. LYONS.

Ignition of salts of organic acids is a tedious operation, even if one is satisfied merely with thorough carbonization of the organic compound. In the official general assay process (U. S. P. IX, p. 589) this is all that is required, yet the plan of dissolving out from the carbonized residue the alkali carbonate with aid of volumetric acid and heat, filtering out the carbon and washing out all the residual acid, calls for a considerable expenditure of time and labor.

It has been suggested by E. Elvove that conversion of the salt into a *sulphate* is to be preferred to simple ignition resulting in the formation of a carbonate, and no doubt equally good results can be obtained by this procedure. There is, however, no gain in time consumed, but by a very simple modification of the process it is made far more rapid than either of the other methods, with no sacrifice of accuracy in the results.

The following is the new procedure: Weigh accurately in a small beaker about 0.5 Gm. of the salt, add 20 mils of alcohol, to which has been previously added 10 drops of strong sulphuric acid, from a pipette delivering 60 drops to the mil. Stir the mixture well and let it stand a few minutes, then decant the alcoholic solution into a platinum or quartz dish. Wash the residue in the beaker by decantation with two successive portions of alcohol (5 and 3 mils), adding the washings to the dish. Set fire to the alcohol and allow it to burn off, then ignite the residue at a temperature not exceeding dull redness. Since the residue consists almost wholly of the organic acid of the salt, together with a little free sulphuric acid, the carbon will burn off, in a very short time, the ignition requiring no attention meanwhile.

Dissolve the residue of alkali sulphate in the beaker in a little hot water, and when the carbon has been practically all burned off from the first residue, cool the dish and add to it the sulphate solution, together with rinsings from the beaker. Evaporate the solution in the dish to complete dryness and ignite at a red heat until white. Cool in a desiccator and weigh as alkali sulphate.

Since the sulphate has not been in contact with carbon to any appreciable extent during the ignition it may be considered to consist (barring impurities in the salt) wholly of alkali sulphate. However, if there is any doubt about this, the salt may be dissolved in a little hot water, a drop or two of sulphuric acid added, the solution evaporated, and the residue once more ignited.

It is assumed in these general assay processes that the salt is substantially free from impurities. The Pharmacopœia in each case provides tests which exclude most of the impurities which would affect the result of the official assay. The question arises whether in an assay based on conversion of the salts into sulphates the result will be equally guarded by the pharmacopœial purity requirements. It is evident that an impurity which increases the weight of the sulphate vitiates the result of the assay by the sulphate method, while the presence of the same impurities in the carbonate residue of the official assay does not affect the result unless they increase or diminish the alkalinity of the residue. Hence, if the sulphate method is resorted to, the question of the possible presence in the salt of fixed impurities not excluded by pharmacopœial purity requirements must be kept in mind. The impurities most likely to be present in alkali salts for the detection of which pharmacopœial tests are wanting or inadequate are sodium and potassium, and not infrequently magnesium and calcium. These impurities (not likely to be present in any large proportion) will affect the result of an assay either by the carbonate or the sulphate method, the former to a greater degree than the latter. One must bear in mind, however, the fact that where such impurities are present the result reached by the U. S. P. assay does not accurately represent "the amount of salt contained in the sample," as is assumed in the rubric of purity of the respective salts.

BACTERIOLOGY, ITS RELATION TO PHARMACY AND ALLIED SCIENCES.*

BY LOUIS GERSHENFELD.

Bacteriology is an infant of many affiliations, always displaying unusual talents and with the possibility of attaining its maturity in the near future. Forced to await the perfection of instruments of magnification, it remained for the Jesuit Kircher, and the Dutch linen draper, Leeuwenhoek, in 1675, to pave the way for the birth of this science. Though the latter, as well as other pioneers of the seventeenth century, had foreseen the parasitic theory, many authors denied it while others admitted it only as a daring supposition, inasmuch as a positive proof supporting such doctrine was always wanting. Agostino Bassi, a Lodigian physician (born in 1773), may be proclaimed as the true founder of the doctrine of pathogenic microbes. The works published by Bassi in 1835 are sufficient proof to convince anyone that he was a precursor of Pasteur and Koch, as well as the founder of the entire doctrine. His work does not fail to make a profound impression, but this ably formulated doctrine entered but slowly into the domain of science, until 1850, when Dove, together with Rayer, demonstrated a specific pathogenic microbe as the direct agent of a general infective disease (anthrax).

Numerous investigations were begun and due to the excessive enthusiasm in the acceptance of the parasitic doctrine, the insufficiency of the methods of research were frequently supplied with the imagination of the experimenters. Due to this fact, the edifice, so ably raised, quickly crumbled under the blows of the stringent criticisms of different investigators, and everything thus far formed as an aid, together with the doctrine itself, fell into discredit. It is not my intention in this theme to repeat the history of this long conflict (for a complete account is described in Loeffler's work on "The Development of Bacteriological Doctrine").

Bassi's fundamental ideas, more fully developed by Pasteur with his different studies, were not accepted, however, until after the publication of Koch's researches on infective diseases, in 1878. The latter's work was made possible due to the improvement of technique that was made available, after the introduction of the microscope with immersion objectives (invented by Amici and improved by Stephenson), and the discovery of the use of aniline dyes by Weigert in 1875.

Thus, briefly stated, is what took place before science began to satisfy one of its supreme aspirations, *The Knowledge of Causes*, and yet have within its realm one of the greatest of branches that interests both mankind and the universe. Thus brought forth by man's eager and active desire to *know*, bacteriology was soon put into service to help and to save. The problems encountered were touched by botanists, physicians, chemists, pathologists, physiologists, physicists and pharmacists; and their solution soon shed light upon biological principles of the broadest application. Pathology, especially experimental pathology, was re-created and physiology was soon linked with it. New life was given to zoology and botany received additional inspiration. By the methods used in studying the pathogenic bacteria, contagion was made apparent and modern hygiene (personal as well as industrial), public health sanitation and preventive medicine

* Read before Philadelphia Branch, A. Ph. A., May 20, 1918.

thus became established. Who knows if surgery would have ever developed would not bacteriology have supplied its chapter of antiseptics? And apart from the sciences, I doubt if there is a field of human activity that is not already calling upon bacteriology to assist it in its progress. Agricultural pursuits and industries, too numerous to mention here, have and are extending their hands to receive it.

The scope of bacteriology, as one may thus see, is a wide one, with numerous fields and avenues before it, as yet undeveloped. All this time this branch of science has been held under sway by those closely allied members of science that claim to be her *Pater*, though in reality, bacteriology has been produced because of the necessity of the finding of a brother to keep the brotherhood of science intact.

With a definite purpose, the teaching of bacteriology has come in a comparatively brief time to play a very important part in the scientific education of all; and bacteriology is being taught now in most all of the educational institutions. But is the bacteriologist usually thoroughly trained? Has he a broad foundation upon which to erect a sound superstructure? Can a finished product be evolved from a knowledge of bacteriology which has been acquired in the short period of six or eight weeks of a regular college course? and still fit one to handle this vast subject as it is applied to domestic science, agriculture, botany, dairying, water and sewage purification chemistry, pharmacy, medicine, dentistry, veterinary medicine, public hygiene and sanitation, pathology, industrial hygiene, the industries at large, etc. The range of activity and influence of this subject is indeed large and I contend that it is impossible to confine it to the usual curriculum of the medical school only. As a science, bacteriology, though borrowing and giving to other fields of study, possess its own technique and its own methods of investigation and experimentation; and I think the time is close at hand when we will see this field subdivided into its different avenues, as has been found necessary when dealing with chemistry and other sciences. The future of bacteriology is rich in allurements of interest, in promise of results and in a greater possible benefit of mankind.

What would bacteriology be to-day had there been no Pasteur, the chemist? What would bacteriology do to-day without Dakin, the chemist? Yes, and what would bacteriology, as a whole, amount to without its assistance of that closely related science, chemistry? And still it is a known fact that few bacteriologists are not even familiar with the elementary principles of chemistry, which is not only an adjunct but essential to every student in bacteriology, so as to have a correct understanding of what is before him.

This is in addition to the broader and greater problems before us which may be classified under biochemistry and animal or plant physiology, where extensive training in both bacteriology and chemistry is an absolute necessity.

With the realization of what is before her, bacteriology is just beginning to emerge from her peculiar state of disorder and it is time for pharmacy, as a science among other sciences, to quickly realize her own chaotic position and take advantage of what is before her and what bacteriology has to offer. Not since the days of Pasteur (when numerous pharmacists were coöperating with him in his field

of endeavors) was there a more appropriate time for the professionalizing of pharmacy than there is at present during prevailing conditions.

The average graduate from a reputable pharmacy school (especially if the student was a high school graduate) has had a sufficient preliminary training in inorganic, organic, and analytical chemistry, preliminary bacteriology and hygiene, and allied subjects to be able to take advanced post-graduate study (at least one year) in chemistry, bacteriology and advanced pharmacy, to quite readily assume the responsibilities and master the situations that will confront him in a professional pharmacy, where the many-sided problems should be more of a scientific and of a professional character, rather than commercial, if pharmacy is to still keep its roll among the sciences. Students thus trained to deal with medical bacteriology, perform the commonly applied clinical tests and further apply their knowledge in quest of scientific research, will greatly benefit themselves financially, socially and otherwise; and they will raise pharmacy to that high professional standard that it should and I hope will possess.

Let us all remain alert and take advantage of that which bacteriology has to offer us and which pharmacy can well handle. Let us approach it with the right spirit and with this most fertile field for study and investigation let us try to bring pharmacy back to where we all (I am sure) would like to see it and where it rightfully belongs.

DEPARTMENT OF BACTERIOLOGY AND HYGIENE,
PHILADELPHIA COLLEGE OF PHARMACY.

THE USE OF SACCHARIN AS A SUGAR SUBSTITUTE.*

BY SAMUEL T. HENSEL.

The United States Government having restricted the use of sugar employed by the druggist to the extent of 20 percent of his requirements, we are confronted with the problem of meeting this restriction in the most practical way.

Various substitutes for sugar have been recently suggested, some of them absurd, and all of them of doubtful utility.

In my opinion, the very best way to conform to this regulation is to make up the 20 percent reduction in sweetening power entailed by governmental requirement, by the employment of an equivalent amount of saccharin carefully calculated with respect to its sweetening power, and mathematically correct.

Such a method I am prepared to suggest, and herewith present the same in detail.

In view of the present status of saccharin, it would of course be necessary to secure permission from the United States Food Administration, basing our plea for the necessity of its use as a temporary recourse, to be employed for the period of the war only.

I am of the opinion further, that much of the prejudice against saccharin heretofore existing, has been the result of unsupported statements which have been made against the use of that substance.

* Read before Denver Branch, A. Ph. A., May meeting, 1917.

According to the *London Lancet*, there is evidence that saccharin does not appear to produce harm to the human organism, and that since the compilation of that evidence last September, there is still no ground for thinking that it is in any way harmful.

My plan is very simple, entails no additional expense to the druggist, and will solve the problem completely, preserving an important department of our business from disaster and at the same time sustain us in our efforts to serve the public with a pure and wholesome product.

As you all know, 100 pounds of granulated sugar or crystal A, when subjected to percolation, will yield 13.7 gallons of syrup having a density or specific gravity of 1.320 representing 65.5 percent of sugar. Now since $\frac{100}{13.7} = \frac{80}{x}$ we find the value of x to be 10.9 gallons, therefore, $13.7 - 10.9 = 2.8$, the amount of water to be added to the percolate of 80 pounds of sugar.

The employment of the following solution of saccharin will provide the equivalent of the sweetening power of the 20 percent reduction required by the Government:

| | |
|--------------------------|-------------------|
| Take | |
| Saccharin .. | 235 grains |
| Sodium bicarbonate .. | 117 5 grains |
| Alcohol .. | 1 1/2 fluidounces |
| Water sufficient to make | 2 8 gallons |

The above solution¹ when added to 10.9 gallons of concentrated syrup, will make the same volume of syrup as that obtained by the percolation of 100 pounds of sugar, its specific gravity will be less than the former, but its density will be nevertheless sufficient to assure its freedom from fermentation, and consequently its quality as a preservative of many of the delicate fruit flavors.

A syrup of this composition will represent a 1 : 4000 solution or approximately 1/10 of a grain of saccharin in the fluidounce of syrup, an amount so small as to be negligible when compared with the medicinal dose of that substance, which is from one to five grains.

The above combination will represent the sweetening power of 100 pounds of sugar, when saccharin of the highest purity is employed.

When saccharin was first introduced, it had a reputed sweetening power of from 250 to 300 times that of sugar, it was also known that the then commercial quality consisted of from 40 to 60 percent of an inert or nonsweetening substance. Since then, saccharin of the highest purity has been obtained possessing a sweetening power of from 550 to 600 times that of sugar, and it is to this product that I refer.

Before I close, I would like to say that the saccharin used in this way is not intended to replace the food value of the sugar displaced, and that should the

¹ Editor's note—Mr. Hensel makes the statement, "That the density of the syrup will be sufficient to assure its freedom from fermentation." As the addition of the saccharin solution is a simple dilution, it is not necessary to reduce a large volume of syrup for stock until individual experiments have proven satisfactory. In some states the use of saccharin is not permitted in soda fountain syrups, though probably, under present conditions, permission would be granted by the State Food Departments. Since this was written further restrictive orders have been issued.

United States Food Administration at any time in the future deem it advisable to further restrict the supply of sugar, the proposed method will serve as the basis of a sliding scale, which can be readily adjusted from time to time.

Great Britain, according to the *Lancet*, has taken control of the entire output of British saccharin which is to be distributed under supervision of the British Food Administration, having in mind its sweetening power; therefore its availability to displace the sugar employed by the British public in the use of tea and coffee, and with no reference to its food value.

INVERSION OF SUGAR IN U. S. P. SYRUP.*

BY G. W. LLOYD PLETTE.

Observing that certain concentrated sugar solutions developed more or less invert sugar after standing for a time, when at first they contained none of the single sugar or at least a mere trace, the question arose as to the cause of the inversion of the sugar: whether it was due to the action of molds or bacteria, or whether conditions of storing with reference to light and temperature might have been responsible for the change.

Simple Syrup, or the *Syrupus* of the U. S. P. IX, is a 64.7 percent by weight solution of sugar in water. It seems that the best quality of cane sugar—"Crystal A"—is preferred for the manufacture of this syrup.

In the investigation of this question, samples of syrup were made up by both methods mentioned in the U. S. P., *viz*: the "hot" and "cold" methods, and stored under as large a number of different heat and light conditions as possible. The samples were prepared on the 10th of February, this year (1917), and were analyzed for glucose at regular intervals until June the 9th, the volumetric estimation of glucose with Fehling's solution being the method employed. The following results were obtained:

The first sample, made by the cold method and stored in a warm, dark place, showed 45.5 percent glucose after the four months.

The second, made by the cold method and stored in medium light and changeable temperature (almost exact drug store conditions), showed 25.5 percent glucose.

The third, made by the cold method and stored in a cold, dark place, showed only 10.7 percent glucose.

The fourth sample was lost.

The fifth, made by the "hot" method and stored in a cold, dark place, showed only 8.93 percent glucose.

The sixth, made by the hot method and stored in a warm, light place, showed 11.1 percent glucose.

The seventh, made by the hot method and stored in a dark, warm place, showed 16.67 percent glucose.

The eighth, made by the hot method and stored in a cold, light place, showed 15.15 percent glucose.

*Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

The samples were stored in 4-oz. bottles and were shaken daily, in order to prevent a dilution of the top of the liquid, which would serve as a good medium for the growth of any kind of bacterial or mold contamination.

The first observation worth noting is that the syrup, made by either hot or cold method, seemed to be freer of glucose when stored in a cold, dark place.

In spite of the fact that the bottles were shaken daily, all of them developed a fungus growth after a few weeks, and this continued to develop regardless of the high concentration of the syrup. The first bottle gave off a slight alcoholic odor, and the cork "popped" when drawn, suggesting CO₂. The second showed CO₂, but the alcohol was not noticeable. Neither of these were noted in the others, all of which contained a lesser amount of glucose than the first two.

When cultures were made of the different syrups both on agar and gelatin, the latter showed practically no growth, but the agar showed much gas formation and a strong alcoholic odor, signifying the presence of yeast, which was later verified by the microscope. The gas formed under the agar in both aerobic and anaerobic cultures, and was sufficient in each case to raise the agar up in large lumps. The anaerobic culture showed some short, thick rods when stained with methyl violet. These seem to have been a contamination of some kind, as there were very few and there was no fetid odor characteristic of most bacterial growth.

In addition to the yeast cells there was a mold, which proved to be *Penicillium glaucum*. It seems that the mold was almost, if not entirely, responsible for the inversion, as the mold was most abundant in the samples which showed the largest amount of glucose, and these bottles were also the ones which were stored under conditions most favorable to the growth of the fungus, both as to light and temperature.

Therefore it would appear that the best conditions for the storage of syrup are as follows:

The syrup should be stored in full bottles in a cold, dark place, and shaken daily or perhaps twice in a day, in order to preserve the highest degree of concentration and thus keep a thoroughly sterile preparation. There is probably no advantage as far as inversion prevention is concerned in either the hot or cold method of preparing the syrup.

WANTED—THE OLD-FASHIONED PHARMACIST.*

BY J. W. ENGLAND.

Under the caption of "Wanted—The Old-Fashioned Doctor," the following editorial has recently appeared in the Philadelphia *Public Ledger*:

"As the shortage of doctors continues to make itself manifest in civilian life, it is being made clear to the most thoughtless that what the medical schools should turn out in greater numbers and what the country needs is the good, old-fashioned, all-round general practitioner. In many ways the tendency of medical education of recent years toward concentration in the matter of schools and extreme specialization and standardization has not only reduced the number of doctors as a whole, but seriously cut down those who cared for or were trained for general

*Read at meeting of Pennsylvania Pharmaceutical Association, June 1918.

practice. It is now seen that this practice was not altogether the wisest of courses. The highest of standards for admission to medical schools, it may be said, should be maintained in these days of advanced sanitation and advanced methods of preventive medicine; but with these high standards, which have had the effect of cutting down the supply of students, and therefore of doctors, it would seem as if something should have been done before the war to increase the attractiveness of the medical profession, and, what is more, instead of forcing the issue as to specialists, give the general practitioner a dignity and opportunity which for a number of years have been denied him.

"As a consequence, the depletion of the specialists, not only the surgical specialists, by the war, has left the medical profession available in civil life scant in numbers and with altogether too few who are indisputably general practitioners and truly understand the 'art of healing.' For healing is an art, and it depends more largely than many think on individual equation plus the science of medicine as it is obtained in the schools, the hospitals and the daily practice. * * *

As it is, if the war continues, the great need of utilizing the general practitioner for all sorts of service from which he is now cut off by the detailed specialization which rules will be pressed home on every one.

"The medical educators, however, naturally are not blind to the situation and to some of them what is happening will be viewed as a case of 'I told you so.' At all events, as all schools and colleges are looking to their methods with a view of determining their practical relation to the output, it would seem as if the medical schools are in need of some genius who will plan for them a system which will turn out more old-fashioned doctors and leave the necessary specialization to be carried on by relatively small groups of laboratory workers, while the doctors serve the community as a whole and along broad and general lines, applying the hospital and laboratory facts by the bedside, in the home and in the office as occasion calls for."

The shortage of the "good, old-fashioned, all-round general practitioner" is not only quantitative, by reason of fewer medical schools and fewer students, but qualitative, also, by reason of the extreme standardization of the medical sciences and art taught in the schools and the overspecialization of medical practice.

The practice of medicine to-day is in a state of evolution. The older practitioner has a firm faith in the use of drugs for the treatment of disease. The newer practitioner has little faith in drugs and much concerning preventive medicine.

The scientific exactness of the sciences applied in preventive medicine—bacteriology, immunology, hygiene, sanitation, etc., and the brilliant results they have yielded in conserving human life, have appealed powerfully to the imagination of the medical profession, especially when contrasted with the apparent lack of scientific precision in the use of drugs, which lack, by the way, is more apparent than real.

Many of the medical schools unduly emphasize the importance of preventive medicine and minimize the importance of *materia medica* and therapeutics, so that therapeutic nihilism has grown apace and drugs are being used, less and less, by the younger men, at least, in the treatment of disease, although, it is but fair to add that some of the most prominent schools and teachers of the day recognize the value of drugs and are staunch advocates of their use.

The indirect result of this trend, however, has been that there is less and less demand by physicians of pharmacists for professional services; and yet many

physicians condemn pharmacists for the too largely non-professional character of pharmacy. If the practice of pharmacy in the retail drug store of to-day is not as professional as it should be, the fault is chiefly with the medical profession, by reason of its neglect of materia medica and therapeutics, although the pharmaceutical profession itself is by no means blameless.

As usual, in medical history, the pendulum has swung from one extreme to the other. Formerly, drug therapeutics was everything in medical practice and preventive medicine a dream; now preventive medicine is everything and drug therapeutics is nothing, relatively. The truth is, of course, between the two extremes. There is a brilliant future for preventive medicine, but there can be, also, an equally brilliant future for drug therapeutics. It is most desirable, of course, that every step be taken to prevent disease; but when disease is present, the patient does not care then to know how he got it, or how he can avoid getting it again; what he wants to know is what relief he can get *now*. He is not particularly keen about being "an interesting case" *only* to his physician! He wants something done, being of the opinion of Jacobi, that, "Those who die, die 100 per cent."

Some one has said that the medical profession has "run after false gods" and "fallen down on its job," that it does not get as successful clinical results as it did when drugs were more generally used (the death rate of pneumonia, for example, twenty-five years ago was 25 percent; to day it is from 30 to 50 percent), and that in consequence, the confidence of the public in physicians has become so weakened that osteopathy, Christian science, and patent medicines particularly, have obtained their present widespread vogue.

But, whether this is true or not, the fact remains that thousands of years of clinical experience have shown that drugs, rightly used, have real possibilities of usefulness in clinical conditions. It may be that the results gotten cannot always be explained with modern scientific exactitude—the individual drug reaction in the treatment of disease may be too variable to do so—but this does not justify the neglect of materia medica and drug therapeutics shown by many of the medical profession in recent years.

Drugs have positive clinical values, and these should be as accurately determined as possible to the end that the wheat may be separated from the chaff and utilized for the benefit of sick humanity. If empirical therapeutics is anathema from a scientific viewpoint why not develop rational therapeutics, as advocated years ago by Dr. Horatio C. Wood, the ablest therapist American medicine has ever produced?

The old-fashioned doctor with his intimate knowledge of the possibilities and limitations of drugs in the treatment of disease is being superseded by the new-fashioned doctor who thinks chiefly in terms of preventive medicine; and unless the medical profession awakens to the very serious dangers that menace it through its neglect of materia medica and drug therapeutics, with the consequent insufficiency of clinical results and the weakened confidence of the public, the influence and prestige of the medical profession will be seriously imperiled.

The medical profession needs nothing to-day so much as to be born again in a new faith in the rational use of drugs for the treatment of disease, both to

ensure and promote the growth and development of the science and art of medicine and for the better preservation of the health and lives of the people.

And when this is done, then the old-fashioned pharmacy and the old-fashioned pharmacist will again come into their own. God speed the day!

MANUFACTURE OF AMPOULES.*

BY CHARLES L. BARTHEN.

The methods as well as the advantages of administering medicinal remedies, hypodermically, by means of Hypodermic Tablets, Biological Serums, Antitoxins, etc., are well known. But "ampoules" which are hermetically sealed, glass bulbs, containing standardized and sterile, aqueous or oil solutions of drugs or medicinal chemicals, are considered as comparatively new products on the North American market, although they have been in very common use in Europe and South America for a great many years.

With but very few exceptions the content of ampoules are specifically intended for subcutaneous, intramuscular or intravenous injections; therefore possess all the advantages that hypodermic administration affords.

There are, however, three paramount advantages to be gained by the use of ampoules; namely, convenience, accuracy of dose and the ready to use sterile product.

In view of the facts I have just stated, it is reasonable to expect, that the greatest care, accuracy and aseptic conditions should be observed in the manufacture of ampoules, so that even the most exacting physicians will not hesitate to use them.

I shall endeavor to outline in detail the manner in which ampoules are manufactured in the Laboratory where I am employed.

Manufacturing and Filling of Solutions.—Ampoule solutions with very few exceptions do not contain any material other than the actual medicament and the solvent. The solutions must be neutral in reaction or as near neutral as possible, so that when injected they will not cause any irritation, pain or shock. Therefore they are standardized by chemical tests and assays. As a demonstration I will cite a few examples. Sodium Cacodylate solutions must be very faintly alkaline, and free from Cacodyl, the ester of Cacodylic Acid, which is objectionable. Alkaloidal solutions, such as Quinine, Morphine, Atropine, Strychnine, Emetine, etc., must be faintly acid. Solutions of iron salts must be neutral. Solutions of Adrenalin, Pituitrin, Ergot, Strophanthus, and similar products, are submitted to a physiological assay. Mercurial compounds contain some local anesthetic, because there is no other means of preventing them from causing pain, without changing their very nature.

Filtering.—The solutions are filtered first through paper, then through a Berkefeld or Pasteur filter, the latter preferably because it is more dense. The solutions are forced through the filters with compressed air, and the filtrate received in sterilized bottles. Bacteriologists claim that the solution as it leaves the Pasteur filter is sterile.

* Read before Detroit Branch A. Ph. A., April meeting, 1918.

Empty Ampoules.—The empty ampoules are made from thoroughly annealed and alkali-free glass tubing. If the glass were not thoroughly annealed, the ampoules would not only be brittle but would crack and break when heated at the high temperature which is necessary to sterilize them. If the ampoules were not made of alkali-free glass, the excess alkali would cause the precipitation, in time if not immediately, of a great many drugs or chemicals from neutral or faintly acid solutions. This is especially true of the alkaloids and iron compounds. In the case of Adrenalin and Pituitrin, complete decomposition takes place in a very short time if there is the slightest excess of alkali present.

The test which we apply to determine the alkalinity of the glass is as follows: The ampoules are filled with a neutral phenolphthalein solution and sealed, then placed in a steam bath and heated until the solution assumes a pink tint, noting the time it requires for this reaction to take place. Some ampoules will cause the solution to turn pink immediately and others will have no effect on the solution after heating for 24 hours. We do not accept any glass that will not meet a test of three to five hours.

The tubing is thoroughly washed and dried, and the ampoules are made with the stems sealed, thus preventing any dust, etc., from getting inside of them. The empty ampoules are sterilized with dry heat at a temperature of 160° C., for one hour, allowed to cool, and just before filling the sealed end of the stem is cut off.

Filling of Ampoules.—Before a process or method of manufacture of a new product can be perfected a considerable amount of experimenting has to be done. This has certainly been true of ampoules. Without a doubt the greatest difficulty encountered in the manufacture of ampoules, has been to obtain a suitable and efficient method of filling each and every ampoule, with an accurately measured amount of clear and sterile solution. You can take a hypodermic syringe, draw in a definite amount of solution and expel it into an ampoule; this is an accurate but very expensive way, or you may fill ampoules by means of a burette, but the success of this method depends entirely upon the eye and accuracy of the operator. After constantly experimenting for years, we have adopted machines that put exactly the amount of solution we desire into each ampoule; these machines fill from 25 to 35 ampoules a minute. The ampoules are then sealed by means of a blast lamp, the heat of which softens the glass, and the edges of the stems are welded together into a solid mass, making a hermetic seal. After filling there always remains, in the stems, a very small amount of solution, which sometimes causes considerable trouble when the ampoules are sealed, particularly with solutions of Caffeine and Sodium Benzoate, and Sodium Cacodylate. These salts when heated with the glass combine with it, making the tip of the ampoule so brittle that the slightest jar will cause it to crumble or fall off. In the case of Quinine Salts the intense heat causes the Quinine to char, so that when the ampoule is agitated, you will notice small specks of charcoal suspended in the solution.

To obviate the troubles just mentioned we wash down this liquid with a little distilled water.

Sterilizing after Filling. In spite of all the precautionary methods we may adopt in order to maintain aseptic conditions while handling the solutions, apparatus and ampoules, there is a possibility of the solution becoming contaminated

with bacteria. To insure the sterility of the product, the ampoules after filling and sealing, are placed in sheet metal boxes, the top and bottom of which are made of metal screening, and then sterilized by means of steam or hot water, at a temperature the product will permit, for 15 minutes to 1 hour, on each of 3 consecutive days. The temperature is never less than 60° or more than 100° C. You might ask the same question that has so often been submitted to us in the form of a suggestion, as a measure of economy and convenience. "Why don't you sterilize all your ampoules in boiling water for 1 to 3 hours and accomplish the task rapidly, efficiently and economically?" As an answer to this question I will try to explain to you the necessity and what the advantages are of so-called fractional sterilization.

A great many of these delicately adjusted ampoule solutions cannot be subjected to the temperature of boiling water, for the length of time necessary to sterilize them, without partially, if not completely, decomposing the product. Consequently these solutions will no doubt be sterile, but they will have little or no therapeutic value.

The majority of bacteria with which ampoule solutions are liable to be contaminated, can be destroyed at the comparatively low temperature of 60° C. Many of these bacteria are spore-bearing, and while the bacteria can be destroyed at 60° C., the spores are resistant and can only be destroyed at the high temperature of 100° C.

A spore is a minute ovoid body in certain organisms, which gives rise to new organisms by germination. As for example, a solution may be contaminated with spore-bearing bacteria and sterilized at 60° C., on the 1st day the bacteria would be destroyed, but the spores will only be incubated and inside of 12 to 24 hours develop into bacteria; on sterilizing the 2nd day, this newly developed bacteria would be destroyed, and if any spores remained, that were not incubated during the first sterilization, which is very probable, they will be incubated during the second sterilization, and then develop into bacteria, which would be destroyed by sterilizing on the third day. After the ampoules have been sterilized, samples are sent to the Biological Department, where a bacteriologist tests them for sterility. It requires 5 days to complete this test.

To detect imperfect sealing, flaws in the glass, which up to this stage of the process did not appear, and cracks caused by being jostled about in the sterilizing boxes, we submit the ampoules to what we term a Blue Test.

Blue Test.—The blue test is made in the following manner: The metal box, containing the sterilized ampoules, is placed in a vacuum box that is partially filled with water in which is dissolved a small quantity of methylene blue. The cover of the vacuum box is clamped down and suction applied, which draws out the solution from the defective ampoules; then when the vacuum is broken by opening the air vent, the air, as it enters the chamber, forces the methylene blue solution into these defective ampoules.

Washing.—The ampoules are washed by immersing the box containing them first in warm soap suds, then clear water; those containing blue water are picked out and discarded, and the perfect ones are set aside to drain; they are then ready for finishing.

Finishing.—The special shaped ampoules are labeled and cartoned by hand; the others by machine. We have machines that label from 50 to 60 ampoules a minute, and carton them at the rate of 40 to 50 a minute. The ampoules are so packaged that they are always in an upright position, and the stems well protected, so that they will come into the consumers hands in a perfect condition.

In order to maintain aseptic conditions in the department where ampoules are manufactured, it is absolutely essential that everything must be kept scrupulously clean. All cleaning and dusting should be done at night or at a time when manufacturing is not in progress. All employees in the department are clothed in white uniforms, not for the sake of appearance, but to impress upon them the necessity of cleanliness.

LABORATORIES OF PARKE, DAVIS & Co.,
DETROIT, MICHIGAN.

IF THE DRUGGIST'S LANDLORD RAISED HIS RENT WOULD HE BE JUSTIFIED IN ACCUSING THE LANDLORD OF PROFITEERING?*

BY FRANKLIN M. APPLE

In these stirring, troublesome war-times one repeatedly hears of profiteering; also of increases in rent, and frequently the profiteering and rent-raising accusations are directly associated.

The latter cases are the ones we will take up briefly for consideration, and endeavor to ascertain if there is any justice in the charge that an increase in rent, at this time, by a landlord justifies the accusation that he is a profiteer.

In order that we may reach a clear and just decision, it is absolutely necessary that we carefully analyze the question, and "lay upon the table," as it were, the facts in the case as they apply to both parties concerned.

What are the facts involved?

The landlord supplies the property, which represents an investment of his funds, from which he is entitled to a fair net return, as interest earned by said funds.

The druggist supplies the tenant, upon whom the landlord depends, for income from his investment in the property, for, if the property were unoccupied, it would prove to be a source of expense instead of a source of income to the landlord; hence it can be seen that each one is a benefit to the other one.

The question as to profiteering upon the part of the landlord, quite obviously, depends upon the amount of net income he demands from his funds involved.

I will call your attention to the fact that I lay stress upon the question of *net income* enjoyed by the landlord as a reward for the use of his funds, the care needed in overseeing the upkeep of the property and the risks assumed by him.

Let us consider some of the facts in the case that cannot be ignored.

When considering the question of upkeep of a property we are confronted by the cost of materials and the demands made by the artisans and the laborers for their skill and labor, and everyone who has had any experience along this line can vouch for the unprecedented advance in price of these essential factors. When

* Read before the Pennsylvania Pharmaceutical Association, 1918 meeting.

one observes in the daily papers that carpenters are offered seventy-five cents (or more) per hour, with time-and-a-half to double time allowances for time over 8 hours per day, we can judge of the deductions the landlord must make from his gross income (rent the tenant pays) from his property. A few days ago I was informed by a friend, who is a carpenter, that one of his fellow workmen had earned \$91.00 the previous week, having worked considerable overtime at the advanced rate offered for such extra hours of labor.

A recent experience with a plumber, who supplied about 3 feet of 1-inch black iron pipe, an elbow of the same size and one washer, for which a charge of \$1.00 was made, and a charge of \$2.50 per hour for a plumber and helper, shows what allowances must be made for repairs to the plumbing system of a property by a landlord.

What is true of plumbers and carpenters is true of other skilled artisans and unskilled laborers are offered at least 35 c. per hour for their efforts.

The experience of the individual, concerning the increased costs of maintenance of a property, is the case with municipalities, as a result of which the tax rates must be (and have been) increased, which adds another item to the expense account of the property, which must be allowed for in arriving at an equitable rent.

In the past two years the tax rate of Philadelphia has been increased 85 cents per \$100.00 assessed valuation of properties—25 cents in 1917 and 60 cents in 1918—hence it can readily be seen how fortunate the druggist tenant has been who had a lease for a term of years at a designated rent.

The managers of the Insurance Companies have learned that the increase costs of doing business had not made any exceptions to their companies as a result of which increased premiums are demanded for fire and other forms of insurance, which added expense falls upon the shoulders of the landlord to keep company with the other increased expenses he is privileged to enjoy.

If you will carefully inspect your insurance policy, you may be surprised to find among the conditions under which you are granted protection against fire is the following: "This company shall not be liable for loss caused directly or indirectly by invasion, insurrection, riot, civil war or commotion, or military or usurped power, or by order of any civil authority."

You will readily observe that in times of war or insurrection the risk assumed by the owner of a property is materially increased; hence he must protect himself as far as possible by demanding an increased premium on the risk (as is customary in all forms of insurance, the premium being regulated by the risks assumed).

As the Federal authorities are levying rapidly increasing income taxes, where-with to carry on the war for democracy and liberty, into which we have been forced by the insolent, arrogant, brutal, treaty-defying hordes of Middle Europe, this fact must not be overlooked when tabulating the just claims of the landlord.

We have now compiled a list of expenses (all of which have materially increased in recent years) that the landlord cannot escape, and which he must bear in mind when endeavoring to decide upon an equitable and just rent for his property. All of these must be deducted from his income received as rent before he can calculate the rate of interest earned by his money invested.

We now arrive at a point where considerable difference of opinion may arise, but, if we will approach the question with an open mind and in a spirit of fairness, I believe that no serious discord will result.

Inasmuch as the cost of living has materially increased, and investments in all sorts of commercial enterprises are netting greater income to the investors, is the landlord entitled to a greater return upon his investment than he previously enjoyed? Quite likely it will depend somewhat upon the question as to "which side of the fence you are on" in this case, as the renter certainly does not relish an increase in expenses in the form of rent.

To those who entertain the idea that an increase in rent at this time indicates profiteering, I will direct their attention to the fact that the investor must protect his principal involved by guaranteeing a net income that will prove as attractive in proportion to other forms of interest as the past incomes have proven to be; otherwise he stands a good chance of losing a portion of his capital, through the diminished market value of his property. This certainly necessitates a greater percentage of net income than in the past.

Our Federal authorities are compelled to offer higher rates of interest upon the best securities in the world, in order to attract investors, and as all forms of investment are based upon the standard set by the Bonds of the U. S., it is axiomatic that other forms of securities, including real estate, must show higher rates of income than in the past, in order to safeguard the market value of the investments.

If such action is not taken by the landlord he will unquestionably be forced to sustain a loss when he disposes of his property—by desire or through necessity—as the net income of real estate determines its market value.

Many instances could be cited where the market value of properties were materially reduced through the reductions in rent that were necessitated by various influences beyond the control of the owners thereof.

Mistaken ideas of the carrying charges of properties are obtained by the public through the misleading displays made by some builders in their efforts to show how great an amount of rent can be saved by purchasing one of their houses, thereby making the landlord class of investors appear to be hard-hearted, usurious persons. This practice should be controlled by legislation as many innocent parties come to grief when they experience the true costs of maintaining their properties.

As far as the druggist tenant is concerned, he has no capital invested in the property and assumes no risk except the amount agreed upon in the terms of the lease to be paid to the landlord, and if he is an untried quality, the landlord must take a risk upon his integrity, his business qualifications and his application to business; hence it is apparent that the element of chance is decidedly in favor of the tenant.

I am not unmindful of the fact that the landlord, as owner of a specific property, has the final decision as to the use to which it shall be put—except those businesses that depend upon a license from the courts, and those possibly restricted in the deed for the property; but he has his hands tied when he signs a lease for a term of years, just as the tenant is obligated to pay the rent for a like period of time— if he remains solvent.

When basic conditions of any country become so radically disturbed as they have become in our land, it is logical to expect the relations between the landlord and tenant will be more or less altered from the old standard and the greater uncertainties that all of us must look forward to in all walks in life, including retail druggists, necessitates greater elasticity in the terms of leases written and signed in the future.

If a landlord demand increased rent for his property from a druggist, his tenant, he should be willing to present a display to the tenant, upon demand, showing the increased costs of maintenance of his property, and the tenant should be willing to concede a higher rate net income to the landlord, for reasons previously stated.

If a lease is demanded for a period of years, to protect his business, the druggist should be willing to assume the payment of all increases in taxes, and extra upkeep costs of all sorts and descriptions, thereby guaranteeing a measure of protection to the landlord that his income from his property will net him about a certain percent upon the money invested—or more justly upon its market value—which amount he could invest in some other forms of security of equal stability.

As the landlord presents security to the lessee in the form of tangible assets, it would not be unreasonable upon his part to demand security in some form for the faithful performance of the contract upon the part of his tenant, and I look for greater demands along this line in the future than has been the custom in the past, as the uncertainties that will exist in business circles after the termination of this frightful war with its unprecedented and unknown amount of expenses, will add materially to the hazards of engaging in business—and the drug business will be no exception to the general rule.

Under such a state of affairs the landlord will be compelled to assume greater risks of failure by his tenant; hence he must demand a larger income from his investments.

Having presented for your consideration a number of facts that directly apply to the question of the relationship of landlord to tenant, and reversely, I will leave it to your sense of justice to decide if the landlord who has raised the rent of his druggist tenant can be honestly accused of profiteering.

If the increase of rent has been a moderate one (whether accompanied by an explanation as to the cause for the additional amount of rent demanded or not), I should not feel justified in entertaining any such thoughts. If the extra amount demanded is as great as 50 percent or more, I should expect a satisfactory explanation from the landlord as to the necessity for such action upon his part, and if it were not forthcoming I should be forced to believe that his silence indicated his inability to prove himself innocent of profiteering.

It is to be understood that these conclusions have been based upon economic conditions as they exist at present, and any serious alteration of basic conditions would demand a new investigation and more calculations, with probably a different decision.

It is a serious matter to accuse one's fellowman of profiteering in these days of stress and trial, for it is a more or less arraignment of their patriotism and humanitarianism; hence let us not judge harshly or unjustly.

THE APOTHECARY, A LITERARY STUDY.*

BY EDWARD KREMERS.

10. THE TWO SONS OF A DANISH APOTHECARY.

Opposite the harbor of Kiel, the naval base of Germany, and between two larger Danish islands, there lies the long but narrow Langeland. It is but 4 to 8 Km. wide and 50 Km. long, hence its name; its area is but 275 square Km. According to recent statistics, it has a population of only 19,541 inhabitants. The only city in the island is Rudkjoebing,¹ which at the same time boasted of 3,447 inhabitants, and a harbor which about 150 vessels regarded as their home port. Yet this insignificant place gave to Denmark one of her greatest statesmen of the nineteenth century, and to the world one of her famous scientists. What is more, these two men were brothers who first saw the light of day in the home of an apothecary. The love of truth as expressed in nature and nature's laws was instilled into their minds by their father, the love for all that is true and noble having previously been implanted in their young hearts by their mother. Such at least is the story told by Hans Christian Andersen in his tale of the "Two Brothers."

HANS CHRISTIAN ANDERSEN.
From Lithograph in "Illustration" by Emil Bachmann.

Hans Christian, the older of the two brothers, was born August 14, 1777, in Rudkjoebing. At the age of eleven he was set to work by his father in the apothecary shop,² where "he developed a taste for the natural sciences." Apparently, to make up for the instructional deficiency in so small a place, he was sent away from home when eighteen years of age to receive instruction in the classics. For proficiency in these studies he received academic honors in 1796. In 1798 he received the medical prize of the University of Copenhagen, and in 1799 he was

* For the illustrations the writer is indebted to Apothecary Hoem, of Copenhagen, and to Apothecary Bajer, of Rudkjoebing. The cuts for illustrating this article were kindly loaned the JOURNAL OF THE A. P. H. A. by the *Danish Apothecary's Apotheker-Zeitung*.

awarded the doctor's degree in philosophy. Thus, while his father set him to work in his apothecary shop at an early age, this apprenticeship was not allowed to interfere with a liberal education in the classics and an equally broad introduction into the study of the natural sciences. One has but to look over the list of his publications³ to see that he never allowed his specialty to dwarf him intellectually.

In 1800 he acted as manager of the Manthé apothecary shop in Copenhagen, and at the same time delivered his first lectures in chemistry before the Academy of Surgery. After this he made his first trip to the continent, where he remained several years visiting the greater part of Germany, also France and Holland. He returned to Denmark in 1804. Somewhat later he was appointed to the professorship in physics at the University of Copenhagen. In 1824 he founded the Danish Society for the Advancement of Science. In 1829 he was made Director of the Polytechnic School in Copenhagen. In 1840 and 1850 he received government recognition by being appointed conference councillor and privy conference councillor, respectively. He died March 9, 1851.

ANDERS SANDOE OERSTED.
(From Lithographic Institute on Em Baerentzen.)

His world fame, Oersted owes to his discovery, in 1820, of the deviation of the magnetic needle by the electric current, thereby establishing the laws of electromagnetism.⁴ However, not a few of his earlier writings are of a chemical nature, and one of them in particular, *viz.*, his *Om et nyt Aesk i Peberen*, the discovery of piperine in pepper, only a few years after the German Apothecary Ser-tuener had discovered the alkaline properties of morphine, reflects his earlier pharmaceutical training.

The younger brother, Anders Sandoe, was born December 21, 1778, became a jurist and later statesman. In the latter capacity he advanced from one position to another until, in 1853, he was appointed prime minister by the King of Denmark. He died May 1, 1860.

However, to return to the apothecary shop, which is the scene of Andersen's story. According to the fifth edition of "*Den Farmaceutiske Stat i Danmark*, 1915,"⁵ published by the Danish Pharmaceutical Society in 1917, the "Rudkjoebing Apotek" was established Nov. 2, 1705, by Christopher Gottfried Becker. In 1741 it passed into the hands of Anders Joergensen and in 1773 into those of H. Vennenghausen. On June 5, 1776, hence only a month before the declaration of independence of the American colonies from England, it was purchased by Soeren Christian Oersted for 600 Rbdl.⁶ Inasmuch as neither of his sons followed in the footsteps of their father, the apothecary shop did not remain in the family, but passed into the hands of one Anthon Jacobaeus, March 10, 1806. After that it changed hands several times and since 1889 its proprietor is Christian August Pilegaard Bauer.

Statue, Hans Oersted, in Oersted Park, Copenhagen,
unveiled September 25, 1876.

But now, as to Hans Christian Andersen's story of the two brothers. It will be seen that the Christian names of the Danish story teller are those of the elder of the two brothers, the world-famous scientist who emanated from the modest apothecary shop in Rudkjoebing. The German translation is one of the

seventeen selected by O. B. Super in his *Adersen's Maerchen* of the Heath Modern Language Series. However, the exceedingly meagre comments in the "Notes" contain nothing whatever pertaining to pharmacy. The English translation here reproduced is taken from the 1870 edition of "Stories and Tales" by Hans Christian Andersen, of Houghton, Mifflin Company, who kindly gave permission to use their text for this purpose.

"On one of the Danish islands, where ancient judgment seats loom up mid the cornfields, and mighty trees lift their heads in the beech forests, lies a little town, with red roofs over the low houses. In one of these curious matters were being prepared over the coals and embers on the hearth: there was testing in crucibles; there was triturating and distilling; there was pounding of drugs in mortars; an old man stood over the whole.

"'One must rightly combine the right matters,' said he 'yea, the right, the fitness, the truth in each created thing, we are to recognize and hold.'

OERSTED'S APOTHECARY SHOP.

The following words are on the plate under the clock "*Tiden-er-kort Brug-den-vel:*" Time is short—utilize it well

"In the chamber, by the good good-woman of the house, sat two sons of hers—yet young, but with grown thoughts. Of right and reason had the mother ever counseled them, and to hold fast to truth, which is the face of God made visible on earth.

"The elder of the boys seemed arch and pert; his delight was, to read of nature's

laws, of suns and stars—no tale could give him better joy. O, what bliss, to go on journeys of discovery, or to contrive to imitate birds' wings, and fly!—yea, that were the true thing to find! Father was right, and so was mother; 'tis truth doth hold the world in shape.

"The younger brother was of a quieter mind, and lived but in his books; did he read of Jacob—how he clad himself in sheepskins to resemble Esau and therewith to wrong him of his right of birth—in anger the boy clinched his little hand, vexed at the fraud; did he read of tyrants, and the wrong and misrule that reign in the earth—tears filled his eyes. Thought of the right and of truth, that ought and were to triumph, swayed him mightily. One night the little one had gone to bed; but the curtains hung awry, and let in some light upon him, by which he lay with book in hand, and read to end the history of Solon.

"And thought did lift and bear him strangely on, 'twas as if the couch had grown into a vessel under sail—was he dreaming? or what meant it else? He glided over rolling billows—coursing swift athwart the sea of ages; his ear caught Solon's voice, proclaiming, in the stranger's tongue—and yet the boy did understand the Danish motto: 'Justice buildeth up a land.'

"And the Genius of Humanity stood in the midst of the lowly chamber, bowed over the boy, and left a kiss upon his brow: 'Be strong in glory, and strong in the battle's heat; with truth fixed in thy breast, go forth on thy way unto the home of truth!'

"The elder brother was not yet abed; he stood at the window, gazing out upon the mists that arose from the plain; they were not elves, a-dancing over yonder; the old nurse, 'tis true, had taught him so; but he knew better; they were vapors, warmer than the air, and hence they arose. A shooting-star lit up the sky, and the boy's thoughts were instantly gathered up from the mists of earth, into the region of the shining meteor. The stars twinkled in the firmament, and it was as if golden threads were floating from them to the earth.

"'Come with me!' it sang and rang in the boy's heart, and the Race's mighty Genius bore him swifter far than bird or arrow, or aught of earth that flies—out into Space, where ray on ray from star to star bound all the rolling globes to one another; the earth was spinning in the rare empyrean city crowding close on city. Through the spheres resounded—

"'What is space, and where is distance, while the lofty spirits of Thought bears thee on high?'

"And again the youth was at the window, peering forth, and the younger brother lay abed, and their mother called them by their names:

"Andrew and Hans Christian!"

Denmark knoweth them, the world knows both the brothers.—"Oersted."

BIBLIOGRAPHY.

1. Kjøebing, is a place where merchants (Ger. *Kaufmann*) assemble, hence a market.
2. A copy of Forchhammer's biography of Oersted (G. Forchhammer, *Hans Christian Oersted*, Kjøbenhavn, 1852) is in possession of Yale University Library, which kindly loaned its copy to the University of Wisconsin Library for use at Madison.
3. Such a list of Oersted's publications may be found in Forchhammer's biography already referred to.

(4) As Oersted states in a Latin brochure, a German translation of which appeared in *Gilbert's Annalen*, vol. 66 (1826), p. 295, this observation was first made in connection with one of his lecture experiments, and later repeated in the presence of personal friends. Inasmuch as he regarded the observation of fundamental importance, he mentions the names of those who saw the experiment as witnesses. The importance of the observation and the consequences derived therefrom, are dwelt upon by Rosenberger in his *Geschichte der Physik*, 3rd part, p. 173.

(5) For copy of this work, the University Library is indebted to the generosity of Mr. Otto J. S. Boberg, of Eau Claire, Wisconsin, who received his pharmaceutical education in Danish apothecary shops and at the University of Copenhagen.

DRUG STORE RECOLLECTIONS.*

BY J. N. HURTY, M.D.

Col. Eli Lilly beguiled me into the drug business. I was a callow youth of 16 years and 9 months, and was to graduate in high school the spring of 1870. It was April—Col. Lilly lived in a humble frame dwelling opposite the school house. He was raking his yard that bright spring morning, and I, a callow, conceited and centered youth, with strap-bound books, was trudging unwillingly to school. "Hey, John," said the Colonel, and I stopped. "Come in here, won't you, I want to speak to you." I went in and he unfolded his story which shaped my life work. Up to that time it had never entered my mind to become a druggist. The Colonel made a "center shot." All that day and the next, and the next, and for two weary weeks until school ended, I thought, I dreamed, I contemplated upon becoming a druggist. My expectations were keen, my enthusiasm was at a white heat. I walked by the Red Front Drug Store (that was the name of the Colonel's emporium of drugs and simples) at least twenty times a day. My salary was to be three dollars a week and what could I not do with such a princely income? Priorly I had earned one fifty per week selling and carrying papers, and here was a jump of one hundred percent. It isn't every boy I said to myself who early in his life's career has his salary doubled. The morning of the first day I awoke at four and it seemed an interminable time until 6.30 A.M., when I was to meet the Colonel at the big double doors of the Red Front. I was there twenty minutes before time, having eaten scarcely any breakfast.

The Colonel appeared a little behind time, which surprised me greatly. He inserted his big iron key, which I remember was about eight inches long and weighed at least three ounces. The door opened and supposedly my life work was before me.

"Sprinkle the floor and sweep out," were the orders, and willingly I went at it. I had for a year sprinkled and swept the floor of the news stand by the post-office and so the work was done acceptably. The show cases, the counters and the base board of the shelves were then dusted with a feather duster and the store was ready for business. "Fix the lamps," was the next command. Eight coal oil lamps suspended from three two-armed fancy iron chandeliers lighted the room. I started to take down the lamps two at a time to show my efficiency.

* Read before Historical Section, A. Ph. A., Indianapolis meeting, 1917.

But, alas, I fell off the shaky step-ladder, broke both of the vitreous dispensers of light, skinned my shins and made an awful muss of broken glass, wicks and coal oil upon the recently swept floor. Of course, the Colonel was startled and he exclaimed—"My God, what a stupid ass you are." But seeing my plight and the sorry look in my face, he relented and broke into a paroxysm of laughter. My life was saved. Now that he had laughed I knew that my execution was not near.

In about two weeks I had another accident which I might just as well tell right here. The cellar was entered by a flat door in the floor lifted by a ring. Just above this door on a wide shelf was a row of one-gallon glass-stoppered bottles which held stock such as paregoric, laudanum and Huxhams Tincture. One of the bottles contained a gallon of freshly made bay rum, which the Colonel had given a slight yellow color with tumeric. It was this bottle which came very nearly undoing me, and it happened in this way: I was ordered to the cellar, to bring up a bundle of handles for white-wash brushes. They were about two feet longer than ordinary broomsticks. I was told to be careful, and I resolved to be, but alas and alack, man proposes and God disposes. On the stairs I slipped and the end of the bundle fell with heavy impact upon the bay rum bottle and shattered it into a million pieces. The bay rum poured forth upon my head and down my neck, saturating me with its fragrance. It was a veritable deluge of bay rum. The Colonel did frown "sure nuff" this time. His face plainly said, "this brat is impossible." I had nothing to say and could only look at the Colonel, and he looked at me. There I stood, dripping with fluid and the fragrance of bay rum filled the room. A customer appeared and viewed the wreck, and again the ridiculousness of the situation became ascendant, and we all broke forth in laughter. My laughter was somewhat forced. But I was saved.

Concerning bay rum. Its drug store days are not what they were. The barbers were our best customers, and in these degenerate days the barber-supply houses are the sources for this delectable cosmetic and also for lavender water, pomade and cologne.

CONDITION POWDERS.

Condition powders sold splendidly fifty years ago. We made our own and the "Red Front Lilly Condition Powders" had a reputation which was not bounded by county lines. I have made barrels and barrels of these condition powders and packed thousands of cartons. We bought copperas, alum, rosin, epsom salt, sulphur and bicarbonate of soda in five-barrel lots. Foennugreek was, of course, an ingredient of our superlative mixture. The copperas, alum and rosin had to be powdered and, the cub powdered them. And now, say—did you ever powder a barrel of dried copperas, a barrel of dried alum, and a barrel of rosin in a fifty-pound iron mortar and sift these through a fine sieve? It certainly is some job. The iron pestle had a hickory extension handle attached to a heavy cord which passed through a pulley overhead and was counterbalanced with a small sack partly filled with stones. Oh! the dust! It filled my hair, my eyes my nose, my mouth. It even seemed to penetrate my mind and soul. For weeks after I had made a five-barrel batch of our unexcelled, unequaled and superlative condition powders, I actually oozed sulphur, copperas and foennugreek from every pore. For hogs the powders were modified by adding one-half pound of powdered arsenic to each fifty pounds. As for testimonials, we had them by the

thousands. Every user of our powders insisted there was nothing like them either in the heavens above, the earth beneath, or the waters under the earth, and not one of the ginks was in the least degree competent to testify. Yet their testimonials were a go. All I can now say for them is—as far as I know, none of the poor beasts who were made to eat the powders in their food died because of the foolish medicine.

BAKING POWDER.

Baking powder was another great seller at the Red Front Drug Store. Making it was a clean but dusty job. When a batch was finished and safely placed in its paper-lined barrel, I was white as a miller, and again mouth, nose, ears, eyes and hair were fully, completely and absolutely filled and saturated. Indeed, after mixing a barrel of Lilly's par-excellence baking powder, my soul, mind and body were not made lighter, but heavier.

DOVERS POWDER.

Has any one here under fifty ever made Dovers Powder? I doubt it. Did you ever know its ingredients? Well, I have made it, and I made it too by Colonel Lilly's method. First, the potassium sulphate and the powdered opium were stirred in a mortar for one-half hour, scraping down with a broad limber spatula. Then the powdered ipecac was added a little at a time with grinding and scraping ad infinitum. Finally, the compound was placed on a large sheet of paper and again mixed and mixed with a spatula. All of this mixing and rubbing was not entirely to effect the thorough admixture of ingredients, but also, "by human contact and motion to impart certain obscure qualities not otherwise to be secured."

PATENT MEDICINES.

Patent medicines simply were on the rampage in my early drug store days. And yet—to-day, we find school teachers and preachers who have not risen out of the patent medicine stage of ignorance. Fifty years ago Helmbold, Jayne and other patent medicine kings wallowed in wealth. They simply dripped with gold. I remember reading an account of Helmbold's great glorious golden glory at Long Branch. Solomon, Croesus, nor any of the ancient gold bugs could touch him. He had 'em all beat a hundred miles. And to think Helmbold's great fortune was produced from nothing. Absolutely nothing. No, I am wrong, it was based upon the stupidity, ignorance, superstition and irrational credulity of mankind. And all these we shall never lack.

The funniest patent medicine stunt that was ever pulled off was "Walker's California Vinegar Bitters." Our little country drug store purchased these bitters in fifty-case lots. Thousand sung their praise. The testimonials, positively asserting the life-giving and curative powers of Vinegar Bitters, came from farmers, robbers, doctors, merchants, chiefs, and not one grain of the entire testimony was worth a darn. Walker's California Vinegar Bitters was, we were told, simply aloes soaked in weak vinegar and literally wrecked the intestines into which they were introduced. Then there were bitters and bitters and other bitters.

Joseph R. Perry, the genial one-time editor of the *Indiana Pharmacist*, tried a bitters trick which won and which brilliantly reflected the credulity of people. He had in his stock odd bottles of several kinds of bitters with wrappers spoiled

and worn and unsalable. He bulked the bitters in a keg, added some whiskey, and rebottled with a flaring red label, announcing— "*The Most Wonderful and Powerful Stomachic Bitters.*" *A New and Great Discovery. Life Giving, Life Saving, Strength Making.* Upon the label were two pictures, one of a miserable individual and the other of a strong, ruddy person, showing before and after taking.

The wonderful medicine sold readily. The first supply was soon gone and the demand had only begun. Then Joe bethought himself and pondered as to whether or not the joke should be continued. Joe was honest, and, of course, therefore impractical. He just couldn't keep up the swindle and he didn't, and frankly told his customers and they voted him a fool and unworthy of patronage. But what are you to expect of a world in which millions of people will defend divine right to rule and allow themselves to be plunged into a whirlpool of human blood simply to exalt a paranoic with a withered arm, a running ear, and a cancerous throat.

ASAFETIDA.

Did you ever see a one-hundred pound box of asafetida in a little country drug store? What do you suppose could be done with it? Well, the Lilly Red Front Drug Store, actually bought the malodorous drug in one hundred pound lots, and we powdered much of the vile stuff in a big iron mortar.

In those days every child was a stinker because of a little bag of asafetida suspended over its chest. It was a rank stupidity, crass ignorance and silly, but it was done by Christian people. Several times in my early drug store experience I grew faint-hearted and seriously thought of engaging in some life work that had fewer irritating, disgusting, tiring and repugnant features. Especially strong was this thought when I was called upon to powder dried asafetida in an iron mortar. That job was the limit. But evidently I was weak; anyhow, not strong enough to quit a business which dealt in asafetida.

PLASTERS PILLS LOZENGES.

I wonder if there are any pharmacy kids here present who ever spread split-skin plasters, made compound cathartic pills by the quart and cut ten-pound lots of tamarind, fig and senna lozenges, or made pecks of cough troches? As I remember my sensations I felt like jumping and shouting when I had finished a batch of compound cathartic pills which filled a drawer holding at least a peck. My first batch of tamarind, fig and senna lozenges brought upon me a mighty catharsis for despite warning I persistently nipped off pieces of the mass to satisfy the gustatory pleasure hidden therein.

I watched Colonel Lilly spread a plaster with a curiosity which developed into great admiration. First, the white split skin was carefully squared, then tacked to a pine board and strips of calendered paper pasted around the edges. How is this to come out? I almost thought aloud. Then the Colonel carefully spread the melted plaster mass with a spatula, finishing the surface to perfect smoothness. Then came the dusting with tartar emetic, and lastly the paper strips (the paste not yet dry) were skimmed away and there was the finished plaster, an example of the master's skill and art. I was a proud pharmaceutic kid when I finally could turn off a pitch plaster which would pass inspection. The plaster

was dispensed in a big envelope made by ourselves out of stiff manila paper. I am quite sure large paper envelopes were not purchasable on the market in those days.

SODA WATER.

Yes, we had a Tiffits Fountain, and after I had learned how to make syrups and charge fountains I voted it a nuisance. On circus days and at county fair time, people stood in line to drink our soda water, which had the reputation of being the best in town. The washing of the glasses and the slop made at the fountain led to a washing scheme which was conceived by the Colonel and which was not a success. Two hundred glasses, the thick kind, were purchased, the idea being to wash the glasses at a special sink in the rear of the store and bring them forward in trays clean and shining. The plan worked well in a rush with about three boys to keep the glass supply from failing and provided they kept out of the way of the dispenser. But if business lulled the glass washers had little to do and became "stand arrounds" on expense. Only on big days did we work this plan, and on account of its complications the confusion of running to and from behind the counters, it was abandoned.

In 1873 I attended the Philadelphia College of Pharmacy, and when I returned the Colonel one day remarked—"Well, I suppose you know it all now?" The question was kindly put, for the Colonel's great heart would not brook unkindness. "No," I said, "I don't know it all, but I know more than I would have known under your teaching." "Good, Good," he shouted. "You'll come through." But it was Mike O'Hare who said the right thing. "Where have you been so long, Johnny?" asked "old Mike." "Been away to pharmacy college," I replied. "That's right," said he, "make a farmer of yourself."

THE STATE LEGISLATURE.*

BY W. H. COUSINS.

Caesar had his Brutus, Job his boils and Caranza his Pancho Villa, yet none of these much-touted martyrs ever hovered 'round the corridors of a State House and sought to get the attention of the Honorable Jason Jawsmith, chairman of the Committee on Public Health. The trivial demands of the craft of Pharmacy are nothing compared with the howling needs of the populace. Nine-foot bed sheets, the lengthening of women's dresses at both ends and the tax on cigarettes are the average State solon's idea of saving the country and keeping it from going to the dogs the shortest route.

The State Legislature is the most brutal joke of the age, made up, as it is, mainly of an aggregation of unconscious comedians, who, in their serious contemplation of themselves, put Don Quixote to shame. When Heck Rogers of the Cactus and Greasewood "Deestriet" strokes his whiskers, he imagines the seismograph is having a convulsion in Greenwich Observatory, and when approached

* Read before Joint Meeting: Section on Education and Legislation and Pharmaceutical Legislation, A. Ph. A., American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy, Indianapolis meeting, 1917.

on the subject of Pharmacy puts on a pouter-pigeon aspect, leaving the impression on the poor human caterpillar who dared approach him that he can not be bothered with small things. I have been handed everything from a lemon to a block of ice big enough to cool Lake Michigan while trying to get an opportunity to tell the powers that were, that I believed the man who practiced Pharmacy in a wagon should be under the same requirements as the man who practiced Pharmacy in a drug store. It seems that the pharmacist of this country is a kind of legislative step-child, who asks for bread and is given a stone. He pleads for a fish and gets a snake. I call to mind at this time the hard work of a legislative committee in a southern State last year. This committee sought to regulate the itinerant vender of medicines, they made a long, hard fight, they gave up much time and money in the effort, and after it was all over and the smoke of battle had cleared away, instead of placing the vender under the same restrictions that pharmacists are under, the Legislature reduced his tax 50 percent.

A State Legislature is a collection of human curios and would furnish many tips for comic opera if the composers of this mental diet for the tired business man but knew it. We believe that the legislators will eventually fix it so that the pharmacists will have to employ legal counsel by the year in order to avoid breaking some of the idiotic, Welsh rarebit dreams that they have written into the statute book. They seem to view us in much the same light as a rustler is looked upon in the cattle country. We get more attention in the form of prohibitive laws than the burglar and the confidence man; when revenue is needed they add a few links to the endless chain that now reaches nearly to the bottom of the druggist's boots. However, in the State Legislature we are getting what we pay for. You can buy whiskers, bald heads and huge equators for little money, but when you go into the market to buy brains, you will have to come loose from some coin. The average State legislator's remuneration is not as much as is paid a union bricklayer, and a plumber wouldn't sleep on the job for what is paid a solon who assumes half the responsibility for the behavior of Atlas.

A State Legislature has more views regarding the best way to save the country than a frightened cayote has notions. Colonel Songbottle, of the Rocky Creek District, is threatened with passing a bill to rescue working girls from work, and is ready to pour out eloquence, enthusiasm, blood and various and sundry flagons of "40-rod" in order that this admirable draft may become a law on our statute books. Another comes to the forum with a heart full of sympathy for the comfort and well-being of Jersey cows, and is ready to wade in blood to his eyebrows in order to put his antitick measure under the Governor's nose for his signature. There is the chap with a deep-seated hunch that every community should have its mosquito inspector and a 'steen million dollar appropriation for research work in the investigation of the diseases of humming birds. At about this juncture, Percy Pinchback screws the single barrel spectacle a little deeper into his starboard lamp and moves immediate consideration of the bone-dry bill. Percy having just regaled himself with a cup of warm tea and an order of lady fingers, feels fit as a fiddle and hard as nails, and is panting for a roughhouse with the wet element. Percy bears a strong facial resemblance to a hatchet and his idea of being real downright mean and doing something bloody blooming rough,

"donchar knaw" is to eat breakfast food for dinner. Nevertheless, in this instance he has started something that it will take fourteen weeks to stop.

Any time the bone-dry bill is mentioned, above a cathedral whisper, legitimate interests are relegated to the twilight sleep, while the wets leak tepid atmosphere, anent personal liberty, and the dries sing "Where Is My Wandering Boy Tonight." All this has such a salubrious effect on the chairman of your legislative committee. One day he stands with his foot on the brass rail and his pulley-bone on the mahogany until he is pie-eyed, and has his system fastened to a real raz-mataz Jack London jag that screams for aspirin and hollers for spirit of ammonia, appealing to the wets to support the Pharmacy Bill. They fall on his neck and say in loud, vociferous voices, "Thas all right, bo, are we with you? I should shay sho." The next day he makes a drag to get the dries to support the Pharmacy Bill. He has to drink water, discourse learnedly on the effect of alcohol on posterity, discuss elaborately and at great length the final perseverance of the saints and he delivers an oral thesis on the church *versus* the stage. The brethren are unanimously in favor of supporting the Pharmacy Bill. The chairman is much pleased, in fact he is tickled almost into convulsions, especially if he be a new man at the game. He wends his way slowly to his hotel, where he locks the door, hangs his pajamas over the transom, pulls down the blinds, disconnects the telephone in order to light a cigarette without getting caught in the act as he meditates, peering through the curls of tobacco smoke, he seems himself, down by the sea, like Alexander the Great, filling a large bandana full of briny tears because unconquered worlds are not to be had any more. He readily discerns why the fool killer passes up State capitols. It's because he doesn't want to wilfully neglect the rest of the world, and of the two jobs he chooses the lesser. Our chairman even laughs out through the armholes of his vest when he thinks of how he has put something over the State Legislature that has been hanging fire for all of these years, he views himself as a smooth manipulator of men, delivering wets and dries, tied in bundles and laid in rows. He doesn't know that a kiss of good-bye and a "God bless you" doesn't mean that the Pharmacy Bill is passed any more than it means that asafetida has lost its odor. Our hero is not allowed to gloat long over his brilliant achievement. He is called to the committee room on a bright, sunny morning, to witness the demise of the Pharmacy Bill. It is chloroformed for legislative operation, and dies on the table. As he journeys homeward he feels just like the chairman felt last session, the session before, and all other sessions at which a Pharmacy Bill was sponsored.

Infant mortality among the Pharmacy Bills in my extensive legislative practice has been nearly 100 percent. Like a Roman mother, I have stood first at the cradle and last at the grave. I have seen them born, full of hope and health. I have seen them wither and die, with a dull thud, like a campaign pledge hitting the tidal wave of prosperity, while a weak, sickly measure for the protection of stingless mosquitos grew and thrived under the blessed sunlight of committee room sanction. Semi-annually, for many years, I have stood by and wept silently as one of these legislative babies christened "Pharmacy Bill" passed to the scrap heap of broken hopes. Bill always looks the part; he has the makings of a statute, but his young life is of but a few days and full of trouble, he is strangled to death of hot air in that fatal nursery, the committee room. Your chairman may be

able to unbutton the time lock at any hour in the 24, he may know how to jimmy the latest model vault and scale the tallest porch on the boulevard, but if he ever breaks into the committee room and gets the Pharmacy Bill out, he will have established a precedent and should be pensioned for life.

There's another feature of the legislative chairman's dealings with the State Legislature that is just as pleasant to him as a bone felon on his trigger finger, and that is to have a druggist howl himself hoarse because the legislative committee didn't accomplish anything. This druggist went right on making suppositories in a very tranquil and unconcerned way while the legislative committee was sitting up nights, sweating blood and legging him to help. He shows his gratitude like a foot-pad who beats his victim unmercifully because he didn't have more money. Probably so many sins would not be laid at the door of the State Legislature if the pharmacists of this country would help the legislative committee. Owing to the presence of ladies, I am unable to express fully my views of certain State Legislatures.

CHEMICAL WARFARE SERVICE TO CONTROL GAS OPERATIONS.

The following statement is authorized by the Secretary of War:

The organization of the Chemical Warfare Service has been completed. Henceforth all phases of gas warfare will be under the control of the Chemical Warfare Service commanded by Maj. Gen. William L. Sibert.

Heretofore chemical warfare has been carried on by divisions in the Medical Department, the Ordnance Department and the Bureau of Mines. All officers and men who have been connected with offensive or defensive gas warfare here will be responsible to the Chemical Warfare Service. The field training section at present is under the Corps of Engineers.

DEFENSIVE WARFARE.

Defensive warfare has been under the control of the Medical Department. This work has consisted of the designing and manufacture of masks both for men and animals and the procurement of appliances for clearing trenches and dugouts of gas.

Offensive gas warfare consists principally of manufacturing gases and filling gas shells. The work has been under the direction of the Ordnance Department.

The new department will take over the work of chemical research for new gases and protection against known gases which has been carried on by the Bureau of Mines. All testing and experiment stations will be under the direction of the Chemical Warfare Service.

The responsibility of providing chemists for all branches of the Government and assisting in the procurement of chemists for industries essential to the success of the war and Government has been intrusted to the Chemical Warfare Service.

All chemists now in the Army will be removed from their units and placed under the authority of the Chemical Warfare Service. Newly drafted chemists will be assigned to the Chemical Warfare Service.

Authority to assign enlisted or commissioned chemists to establishments manufacturing for the Government has been granted to the new section.

A. PH. A. MEMBERSHIP PRIZES FOR MISSOURI PHARMACISTS.

Henry D. Llewellyn, of Mexico, gave two prizes of A. Ph. A. membership during his administration as president of the Missouri Pharmaceutical Association. He now offers an additional two for the year 1918-19. These prizes are open to all members of the Mo. Ph. A. In order to obtain one, it is necessary to get in on the honor list with a large number of new members for that association. Each Llewellyn prize pays one year's dues in the American Pharmaceutical Association. If the winner is not a member, he will be recommended for election. If he already belongs to the A. Ph. A., his dues will be paid by Mr. Llewellyn for one year.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

NEW YORK.

The May 1918 meeting of the New York Branch of the American Pharmaceutical Association was called to order by Acting President Turner in the Lecture Hall of the New York College of Pharmacy Building, on Monday evening, the 13th, at 8 15 o'clock. Sixty-two members were present.

The Treasurer's report was received and ordered filed.

Member of the Council: Professor Hostman brought in a brief report which was ordered accepted with the thanks of the Association.

Membership Committee: The following applications were received and the Secretary was directed to take the usual course with regard to these new members.

Morris Adoff, 546 Claremont Pkway, Bronx, N. Y.; John Paolantonio, 210 Gilbert St., Utica, N. Y.; Eugene T. O'Kane, 299 Gilbert St., Utica, N. Y.; Julius M. Pakehar, 367 S. 2nd St., Brooklyn, N. Y.; Samuel M. Goodman, 131 Spruce St., Newark, N. J.; Conrad E. Langfield, Northville, Mich.; Flower H. Reige, Tompkinsville, N. Y.; Henry C. F. Arnold, Quogue, N. Y.; Charles Shavel, 204 Columbia St., Brooklyn, N. Y.; Gerald A. Richardson, 152 Virginia Ave., Jersey City, N. J. The following from New York City: Benjamin Billig, 4003 Third Ave.; Max Bergman, 1570 Bathgate Ave.; Isaac Berniker, 1735 Washington Ave.; James Cicalello, 301 East 150th St.; George Casper Deffa, 168 E. 66th St.; Simon Doniger, 70 Sherman Ave.; Irving A. Edelstein, 1728 Crotona Park East; Bernard Eols, 2403 Watton Ave.; Isadore Flomenbaum, 1120 Vyse Ave.; Henry Frank, 2071 Vyse Ave.; Louis Friedman, 668 Teuton Ave.; Joseph Greenberg, 1047 Teller Ave.; Max M. Hager, 1484 Hoe Ave.; Miss Grace I. Harper, 10 West 101st St.; Max Heinovitch, 1078 Stebbins Ave.; Julius Kerr, 500 West 172nd St.; Joseph R. Kerr, 500 West 172nd St.; Nathan Kerr,

850 East 150th St.; Alexander Kornfield, 1005 Morris Ave.; Bruno K. Kulic, 821 Cauldwell Ave.; John D. Lore, 333 Second Ave.; David R. Mantoll, 71 East 121st St.; David Israel, 1037 Teller Ave.; Max Mathin, 2257 Second Ave.; Bernard Miller, 178 Brook Ave.; Jacob B. Moonves, 1426 Stebbins Ave.; Eugene Nagin, 290 Willis Ave.; George W. Pegg, 113 West 18th St.; Lawrence E. Pedroni, 1636 Melville St.; Oreste Petretti, 557 Fordham Road; Harvey Rabinowitz, 364 East 4th St.; Naftul Herz RaiCoy, 1525 Washington Ave.; Joseph Samsonoff, 1480 Vyse Ave.; Joseph Shapiro, 160 West 110th St.; Leo Licker; Charles Silkes, 85 Attorney St.; Abraham Solomin, 14 West 115th St.; Samuel Stein, 855 Home St.; Sidney Weinstock, 870 Freeman Street; Mendel Zagat, 850 East 150th St.; Anthony Armentano, 521 East 100th St.

Chairman Schaefer, of the Honor Roll Committee, reported that the suggestion was before the Council and would be acted upon.

Progress of Pharmacy: Dr. Diekman read abstracts on the following subjects: Sodium Fluoride, Tests for Castor Oil, Tannin in Pacific Coast Trees, Tetra Chlorethylene, Tests for Wooden Fibres, Substitution for Platinum.

After some discussion the report was ordered accepted with the thanks of the Association.

Committee on Education and Legislation: Mr. Lehman brought in a rather lengthy report, which, after some discussion, was ordered filed.

New Business: Mr. Mayo suggested that efforts be made to hold the next Convention of the A. Ph. A. in New York. The following resolution was unanimously carried.

Resolved, That the New York Branch of the American Pharmaceutical Association instruct its delegates to the Convention to invite the Parent Organization to New York for its 1919 annual meeting.

Dr. A. R. L. Dohme now took the floor and explained the details of his plan of federation of pharmaceutical bodies. Doctor Dohme was then followed by Prof. C. H. LaWall, who explained his views of the plan.

Prof. H. V. Army, Dr. H. C. Lovis, Dr. Jacob Diner, Prof. Jeannot Hostmann and Earl A. Means also took part in the program or discussed the plan.

HUGO H. SCHAEFER, *Secretary*.

COUNCIL BUSINESS

A. PH. A. COUNCIL, LETTER NO. 17.

PHILADELPHIA, PA., July 1, 1918.

To the Members of the Council:

Motion No. 26 (Election of Members; application Nos. 115 to 204, inclusive) has received a majority of affirmative votes.

Motion No. 27 (Investment in Liberty Bonds for A. Ph. A. Research Fund). Moved by J. A. Koch, seconded by H. M. Whelpley, that the Treasurer be directed to invest in Liberty Bonds, two thousand dollars or more, in addition to the ten thousand dollars already invested in such bonds, for account of the American Pharmaceutical Association Research Fund.

Motion No. 28 (Election of Members). You are requested to vote on the following applications for membership

- No. 205. Albert E. Baier, 322 So. Liberty Ave., Alliance, Ohio, rec. by F. J. Blumenschein and J. A. Koch.
- No. 206. Charles S. Johnson, care Tampa Drug Co., Tampa, Fla., rec. by M. K. Taylor and Wm. B. Day.
- No. 207. V. W. Estes, Orlando, Fla., rec. by W. G. Perry and M. M. Taylor.
- No. 208. W. M. Hankins, Daytona, Fla., rec. by W. G. Perry and M. M. Taylor.
- No. 209. N. H. Hunter, Fort Myers, Fla., rec. by W. G. Perry and M. M. Taylor.
- No. 210. Roy N. Chelf, Brooksville, Fla., rec. by D. W. Ramsaur and M. M. Taylor.
- No. 211. William Andrew Rawls, 25 S. Palafox, Pensacola, Fla., rec. by D. W. Ramsaur and M. M. Taylor.
- No. 212. Samuel S. Filer, care Fogarty & Co., Key West, Fla., rec. by Chas. Johnson and M. M. Taylor.
- No. 213. Harold Berlin Snyder, 20 Goepf St., Bethlehem, Pa. (Winner of Pharmacy Review Prize for Best Term Work in Pharmacy, Phila-

delphia College of Pharmacy), rec. by Ivor Griffith and Charles H. LaWall.

- No. 214. Henry C. F. Arnold, 173 E. 85th St., New York City, N. Y. (Winner of the J. Leon Lascoff Prize), rec. by J. Leon Lascoff and Geo. C. Dickman.
- No. 215. Anthony Armentano, 321 E. 109th St., New York, N. Y. (Winner of the J. Leon Lascoff Prize), rec. by J. Leon Lascoff and Geo. C. Dickman.
- No. 216. Gerald Arthur Richardson, 152 Virginia Ave., Jersey City, N. J., rec. by H. V. Army and Jeannot Hostmann.
- No. 217. Alvin George Florian, 2401 Cass Ave., St. Louis, Mo. (Winner of Prize awarded by the St. Louis College of Pharmacy for Excellent Scholarship), rec. by H. M. Whelpley and J. W. England.
- No. 218. Edgar Reynolds Thome, 2546 Reading Road, Cincinnati, O., rec. by H. M. Whelpley and J. C. Falk.
- No. 219. John J. Grasser, 1234 St. Andrew St., New Orleans, La., rec. by Robert F. Grace and Oscar Hurley.
- No. 220. Adley Bonisteal Nichols, 145 N. 10th St., Phila., Pa., rec. by Charles H. LaWall and J. W. Sturmer.
- No. 221. Newman Grady Hubbard, Lineville, Ala., rec. by Cicero Rudd and Wm. B. Day.
- No. 222. William John Trevaskis, P. O. Box 55, W. Memphis, Arkansas, rec. by Frank Schachleiter and Wm. B. Day.
- No. 223. Miss Helen Stauffer, Locust St., Valparaiso, Ind., rec. by Mrs. Geo. D. Timmons and Anna G. Bagley.
- No. 224. Adrian Andrew Arnaud, 417 Cherokee St., New Orleans, La., rec. by Robert F. Grace and O. B. Elmer.

- No. 225. Ruth Caroline Menger, 1500 N. 29th St., Phila., Pa., rec. by Ivor Griffith and Robert P. Fischelis.
- No. 226. Frank Hawkins, Blair, Okla. (Winner of John W. Barbour Prize in Pharmacy), rec. by H. S. Browne and Wm. B. Day.
- No. 227. Velvie Bridal, Marshall, Okla. (Winner of Howard Storm Browne Prize in Materia Medica), rec. by H. S. Browne and Wm. B. Day.
- No. 228. Max A. Zielinski, Cleveland, Ohio. (Winner of Prize for Best Student in Pharmacy, Cleveland School Pharmacy), rec. by Louis C. Hopp and Wm. B. Day.
- No. 229. George W. Wood, 6642 Michigan Ave., Chicago, Ill. (Winner of Gray Prize Membership, Univ. of Illinois, School of Pharmacy), rec. by Wm. Gray and Wm. B. Day.
- No. 230. Mrs. Neff K. Bakkers, 10900 S. Michigan Ave., Chicago, Ill. (Winner of Prize Membership, Univ. of Illinois, School of Pharmacy), rec. by Wm. B. Day and E. N. Gathercoal.
- No. 231. Milton Stein, 2223 N. Front St., Phila., Pa., rec. by C. H. LaWall and Ivor Griffith.
- No. 232. Frederick R. Pritchard, 232 Chestnut St., Kingston, Pa., rec. by Charles H. LaWall and Ivor Griffith.
- No. 233. William F. Sudro, 1117 13th St., No. Fargo, N. Dak., rec. by A. F. Schlichting and W. P. Porterfield.
- No. 234. C. W. Atkinson, Box 1521, Dallas, Texas, rec. by J. M. Fletcher and E. G. Eberle.
- No. 235. Jacob Joseph Cohan, 53 Spring St., Boston, Mass., rec. by Charles H. Hitchcock and J. W. England.
- No. 236. Daniel Henry Hills, Spring Lake Beach, N. J., rec. by Edgar R. Sparks and Hugo Kantrowitz.
- No. 237. Deane C. Bartley, 1219 W. 11th Ave., Spokane, Wash., rec. by H. M. Whelpley and F. F. Berg.
- No. 238. Mitchell Block, Excelsior Springs, Mo., rec. by Paul L. Hess and H. M. Whelpley.
- No. 239. Clarence Wierks, care Schlagel's Pharmacy, Davenport, Ia. (Winner of Scherling Prize for Excellence in Organic Chemistry, Univ. of Iowa, School of Pharmacy), rec. by G. Scherling and Wilber J. Teeters.
- No. 240. J. R. Doden, care E. Jerico, Moline, Ill. (Winner of Prize for Recognition and Description of Organic Drugs, given by W. J. Teeters, Univ. of Iowa, College of Pharmacy), rec. by Wilber J. Teeters and J. W. England.
- No. 241. Joseph Samuel Goldwag, 1081 Amsterdam Ave., New York, N. Y., rec. by William C. Anderson and Jacob H. Rehfus.
- No. 242. Daniel C. Mangan, 95 Park Ave., Brooklyn, N. Y., rec. by William C. Anderson and Jacob H. Rehfus.
- No. 243. William H. Weygandt, 170 So. 9th St., Brooklyn, N. Y., rec. by William C. Anderson and Jacob H. Rehfus.
- No. 244. Alfred Richard Johnson, Little Falls, Minn. (Winner of Prize in Chemistry given by Prof. A. H. Clark in Univ. of Illinois, School of Pharmacy), rec. by A. H. Clark and Wm. B. Day.
- No. 245. Guy Oram Tehner, 279 Greene Ave., Brooklyn, N. Y., rec. by Jos. L. Turner and Turner F. Currens.
- No. 246. Diadato Villamena, 2237-1st Ave., New York, N. Y., rec. by Hugo H. Schaefer and H. V. Army.
- No. 247. Joseph E. Hartman, 115 W. McCarty St., Indianapolis, Ind., rec. by I. E. Taylor and Wm. B. Day.

J. W. ENGLAND,

Secretary.

415 N. 33RD STREET.

A. PH. A. COUNCIL LETTER NO. 18.

PHILADELPHIA, July 1, 1918.

To the Members of the Council:

Word has been received of the demise yesterday of William Lawrence Dewoody of Pine Bluff, Arkansas, Honorary President of the American Pharmaceutical Association. He was born in Athens, Ala., on December 30, 1848.

A sketch of his life is given in the November 1917 JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

J. W. ENGLAND,

Secretary.

415 N. 33RD STREET.

COMMITTEE REPORTS

THE DRUG MARKET OF 1917.*

BY HARRY B. FRENCH.

We are repeating the opening clause of our report for the drug market in 1916. We would say that the conditions governing business in 1917 were very much the same as those in 1916, only more so. Conditions have become more complicated because of the increasing difficulty of securing shipments. It is true that freight space is obtainable for shipment from abroad, while it is practically unobtainable for shipments from this country. It is necessary, however, to obtain a license for every shipment from abroad, as well as for all goods exported from this country. Owing to the disturbed conditions in Russia, the products of that country come forward very irregularly. Shipments from the Far East are difficult to make. When the goods are obtainable, shipments can be made from Italy, France and England, in vessels arriving in those countries with full cargoes from the United States.

The increasing demand in all countries for Government requirements and the increasing demand upon man-power, increases the difficulty of cultivating and gathering crude drugs. In a number of important items, the Government demands are so large that it practically absorbs the whole product. Many of these products are now licensed. In the case, for instance, of Acetic Acid, it is impossible to obtain this acid for resale, although moderate supplies can be obtained for use in manufacturing medicinal products.

The difficulties confronting distributors are becoming increasingly difficult. A very large proportion of their employees are of the floating variety and among these, we are sorry to say, there is a very insufficient sense of personal responsibility. Employers accept applicants without asking for references and almost without asking for qualifications and hesitate to discharge them even for serious causes. The distributor, therefore, is faced with the problem of greatly increased distribution with decreased efficiency in his working force. The cost of doing business has enormously increased and is still increasing. This is made up not only of the increased cost of labor but of everything that enters into business transactions—rates for money are very much higher, the cost of packing boxes, barrels, twine, excelsior, cartage and other numerous items that enter into that of doing business has been greatly increased. Conditions are such that it is not so much now a matter of price as of being able to furnish the goods and of packing them and shipping them. It must be, moreover, borne in mind that the price of a very considerable portion of the goods distributed by wholesale druggists is fixed and the profit has not increased with the increased cost of doing business. It is the opinion of the writer that the increased cost of doing business during the present year will be found to have a more important bearing on profits than in any previous year of the war; this will be found to be an increasingly important factor, if this terrible war is prolonged. It is certain that no wholesale house in the United States is making such profits as would class it among those who are designated as "profiteers."

It is very important that retail druggists should realize these conditions, which also to a large extent directly affect them, so that they may make allowances for the difficulties encountered by the wholesale druggists in filling their orders; and also that they may realize and bear in mind the necessity of charging a profit on the goods that they sell and for the service they render. The dealer who fails to recognize these conditions to charge a larger profit for services and for goods is liable to suffer heavy pecuniary losses, which he may not realize until he closes his account at the end of the year.

Referring to particular articles, we would call your attention to the following:

Acetanilid and Acetphenetidin, through the increased production in this country, have been greatly reduced in price.

* From Report of Committee on Trade Interests, B. E. Pritchard, *Chairman*, presented to the Pennsylvania Pharmaceutical Association, meeting at Wilkes-Barre, June 1918.

Benzoic Acid.—The Government now strictly limits the quantity of Toluol that can be used and therefore the products of Benzoic Acid will be limited. The price, however, is today very much lower than a year ago. We think it will probably not again reach the figure of \$10 to \$12 per lb., unless under pressure of temporary necessity.

Citric Acid has advanced considerably and there has been talk of limitations of importations of Citrate of Lime, but the manufacturers in this country seem to have caught up with the demand and will supply the legitimate trade at reasonable prices.

Acid Salicylic and Sodium Salicylate are being produced in larger quantities and sufficient to meet demands.

Acid Tartaric has very largely advanced and it is not liable that lower prices will be seen.

Agar Agar, or Japanese isinglass, is being used in new ways and is much higher in price, owing to the increased cost of importation and because of its larger demand.

Agaric is unobtainable.

Albumen—apparently egg albumen—is being used for new purposes, as it has largely advanced and is very scarce.

Alcohol, Ethyl, is selling on the basis of \$5.25 in barrels.

Alcohol, Wood, has been taken under Government control and is selling for \$1.15 per gallon in barrels.

Aloin.—The demand is extremely large and the price has advanced correspondingly.

Some of the chief articles of import, like Calumba Root, Areca Nuts, and Kola Nuts, are becoming scarcer and may possibly disappear from the market because of difficulties of obtaining freight room for cheap products.

Arrowroot is extremely scarce, St. Vincent advancing from about 6 c. to 40 c. lb. in barrels.

Arsenic has been taken under Government control. At one time the price was as high as 25 c. lb. in kegs, but is now about 16 c. lb.

Balsam Copaiba remains about 95 c. lb.

Balsam Tolu has become extremely scarce.

Bark, Calisaya was for a time almost unobtainable but supplies are now larger.

Bark, Cascara Sagrada, is about double in price. The output this year is held for high prices.

All American crude drugs will be very much higher.

Bay Rum is selling for about \$4.00 per gallon.

Camphor advanced to \$1.20 lb. for ounces in pound packages in 100-lb. cases. The Japanese not only control the supplies of crude camphor but apparently are trying to freeze out American manufacturers.

Cantharides, Russian, are in only moderate supply.

Cloves, Zanzibar, in a small way, 65–70 c. lb.

Cocaine, muriate, is constantly advancing. The manufacturers have announced another advance of \$1.00 oz., June 12.

Cochineal is almost unobtainable and only at very high prices.

Cacao Butter is showing a firmer tendency.

Opium and its products are somewhat lower, as supplies have been more abundant.

Mercurials are all firm at the prevailing previous high prices.

Coumarin is selling as high as \$32.00 lb. This is partially due to a strike that took place in the establishment of the largest production.

Cream of Tartar and Tartaric Acid are both very high and firm in price.

Cutch.—The Government has taken over the control of this article and will sell only under certain specifications.

Cuttlefishbone, in a small way, 60–65 c. lb. Supplies are small.

Ergot is getting very scarce. It is quoted in a small way at \$1.25 lb.

The tendency towards higher prices is more strongly evidenced in Crude Drugs, while there are conflicting currents affecting the prices of Chemicals.

Gelatin is not manufactured in the summer and for several months we expect small supplies and higher prices.

Glycerin.—There are two different opinions prevailing to-day as to the future course of glycerin—some think it may go down and some that it may go up. The predominating opinion is that it will advance.

Aloes—All kinds are in small supply and very high in price.

Gum Arabic is selling at about two and one-half times the usual price.

Asafetida is extremely high in price, in a small way \$2.50 lb.

Gum Tragacanth No. 1, white, ribbon, in a small way, \$3.00 lb.

Harlem Oil, domestic, of superior quality, may now be obtained at reasonable prices.

Honey, California, is selling at about four hundred percent over the usual price.

Insect Powder, pure, is in reasonable supply and is obtainable in kegs at 40 c. lb.

Leaves, Belladonna, of excellent quality, are very largely grown in this country. Prices are lower and the situation is very much better.

Leaves, Buchu, are in small supply and the scarcity is apt to continue.

Leaves, Henbane, are in larger supply.

Licorice Root and *Licorice Extract* are in small supply. It is hoped that later the extreme shortage may be relieved by shipments from Spain.

Lycopodium is a Russian product that is in good supply at present.

Magnesium Carbonate is getting scarcer and prices are advancing.

Menthol is firming up, but it must be remembered that Germany, who was one of the largest buyers, is no longer a customer.

Essential Oils are all strong.

Oil, Castor, is worth \$4.00 per gal. in 5-gal. cans. Immense quantities of the finest grade of castor oil are required for aeroplanes.

Oil, Cod Liver, will remain high. The Newfoundland variety has practically entirely taken the place of the Norwegian. The price is \$1.10 per gallon in barrels.

Olive Oil is almost unobtainable; in a small way, in 1-gal. cans, the asking price is \$7.80 per gallon for the first quality of table oil.

Oil, Sassafras, true, is in very small supply and will continue so for several months. The price to-day in a small way is about \$2.50.

Quinine Sulphate is obtainable for small supplies. We are informed that reasonable supplies of bark are coming forward, but it is certain that the present high prices will continue and may be advanced. The American manufacturers' price is 75 c. oz. in 100-oz. tins. Outside holders are getting \$1.20 per ounce.

Roots.—Some of the roots are unobtainable and many of them are very scarce.

Root, Rhubarb, has advanced from 20 c. to 65 c. lb. in case lots.

Root, Senega, in bales, is worth \$1.10 lb.

Saffron, Spanish, \$18.00 lb.

Seeds.—Many seeds also are in small supply and very firm in price.

Seed, Canary, in bags 17 c. lb.

Seed, Celery, 42 c. lb.

Seed, Colchicum, \$4.00 lb.

Seed, Fennel, large, German, almost out of the market, \$1.10 lb.

Seed, Flax, in bbls., 11 c. lb.

Seed, Foenugreek, ground, in barrels, 17 c. lb.

Seed, Quince, in a small way, \$1.50 lb.

Seed, Sunflower, domestic, in a small way, 10 to 12 c. lb.

Soap, Castile, Conti's, out of the market.

Sugar, Milk, in barrels, 55 c. lb.

Tur, Barbadoes, unobtainable.

Notwithstanding the high prices, it is a matter of great importance that all dealers should carry in stock a reasonable supply of crude drugs and other products for which there is a steady demand. Those who have the courage and the foresight to do this will find that they can charge a price that will bring them in a reasonable profit.

AMERICAN PHARMACEUTICAL ASSOCIATION

Organized: Philadelphia, 1852.

Incorporated: Washington, D. C., 1888.

OFFICIAL ROSTER FOR 1917-1918.

GENERAL OFFICERS.

tion.

EDITORIAL NOTES

Editor: E. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

QUININE AND WARBURG'S TINCTURE IN MALARIA.

Complex formulas of medicinal preparations are oftentimes criticized for the chief reason, that they contain a number of constituents. Frequently the criticism is justified, but certainly not always, for after all in the practice of medicine, as Doctor Robinson has tersely stated: Science, so-called and merely temporary, must give way to experience, based upon long and careful bedside observation of the wise practitioner.

Replying to a communication of Dr. H. Rabinowitch, published in the *Medical Record* of June 8, 1918, Beverly Robinson, M.D., of New York, writes in a succeeding issue of the same publication: "Of course, I am familiar with the fact that Warburg's tincture contains a proportion of quinine. Nor do I doubt that some of its remedial effects are due to the presence of this alkaloid. On the other hand, I also know and affirm again that in not a few instances quinine in similar or much larger quantity is wholly inadequate to effect a cure of malaria. Warburg's tincture in these instances effects the cure. Why, I cannot precisely say, nor can anyone else. It contains numerous drugs, and among them there may be some that are inert. It still remains true that the multiple combination does what nothing else known up to the present time effects in some most obstinate and imminently threatening cases. That we know, as shown by repeated proofs and the published records of some of the best clinicians of former days.

"*Ars longa, vita brevis*. The greatest rôle of the physician is to cure and to relieve symptoms. Science, so-called and merely temporary, must give way to experience, based upon long and careful bedside observation of the wise practitioner. Only a few days ago the distinguished Surgeon-General of our Army insisted in an address before the University and Bellevue Hospital Medical College upon the great value of the all-round doctor with our army at the front

as compared with the specialist whose importance has a relatively limited field of work in time of greatest stress. I wish, particularly, at the present time, to insist that useful knowledge of our great forebears in medicine shall not be practically ignored. For this reason I wrote a strong word for Warburg's tincture in the treatment of malaria. In more than one of our latest and best works on the practice of medicine it is scarcely referred to."

OIL CHENOPODIUM.

Oil of chenopodium is an unusually valuable anthelmintic, and it is employed quite extensively in the treatment of hookworm disease.

An investigation, on the composition of the oil and the anthelmintic value of some of its components, by Maurice C. Hall and Herbert C. Hamilton, is reported in *The Journal of Pharmacology and Experimental Therapeutics* for April 1918, pp. 231-261. Reference is made to Schimmel and Company's *Semi-Annual Report*, April 1908, wherein it is stated that ascaridol (which apparently corresponds to the heavier fraction of oil of chenopodium) is the part responsible for the therapeutic activity of the drug, a statement which has generally been accepted. The authors' conclusions, from their extended experiments are, that the lighter portion of the oil is more anthelmintic and much less irritating. They make the further statement that, if clinical data confirm their experiments, the use of the refined product would be distinctly indicated, notwithstanding such expense. The experiments would prove that the gastro-intestinal irritation induced by administration of the oil is due to that portion remaining after distillation at temperatures below 125° C. with a pressure equal to 30 mm. of mercury, or at equivalent temperatures and pressures.

W. H. Ziegler contributed an article on oil of chenopodium to the *Interstate Medical Journal*, October 1917, wherein he reports that the absorption of the oil is more rapid

from the stomach than from the intestines, and the absorption is delayed when the oil is administered in salol-coated capsules. He also states that atropine antagonizes the depressant effect upon the respiration; the cause of death in the dog when the oil is administered in toxic doses is an acute diffused nephritis; small doses are non-toxic and the toxicity is not influenced by the age of the animal. This author's findings are that the oil of the market does not greatly vary in potency and cites as the principal causes for fatal effects, the failure of the practitioner to differentiate between drops and minims, and of not following therapeutic doses with a purge, either of magnesium sulphate or castor oil.

A PHARMACEUTICAL CHEMIST KNIGHTED.

Peter Wyatt Squire, chemist on the establishment of the English Royal Household, has had the dignity of Knighthood conferred upon him. The preferment has not only value

SIR PETER WYATT SQUIRE.

because conferred for merit, but also because it is a signal honor to pharmacy. The honored pharmacist is well and favorably known through his works and contributions to the English pharmaceutical press. Since the outbreak of the war, among other special pharmaceutical war service, one of the most important has been the production by him, in collaboration with Sir Douglas Powell, of the

foot ointment used with so much success for the prevention of frost-bite in the trenches.

Sir Peter Wyatt Squire was a student and prize-winner in the British Pharmaceutical Society School in 1864. He served as member of the Council of the Society from 1879-1885. He read a paper on the standardization of drugs before the International Congress of Chemistry in 1909. His work best known to American pharmacists is "Squire's Companion to the Pharmacopoeia," inaugurated by his father, the later Peter Squire, president of the British Pharmaceutical Society, 1861-1863.

W. L. CURRIE.

New President, Pharmaceutical Society, Great Britain.

JAPAN HONORS A PHARMACIST.

M. Hata, Japanese pharmacist, formerly president of the Army Sanitary Material Warehouse, has been created a major-general, at the head of the Japanese Army sanitary department. Until recently pharmacy has been neglected in Japan, but now in recognizing the value of pharmacy, the country has shown her progressiveness. Dr. Jokichi Takamine, member of the A. Ph. A., at present in Japan, has communicated this information, evidently, because it gave him great pleasure to do so.

MACHINE GUN COMPANY WILL BE MADE UP OF GRADUATES IN PHARMACY.

A machine gun company that has enough money to buy its own guns and own uniforms

is being organized. When formed it will be turned over as a complete unit to the 22nd Engineers, New York Guard.

Already the regiment has a company made up of journalists and advertising experts under command of Capt. F. A. Adams.

E. C. Martindale, Ph.G., doing technical work at Roosevelt Hospital, and a sergeant major of the 3rd Battalion, 22nd Engineers, is recruiting for this ultra-pharmaceutical company. He states \$3,200 has been donated by members for machine guns and \$1,000 more for uniforms. Other companies in the 22nd are equipped and recruited at the expense of the State.

Members have been secured from the working forces of the following firms: Parke, Davis & Co., Sharp & Dohme, Caswell, Massey Co., E. R. Squibb & Sons, Frederick Stearns & Co., L. K. Liggett Co., A. Boujouis Perfumery Co., Nyal Co., Walter John Fraser, Harriman Laboratory, Roosevelt Hospital, Certified Products Co., and Ricksecker & Weigand.—*N. Y. Commercial*.

ENDOWING CHEMICAL RESEARCH.

The du Ponts have established thirty-three scholarships and eighteen fellowships in chemistry in various colleges and universities. This action complements and supplements the large number of chemists who are employed daily in the laboratories of the various duPont plants and engaged in research. If the example thus set will be followed by others of the large chemical industries the colleges will be benefited, and, in turn, the industries will be protected at their most vital points, that is, in those matters where applied expertness counts and mere mechanical output is at a discount.

In a degree the suggestion is applicable to pharmaceutical enterprises, there is opportunity for research in colleges of pharmacy along various lines, but most of them are not endowed sufficiently to greatly extend this necessary work, unless aided.

AMERICAN SURGEONS ISOLATE TRENCH FEVER GERM.

The United States Medical Corps, under the leadership of Surgeon-General William Gorgas, has succeeded in isolating the germ of trench fever.

The success of the American tests, reported in a cablegram from General Pershing to Secretary of War Baker, was made possible by the voluntary sacrifice of sixty-six American

soldiers—all members of noncombatant units of a New England division—who submitted to inoculation with the germ in January. General Pershing's message says all of the men now are either cured or convalescent. These men were from field hospitals and ambulance organizations.

PHARMACISTS BRAVE DEATH.

In a recent news item pharmacists were not specifically named in the headlines but the paragraphs spoke of their courage. The occurrence was during a violent attack when the bandages ran low. Harry W. Jarvis, U. S. N., Philadelphia, chief pharmacists' mate, in response to the Surgeon's call, "we must have bandages," volunteered to make a trip to the rear; he made the trip and returned with the bandages.

German prisoners were carrying in wounded and the intensity of the enemy shrapnel fire was such that three of them were killed at the doorway of the dressing station. Captain Orlando S. Petty, of Philadelphia, an assistant surgeon, was operating in a ditch on the opposite side of the road which was lit up by the flashes from exploding shells.

Finally the surgical dressings caught fire and, unable to work any longer, the doctors were compelled to evacuate the place under a deluge of high explosive shells. Lee J. McDaniel, Newport, R. I., Frank O. Tibbetts, Dorchester, Mass., and Claude Mattingly, Santa Rosa, Calif., pharmacists' mates, and Roy J. Israel, hospital apprentice, Allentown, Pa., were assisting the surgeons. Twenty wounded Americans and thirty wounded Germans were lying at the roadside at the time. The men named removed the entire fifty, carrying them to the nearest point to which the ambulances could come.

The next day McDaniel, who seemed to bear a charmed life, and Marion L. Turner, Pharmacist's mate, Milwaukee, Wis., made five trips through the barrage to reach wounded, bandage the men and bring them out.

George A. Jones, hospital attendant, Brooklyn, N. Y., gave a courageous example of faithfulness, dressing the wounds of his fallen comrades while under machine gun fire. When exhausted he made his way back to the regimental hospital unassisted, refusing aid until all the others had been cared for. Algernon G. Brumlee, pharmacist's mate, Spray, N. C., located a machine gun sniper's pit by offering himself as a target.

Unwounded he returned, signalled the position and had the satisfaction of seeing the first shell send the gun and crew into the sky in the shape of fragments.

Members of the Sixty-fifth sanitary section of the United States army were cited for courage in action recently in a communique signed by Divisional General Targe, commander of the 121st Infantry Division.

"In the heavy battles taking place at the present moment," says the statement, "the American personnel of the S. S. U. 65 has commanded, as in the past, the admiration of the officers and soldiers of the 121st Division."

"Always ready to go forward to the zones most intensely under enemy fire, the Americans expose themselves voluntarily to rescue and bring back our wounded. Worthy sons of their great country, they show the initiative, the audacity, the calm courage of their race."

"In the name of their brothers of the French army, the general commanding the division thanks them and congratulates them."

WOMEN CHEMISTS NEEDED.

The Committee on Public Information, Division on Women's War Work, issues the following:

Women chemists are needed by the Government and also to stabilize the industries by replacing men chemists who have been called into service, according to Capt. Frederick E. Breithut, of the Chemical Service Section of the National Army. This call is so urgent that he has asked the women's committee of the Council of National Defense to cooperate with the Army Medical Department in making a census of all the available women chemists in the country.

ENOUGH DENTISTS NOW IN ARMY TO CARE FOR 5 MILLION MEN.

The following statement is authorized by the War Department from the office of the Surgeon General:

The dental requirements of an Army of more than 5,000,000 men can now be met by the present force of the Dental Corps of the American Army. Examinations for dental officers have been closed and no further additions will be made to the corps for at least six months.

LIBERTY LOAN INTEREST RATES.

Secretary McAdoo officially corrects a statement appearing in various newspapers that the Fourth Liberty Loan will bear interest at the rate of $4\frac{1}{2}$ percent. He states that no thought has been entertained of issuing the bonds of the fourth loan at a higher rate than $4\frac{1}{4}$ percent.

It is interesting to recall here the Secretary's appeal in his Third Liberty Loan speeches that the rate of interest for Government loans be stabilized at $4\frac{1}{4}$ percent. He said then that as an intelligent people we should make a stand for the financing of our Government during the period of the war at a stabilized rate of interest, naming $4\frac{1}{4}$ percent as the proper figure, so that all business and investments might be adjusted on that basis. In his letter to Majority Leader Kitchin he strongly urges stabilizing the rate at $4\frac{1}{4}$ percent.

The Secretary of the Treasury has also asserted he did not think that the patriotism of the American people was measured by the rate of interest on a Government bond, and the support the people gave the Third Liberty Loan seems to have justified his belief.

LARD SUBSTITUTE.

An Oregon chemist has completed experiments with hydrogenation of fish oil, which according to reports is acceptable to the U. S. Food Administration. The subject of suitable bases for ointments is an interesting one for pharmacists.

Dr. J. N. Rose of the National Museum of the Smithsonian Institute and a party of other scientists will investigate the opportunities for obtaining cinchona bark in Ecuador, and also other drugs and dye-woods.

Government officials believe that this expedition will be the first of a series into all the South American countries to develop commercial plant possibilities to replace certain products on which the United States has heretofore been dependent upon Germany.

Henry Kendall Mulford of Philadelphia has been honored with the degree of Master of Science by Lafayette College, Easton, Pa. Prof. Edward Hart presented Mr. Mulford to the President of the College. The former referred to Mr. Mulford as one who has led his profession in the field of preventive medicine. "It has been truly said," the speaker

continued, "that the good physician is the great benefactor. How much more a benefactor the man whose work guides and extends the activities of the good physician."

Henry K. Mulford, Jr., has returned from France on a short leave of absence. He has been in the Red Cross Service "Over There."

Clyde L. Eddy, managing editor of the *Druggists Circular* since January 1917 has

enlisted in the Army and will go with the Signal Corps as news Photographer. He is now pursuing a preparatory course of study in the U. S. School of Military Cinematography. Mr. Eddy graduated from the California College of Pharmacy in 1912 and was editor of the *Pacific Pharmacist* before engaging with the first named publication. Mr. Eddy has for several years participated actively in A. Ph. A. work.

OBITUARY.

WILLIAM LAWRENCE DEWOODY.

At the Indianapolis meeting of the American Pharmaceutical Association W. L. Dewoody of Pine Bluff, Ark., was elected honorary president. In accepting of the honor Mr. Dewoody said in substance: "I desire that the members understand that my expression of thanks for the honor conferred comes from the heart. I appreciate the privilege of being associated with a body of men whose efforts are for the elevation of pharmacy. My heart has always been with you socially and professionally. I could ask for no greater honor than this and I feel that it is an expression from the hearts of the members of this Association, as a testimonial of my sincerity. I will try to keep the title an honorable one."

Faithful until death, Mr. Dewoody passed away Sunday, June 30, 1918, aged 70 years. The Association sorrows with the bereaved widow and family and extends sympathy in their loss. It is a striking incident that Mrs. W. L. Dewoody, Mrs. Alfred Husted and Mrs. Charles Holzhauer should have constituted the Resolutions Committee of the Women's Section at the Indianapolis meeting.

"While it is a great joy to meet and renew old friendships, it deepens our sorrow and regret that any should be missing," they said.

And these words supply the writer with an expression, for it has been his privilege to associate with the deceased and their good life companions for many years and each year the friendship seemed stronger because we knew each other better. "To the past go more dead faces, Every year; as the loved leave vacant places, Every year;"—

The brief sketch of Mr. Dewoody in the November issue, 1917, of the *JOURNAL*, was closed with these lines: "His face is turned to the sunset and he rests secure in the love,

esteem and confidence of the community at large."

W. L. DEWOODY.

Honorary President A. Ph. A., 1917-1918.

Mr. Dewoody was born in Athens, Ala., December 30, 1848 and came to Pine Bluff, Ark., May 12, 1870, and here he thereafter resided, not only making a success in business affairs but actively interested in the duties of a good citizen. The deceased joined the American Pharmaceutical Association in 1887 and very infrequently missed a meeting thereafter.

Mrs. Dewoody, who usually accompanied her husband to the annual A. Ph. A. meetings, and eight children survive the deceased.

JOHN HARPER LONG.

John Harper Long, professor of chemistry at the Northwestern University died at his home in Evanston, Ill., June 14, after an illness of over six months. Professor Long was born near Stenbenville, Ohio, in December 1856. He was graduated from the University of Kansas in 1877, and later studied at Tübingen, Germany, receiving the degree of doctor of science in 1879. He was appointed professor of chemistry in the medical school of Northwestern University in 1881. Professor Long was a member of the referee board of consulting scientific experts of the United States Department of Agriculture.

J. H. LONG.

He was a chemist of the state board of health and of the sanitary district of Chicago. He served as president of the American Chemical Society in 1903, of the American Association for the Advancement of Science in 1903 and of the Institute of Medicine of Chicago in 1917. Professor Long was a member of the United States Pharmacopoeia Revision Committee, and from the time of its organization until his death a member of the Council on Pharmacy and Chemistry. He was a member of the American Pharmaceutical Association from 1915-17. During 1913-17 he was dean of the school of pharmacy of Northwestern University.

Professor Long did much chemical research work, particularly in the branches of physiologic chemistry closely related to medicine. As a member of the Council on Pharmacy and Chemistry he not only gave much

time to the routine work, but in addition carried out many original investigations.

Professor Long leaves, besides his widow, Catherine S. Long, four sons—Albert, Esmond, Lothar, Captain, United States Marine Corps in France, and Byron, Lieutenant, United States Army—and one daughter, Ariel, wife of Lieut. E. P. Miller of Washington, D. C.

GEORGE LEIS

The life of George Leis was a most eventful one, coming to Kansas in the pioneer days, the family settled in Lawrence when it was a settlement of sod houses, dugouts and tents.

GEORGE LEIS

One of the founders, University of Kansas, and of the Department of Pharmacy.

He was born in New York City February 18, 1842; in 1854 his parents emigrated to Kansas. The father died two years later and it devolved on the son to assist in the support of his mother and family. These were troublesome times in Kansas, due to raiders and it became necessary for the settlers to defend themselves and rid the country of the undesirables. In this work Mr. Leis participated and when a few years later the war broke out he answered the country's call to service.

During the years from 1857-62 he had clerked in the drug store of Woodward and Finley and studied medicine under Doctors Fuller and Miner. Returning to Lawrence, after the close of the war, he engaged in the

drug business and this small beginning developed into large proportions and was later incorporated as the Leis Chemical Co.

Mr. Leis was active in many of the enterprises of Lawrence, especially those which had for their object the promotion of the business, educational and social welfare of the city and State. He was a heavy contributor to the first university building and in 1887 he was influential in establishing a Chair of Pharmacy in the State University.

The *Lawrence Journal World* in the opening paragraphs of the sketch relating to the deceased says: "George Leis died Saturday, May 25. He was one of the most prominent business men of Lawrence. His passing away is an event in the history not only of the city of Lawrence but of the state of Kansas, for

his whole life was devoted to the building up of the state.

"George Leis was one of the clear visioned pioneers who saw and worked for the future prosperity of Kansas even while he endured the trials of the early days—trials such as this part of the country will never again know. He lived through the early day famines caused by drought and pests, the destructive raids of the Border Ruffian war and Civil war and the financial crises that brought ruin to so many of the old business men."

Mr. Leis is survived by his wife, Lillian R. Leis, and six children, Kathryn Leis Davies, Zoe Leis, Edmund R. Leis, George K. Leis, Tracy F. Leis and S. Frank Leis.

The deceased joined the American Pharmaceutical Association in 1869.

SOCIETIES AND COLLEGES.

THE CHICAGO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Chairmen of the different Sections of the A. Ph. A. report progress but at this writing are not ready to submit programs. The list of Section officers was printed in the June issue of the *JOURNAL*, page 569, and will be convenient for those who have papers in preparation.

Chairman C. B. Jordan reports the following papers for the Section on Education and Legislation:

"Is Research Work along Lines Suggested by the Last Revision of the U. S. P. Possible and Practical in Schools of Pharmacy?"—C. S. Chase.

"What is the Meaning of a Degree in Pharmacy?"—L. E. Sayre.

"Coöperation between State Medical and Pharmaceutical Boards. Joint Control over the Preparation, Distribution, Purity Sales of Drugs."—F. E. Stewart.

"Is the Exclusive Ownership and Use of Coined Names for Chemicals, Drugs, and Their Preparations Objectionable and Should It Be Subject to Limitations and Restrictions?"—F. E. Stewart.

"What Should Be the Attitude of the Profession toward Further Restriction in the Sale and Use of Alcohol?"—Herbert W. Emerson.

"Publication of Potent Drug Content in All Ready-Made Medicine. Is it Desirable?"—Oscar Dowling.

"Instruction of Pharmacists for War."—Caswell A. Mayo.

"Health Insurance Legislation."—J. H. Beal.

"Plant Chemistry."—Nellie Wakeman.

Secretary Hugo Kantrowitz reports that Edward Kremers, William B. Day, F. W. Nitardy, Frederick J. Wulling and W. W. Figgis have promised papers. And also the acceptance of the following:

"The Etymological Derivations of the Word 'Drug.'"—W. O. Richtman.

"The History of Arsenical Preparations."—H. A. Langenhan.

Reports indicate a very good attendance for the Chicago meeting.

AMERICAN MEDICAL ASSOCIATION MEETING.

The sixty-ninth annual meeting of the American Medical Association was held in Chicago during the week of June 10. Certainly this meeting was the most important convention ever held by any organization in this country. It would be idle attempt to even briefly summarize the transactions; however, we reproduce the closing paragraph of a retrospect in the *Journal of the A. M. A.*:

"The attendance at this session was the largest since the Chicago session of 1908. The total, 5,553, is but a meager 800 less than that of the 1908 session, and when one takes into consideration the fact that about 20,000 physicians are in active military service, that the services of many physicians are con-

tinuously needed by civilian communities and industrial institutions, and that railroad rates are comparatively higher than they have ever before been in the history of our country, the attendance at this session may well be said to have been phenomenal. No meeting of the Association has so successfully reached the public as did this sixty-ninth annual session, and the public showed its interest in the session and in the work which the medical profession is trying to accomplish, by attending in large numbers every meeting in which arrangements had been made for it."

MAJOR ALEXANDER LAMBERT, M. R. C.,
U. S. ARMY.

President-elect of the American Medical Association.

The Committee on Scientific Research has been reestablished and as newly constituted consists of: Dr. Ludvig Hektoen, Professor of Pathology at Rush Medical College, Chicago; Dr. G. N. Stewart, Professor of Experimental Medicine, Western Reserve University, Cleveland; Dr. A. W. Hewlett, Professor of Medicine, Leland Stanford Jr. University, Berkeley, Calif.; Col. F. F. Russell, Surgeon General's Office, Washington, D. C.; J. W. Churchman, Professor of Surgery, Yale University, New Haven, Conn.; and Herbert Charles Moffit, Dean and Professor of Medicine, University of California Medical School.

NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION ELECTS OFFICERS.

The June meeting of the National Pharmaceutical Service Association, which was also the annual meeting of that body, was held at the Philadelphia College of Pharmacy, June 11th.

The chief features of the meeting were the reports of the officers. President Beringer reviewed the efforts of the Association in the drafting of the Edmonds Bill and having it introduced, and made a plea for greater coöperation on the part of pharmaceutical bodies generally, in making the movement for the Pharmaceutical Corps a success.

Secretary Robt. P. Fischelis reviewed the propaganda work that had been carried on during the year and announced that the membership now totaled about 1400. He earnestly requested the Association to relieve him from the duties of the secretaryship because of pressure of business and other association work.

All of the officers were given a vote of thanks for their efforts during the year and the following were elected to serve for the term of 1918-19:

President, George M. Beringer; *Vice-President*, Charles H. LaWall; *Secretary*, E. Fullerton Cook; *Treasurer*, Josiah C. Peacock; *Executive Committee*, Joseph W. England, Philadelphia; C. A. Mayo, New York; Eugene G. Eberle, Philadelphia; Samuel C. Henry, Chicago; Louis Werner, Cincinnati; Ambrose Hunsberger, Philadelphia; Robert P. Fischelis, Philadelphia; F. E. Stewart, Philadelphia; William D. Robinson, Philadelphia.

Communications regarding the work of the Association and applications for membership should be addressed to Prof. E. Fullerton Cook, Secretary, at 145 North Tenth Street, Philadelphia.

STATE PHARMACEUTICAL ASSOCIATION MEETINGS.

The State Associations so far convened report larger attendances than expected. This is highly gratifying and proves an awakening interest, for it must be admitted that the item of help seriously interferes with vacation days for proprietors. The associations have endorsed the Edmonds Bill and also passed favorable resolutions, and now contemplate a campaign among citizens in behalf of such

provision in the U. S. Army. Legislative matters and tax measures were freely discussed, and there is no doubt relative to the opportunities afforded. The plans for federating the drug industries received attention in nearly all of these organizations. A general conference to discuss the plans will be held in Chicago, August 10.

STATE PHARMACEUTICAL ASSOCIATION.

OFFICERS FOR 1918-1919.

ILLINOIS.

President, Frank J. Dubsy, Chicago.

First Vice-President, John C. Wheatcroft, Grayville.

Second Vice-President, W. J. Clancy, LaSalle.

Third Vice-President, Ad Umenhofer, Chicago.

Secretary, W. B. Day, Chicago.

Treasurer, Chris Garver, Bloomington.

Peoria was selected for the next place of meeting, June 17-20, 1919.

KENTUCKY.

President, R. S. Berrymann, Versailles.

First Vice-President, W. J. Wilson, Mayfield.

Second Vice-President, Charles Laudier, Ashland.

Third Vice-President, T. J. Brockman, Fredonia.

Secretary, J. W. Gayle, Frankfort.

Treasurer, Vernon Driskell, Carrollton.

Place for next meeting not selected.

KANSAS.

President, W. E. Sheriff, Ellsworth.

Vice-President, J. A. Searcy, Leavenworth.

Secretary, D. F. Deem, Stark.

Treasurer, John Schmitter, Gypsum.

MARYLAND.

President, W. H. Clarke, Pocomoke City.

First Vice-President, D. R. Millard, Baltimore.

Second Vice-President, G. E. Pearse, Frostburg.

Third Vice-President, R. E. L. Williamson, Baltimore.

Secretary, E. F. Kelly, Baltimore.

Treasurer, Samuel Y. Harris, Baltimore.

Executive Committee, C. C. Neal, Baltimore; E. W. Hodson, Baltimore; G. A. Bunting, Baltimore; C. R. Holtzman, Cumberland; H. W. Eakle, Hagerstown.

MISSOURI.

President, Minnie M. Whitney, Kansas City.

First Vice-President, A. C. Smith, Carrollton.

Second Vice-President, C. H. McDonald, Rocky Comfort.

Third Vice-President, W. R. Scheldrup, Pierce City.

Secretary, H. M. Whelpley, St. Louis.

Treasurer, Wm. Mittelbach, Boonville.

Assistant Secretary, C. E. Zinn, Kansas City.

Council, H. D. Llewellyn.

Chairman, A. M. Howard.

Vice-Chairman, D. V. Whitney.

Secretary, Otto F. Claus, St. Louis; W. E. Bard, Sedalia.

NEBRASKA.

President, J. Earle Harper, Spencer.

First Vice-President, Tresa St. Martin, Wahoo.

Second Vice-President, J. W. Bushnell.

Third Vice-President, Miss Elsie Day, Lincoln.

Fourth Vice-President, A. E. Carlson, Dannebrog.

Fifth Vice-President, Neil Dodge, Hickman.

Secretary, J. G. McBride, University Place.

Treasurer, D. D. Adams, Nehawko.

NORTH CAROLINA.

President, S. E. Welfare, Winston-Salem.

Vice-Presidents, G. R. Pilkington, Pittsboro; E. E. Missildine, Tryon; I. W. Rose, Rocky Mount.

Secretary-Treasurer, J. G. Beard, Chapel Hill.

Member Board of Pharmacy, F. W. Hancock, Oxford.

Local Secretary, R. R. Bellamy, Wilmington.

Wilmington was selected as the next meeting place.

OFFICERS NATIONAL DRUG CLERKS ASSOCIATION 1918-1919.

President, Henry J. Steining, Lafayette, Ind.

First Vice-President, Frederick J. Killalee, St. Louis, Mo.

Second Vice-President, James K. Wunsch, Chicago, Ill.

Third Vice-President, Marvin E. Pate, Madisonville, Ky.

Secretary-Treasurer, P. A. Mandabach, Chicago, Ill.

Councilor-at-Law, R. A. Cavanagh, Chicago, Ill.

Consulting Attorney, Cline C. Brosius, Chicago, Ill.

Corresponding attorneys in every state of the Union. Paul J. Mandabach, National Editor and Director of Publicity.

THE PHARMACIST AND THE LAW.

WAR EXCISE TAXES.

Attention is called to the following articles because they may be overlooked in rendering taxes.

ART. XIX. *Medicinal preparations*.—The tax is 2 percent of the price for which pills, tablets, powders, tinctures, troches or lozenges, sirups, medicinal cordials or bitters, anodynes, tonics, plasters, liniments, salves, ointments, pastes, drops, waters, essences, spirits, oils, and all medicinal preparations, compounds or compositions whatsoever, are sold by the manufacturer; provided that

(1) The manufacturer claims to have any private formula, secret or occult art for making or preparing them; or

(2) The manufacturer has or claims to have any exclusive right or title to making or preparing them; or

(3) They are prepared, uttered, vended, or exposed for sale under any letters patent or trade-mark; or

(4) They are held out or recommended to the public by the makers, venders, or proprietors thereof, either (a) as proprietary medicines or medicinal proprietary articles or preparations, or (b) as remedies or specifics for any disease or affection whatever affecting the human or animal body.

ART. XX. *Medicinal preparations: Scope of tax*.—Every medicinal preparation, compound, or composition which is embraced within one or more of subdivisions (1), (2), (3) and (4) in the preceding article is subject to the tax. If, for instance, an article is made or prepared by a manufacturer claiming to have a private formula, secret or occult art for it, it is taxable, even though it is not prepared, uttered, vended, or exposed for sale under any letters patent or trade-mark, and it is not held out or recommended to the public as a proprietary medicine or medicinal proprietary article or preparation or as a remedy or specific for any disease or affection of the human or animal body. Preparations made in accordance with formulas contained in the United States Pharmacopoeia and National Formulary by pharmaceutical manufacturers, when not held out or recommended as proprietary medicines or medicinal proprietary articles or preparations, or as remedies or specifics, are not subject to the tax; but if so held out or recommended they are taxable, although not identified by any name, trade-mark, or otherwise.

ART. XXI. *Medicinal preparations: Who is a "manufacturer?"*—Within the meaning of this subdivision a manufacturer or producer is a person who prepares an article or has it prepared and sells it, and who identifies the article by a commercial name, trade-mark, or trade name, or by other means, or holds out or recommends the article as a proprietary medicine or medicinal proprietary article or preparation, or as a remedy or specific. If the article or its container has on it both a trade-mark or trade name of one manufacturer and the individual or business name of another, the owner of the trade-mark or trade name will be deemed the manufacturer. If the article or its container has on it both the commercial name of the article and an individual or business name, the latter will be deemed to designate the manufacturer. A person who is employed to make an article and receives for it the cost of materials and labor, plus a specified profit, shall be considered a manufacturing agent, and the person who procures the preparation of the article will be considered the manufacturer. Where the owner of a formula contracts with a manufacturer to prepare an article according to such formula and to deliver it to him in complete, salable form, the labels bearing the formula owner's name, he is considered the manufacturer. A person who bottles or otherwise prepares an article, and merely for advertising purposes places on such article the name of any dealer who may handle it, shall be deemed the manufacturer if the names of both persons appear, but if only the dealer's name appears he shall be deemed the manufacturer. "Held out or recommended" includes representation by any means, personal canvas and statements on the labels, in pamphlets and in advertisements, or otherwise. A holding out or recommendation intended for physicians only is a holding out to the public.

ART. XXII. *Medicinal preparations: Articles included*.—The word "medicinal" is applicable to any substance adapted to cure or alleviate disease or pain. Accordingly, a medicinal preparation is a preparation of any substance whatever intended to be applied for the cure or mitigation of pain or disease. Many articles or substances which are not usually considered as belonging to materia medica may become taxable medicinal preparations by being held out or advertised as remedies for diseases affecting the human or

animal body. Boric acid when sold under a trade-mark as a medicinal preparation is taxable.

ART. XXVI. *Return of tax on commodities.*
—Each manufacturer of any of the articles hereinabove enumerated must make monthly returns under oath in duplicate and pay the taxes imposed on such articles to the collector of internal revenue for the district in which his principal place of business is located. The returns shall be made on Form 728. Instructions for preparing will be found on the back of the form. The returns are to be rendered and the tax paid on or before the last day of each month covering the transactions of the preceding month, the first return

to cover all transactions since October 3, 1917. Where articles are sold over a period of time under an agreement for a quantity rebate, the tax, if originally computed on the gross price, may be adjusted in the return for the month in which the price is finally determined. Branch houses should in general make reports to the parent house, which is liable to make monthly returns of the sales of the branch house. An itinerant manufacturer should make return and pay the tax to the collector of the district where the sales are made. The books of every person liable to the tax shall be open at all times for inspection by examining internal revenue officers.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGES OF ADDRESS SINCE APRIL 23, 1918.

TWOMBLY, A. P. W.

From 721 Huntington Ave., Boston, Mass.

To Box 94, N. Rochester, New Hampshire.

McGOGY, J. F.

From 6219 12th Ave., N. E., Seattle, Washington.

To 1015 E. 55th St., Seattle, Washington.

GROSS, E. O.

From Albia, Iowa, care G. D. Miller.

To Elma, Iowa.

KING, G. A. N.

From Twin City Drug Mills, Minneapolis, Minnesota.

To 2631 Emerson South, Minneapolis, Minnesota.

MERNER, P. M. P.

From Cedar Falls, Iowa.

To 89 Auburn Ave., Sierra Madre, Cal.

BOTKIN, R. J.

From Residence unknown.

To 138 W. 31st, Bayonne, New Jersey.

BERGER, E. R.

From Residence unknown.

To Odebolt, Iowa.

ELLIOTT, C. S.

From Residence unknown.

To Base Hospital, Camp Grant, Rockford, Illinois.

BRACONIER, F. G.

From 1145 Main St., Campello, Massachusetts.

To U. S. S. Wilhelmina, Brooklyn, New York.

MOORE, M. S.

From 308 W. Chestnut St., Albion, Michigan.

To 320 W. Lapeer St., Lansing, Michigan.

UNITED STATES PUBLIC HEALTH SERVICE.

List of Changes of Duties and Stations of Commissioned and Other Officers of the United States Public Health Service for the days ended June 12, 1918.

Pharmacist J. A. Wolfe. Relieved at the Marine Hospital, Stapleton, New York. Proceeded to Washington, D. C., for temporary duty. June 1, 1918.

Sanitary Engr. H. R. Crohurst. Proceeded to Wichita Falls, Texas, for conference regarding water supply at the Aviation Camp. June 3, 1918.

Sanitary Engr. H. W. Streeter. Proceeded to Portsmouth, N. H., for consideration of plans for securing a safe water supply for that city. June 1, 1918.

Prof. C. W. Stiles. Proceeded to necessary points in the State of Georgia for conference

regarding venereal disease control. May 20, 1918.

Pharmacist F. L. Brown. Proceeded to Baltimore Quarantine Station for temporary duty. On completion of duty rejoined station at Philadelphia, Pa. May 29, 1918.

Pharmacologist Julius Stieglitz. Proceeded to New York and Philadelphia via Washington, for investigation of methods of manufacturing arsphenamine. May 23, 1918.

Pharmacist T. V. O'Gorman. Relieved at Marine Hospital, Port Townsend, Wash. Report at Quarantine Station for duty. June 4, 1918.

Bacteriologist Nathan Berman. Proceeded to Chattanooga, Tenn., for duty in connection with sanitation of extra-cantonment areas. June 7, 1918.

Bacteriologist E. D. Reynolds. Relieved at Macon, Ga. Proceed to Greenville, S. C., on special temporary duty. June 11, 1918.

Scientific Asst. W. H. Price. Proceed to Little Rock, Ark., on temporary duty. June 10, 1918.

Sanitary Inspector E. J. McLaughlin. Relieved at Petersburg, Va. Proceed to Englewood, N. J., on special temporary duty. June 11, 1918.

Sanitary Inspector W. F. Purrington. Relieved at Spartanburg, S. C. Proceed to Portsmouth, N. H., on special temporary duty. June 11, 1918.

PROMOTIONS.

Pharmacist John H. Hayes. Promoted and appointed a Pharmacist of the Second Class, effective March 18, 1918. May 23, 1918.

BOOK NOTICES AND REVIEWS.

Annual Reports of the Chemical Laboratory of the American Medical Association for 1917. Paper. Price, postpaid, 25 cents. Pp. 140. Chicago: American Medical Association, 1918.

This, the tenth volume of the Reports of the A. M. A. Chemical Laboratory, presents the portions of the Laboratory's work carried out during 1917 which it was thought would be of interest to those concerned with the analysis of drugs. Like the preceding volumes it gives not only the results of the examination of many proprietary preparations but also the methods of analysis employed. The latter feature makes the publication most helpful to drug analysts, pharmacists and others interested in pharmaceutical chemistry.

The following is a list of the subjects treated: Note on the Determination of Boric Acid by Titration in the Presence of Glycerol; Some Color Reactions Obtained from the Extract of *Acer Spicatum* (False *Viburnum Opulus*, *Viburnum Opulus* U. S. P. VIII); Wheeler's Tissue Phosphates; "Ambrine" and Paraffin Films; The Stability of Iodine Ointments; The J. B. L. Cascade Treatment; Brom-I-Phos; Low's Worm Syrup; Dr. Pierce's Anuric Tablets; Zirato; "Haines Golden Treatment;" Venosal; Surgodine; Commercial Pelletierine Tannate; "Byron Barber's Pneumonia Specific;" Standards for Beta-naphthyl Benzoate; Elixir Novo-Rexamine (Upsher Smith); "Freeze-Proof;" Dr. Hand's Worm Elixir for Children; Iodeol and Iodagol; Iodolene and the Solubility of Iodin in Liquid Petrolatum; Kar-Ru; Magnesium Acid Citrate—"Citrsia;" Mineral Salts and Stuart's Calcium Wafer Compound.

This volume very appropriately also contains a collective index to the ten volumes so far issued. The index gives not only the titles of the many preparations and compounds examined since the organization of the Laboratory but also a key to the methods of determining the constituents of the prepara-

tions analyzed. Thus, a reference in the index states how boric acid was determined in the following preparations: Alcola, Berledets, Collyrium Wyeth, Crystos, Kora-Konia, Micajah's Uterine Wafers, Mrs. Price's Caning Compound, O-Do-Cure, Oxychlorine and Zyme-Oid. This feature should be of much help to analysts called on to examine complex drug preparations.

PUBLICATIONS RECEIVED.

The Supplement to the United States Naval Medical Bulletin, April 1918, published for the information of The Hospital Corps of the Navy.—Issued by The Bureau of Medicine and Surgery, Navy Department. Division of Publications, Medical Inspector J. S. Taylor, United States Navy, in charge. Edited by Past Assistant Surgeon G. F. Cottle, United States Navy.

Sixteenth Annual Report of the Board of Pharmacy of the State of New Jersey.—October 31, 1917.

Directory of Registered Pharmacists and Registered Assistant Pharmacists of the State of New Jersey.—Also containing the Pharmacy Law of the State and the Rules of the Board for its Enforcement. Issued September 1917, by the New Jersey Board of Pharmacy.

In Memoriam, Prof. Joseph Price Remington, being a reprint from the *American Journal of Pharmacy*, February 1918. The booklet is neatly printed and the frontispiece exceptionally good, and of a photograph that presents a speaking likeness of this honored pharmacist as he appeared among us several years ago.

University Bulletin University of Michigan.—*College of Pharmacy Bulletin* of the Philadelphia—College of Pharmacy and Alumni report.

Supplement to Bulletin Buffalo College of Pharmacy.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley, but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be typewritten and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

| SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE. | | | | | | |
|----------------------------------------------------|-------|-------|--------|--------|---------|--|
| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. | |
| 50..... | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 | |
| 100..... | 1.76 | 3.52 | 5.28 | 7.04 | 1.54 | |
| 150..... | 1.98 | 3.96 | 5.94 | 7.92 | 1.82 | |
| 200..... | 2.20 | 4.40 | 6.60 | 8.80 | 2.09 | |

Orders may be sent to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1917-1918.

President—Charles Holzhauser,* Newark, N. J.

Acting President—Alfred R. L. Dohme, Baltimore, Md.

Honorary President—W. L. Dewoody,† Pine Bluff, Ark.

Second Vice-President—Leonard A. Seltzer, 32 Adams St., W. Detroit, Mich.

Third Vice-President—Theodore J. Bradley, 70 St. Botolph St., Boston, Mass.

General Secretary—William B. Day, 701 So. Wood St., Chicago, Ill.

Treasurer—Henry M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Reporter on the Progress of Pharmacy—H. V. Arny, 115 West 68th St., New York, N. Y.

Editor of the Journal—E. G. Eberle, 253 Bourse Bldg., Philadelphia, Pa.

Local Secretary—E. N. Gathercoal, 701 So. Wood St., Chicago, Ill.

Chairman of the Council—Lewis C. Hopp, 1104 Euclid Ave., Cleveland, Ohio.

Secretary of the Council—J. W. England, 415 North Thirty-third St., Philadelphia, Pa.

* Deceased November 19, 1917.

† Deceased June 30, 1918.

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

AUGUST, 1918

NO. 8

CLARENCE O. BIGELOW.

Despite his varied activities—financial, educational and commercial—Clarence O. Bigelow is primarily a retail pharmacist. Recently, it was the privilege of his friends to honor him on the occasion of the fiftieth anniversary of his entrance into retail pharmacy. It is now almost forty years since he purchased the drug store that he has conducted with such great success ever since. Honors, civic and social, have been thrust upon him; financial reward has come to him in goodly measure, and yet, with opportunities for other avocations, his real vocation is the conducting of a high grade pharmacy, that is neither ultra-professional nor crassly commercial.

Mr. Bigelow is a native of Phenix, R. I. but he obtained his early education and his first year of drug store experience in Springfield, Mass. In 1867, he sought his fortune in New York, securing a position with G. L. Hooper. In 1870, he attended the New York College of Pharmacy, became a registered pharmacist and ten years later purchased the business founded in 1838 by Dr. Galen Hunter. This business, he has conducted with marked success. Down in the old Washington Square district, he has inspired the confidence of the choicest residents of that aristocratic quarter. He now occupies a handsome building of his own and employs a staff of over thirty persons.

As is true of all really successful men, Mr. Bigelow has found time for outside activities. He is a member of a number of clubs; he is the president of the West Side Savings Bank and has been one of its trustees for over twenty-five years; he has been a member of the American Pharmaceutical Association since 1900 and was president of its New York branch during 1912-13. He has been a member of the New York State Pharmaceutical Association since 1898 and was a member of the committee that compiled the present edition of the National Pharmaceutical Syllabus.

But Mr. Bigelow's greatest service to Pharmacy has come from his work on the New York Board of Pharmacy and as treasurer of the New York College of Pharmacy. For fifteen years, he gave his splendid administrative talents first to the New York City Board and then, upon its organization to the all-State board. In the first critical years of that great body, he gave it the benefit of his ripe judgment and of his executive experience. His work for the New York College cannot be told in a brief sketch. He has given it his time, his thought and his aid. He has guided it as treasurer through many difficulties. He has so husbanded its finances, that it is now in a more flourishing condition than ever before in its history.

H. V. ARNY.

EDITORIAL

E. G. EBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

THE CHICAGO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

THE Sixty-Sixth annual meeting of the American Pharmaceutical Association is being held in Chicago this week, hence it is impossible to report on the transactions. The address of President A. R. L. Dohme, however, is printed in this number of the JOURNAL, but prior to the report of the Committee on the President's address and the action of the Association thereon. His views, comments and recommendations are therefore to be considered with the forthcoming report and action of the Association relative thereto. The minutes will be printed in the succeeding issue of the JOURNAL.

The various Sections provided excellent programs; many of the papers were prompted by the conditions brought about by the war, thus, the Scientific Section had among quite a number of other important contributions an illustrated lecture on "The Effects of War on Drug Cultivation;" a series of papers on the problems confronting the chemical and pharmaceutical manufacturers on account of the war conditions, and how these affect the retail pharmacists. The Women's Section arranged for a lecture on conservation. The program of the Section on Education and Legislation was outlined in the July issue; several papers on educational subjects were added. Both the Section on Practical Pharmacy and on Commercial Interests had exceedingly interesting programs and evidenced the careful study of the officers to make the sessions instructive and valuable for the retail pharmacists; in fact, the purposes of all the Sections were kept in mind and seldom have the papers better indicated the coöperative interrelation of all the work of the Association in the interest of pharmacists. The contributions of the Section on Historical Pharmacy not only recorded past events but applied the lessons for the present and future. So this much may be said, the work of this convention clearly evidenced that the American Pharmaceutical Association fully comprehends its mission for pharmacy and pharmacists and the reports and papers should convince all pharmacists and persuade them to affiliate and coöperate. As a result of the work done in Chicago the succeeding numbers of the JOURNAL will have value far in excess of the annual membership fee in the Association for every pharmacist.

E. G. E.

ADDRESS OF THE PRESIDENT OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.*

A. R. L. DOHME.

Fellow Members of the American Pharmaceutical Association:

For the first time in the history of this association your duly elected and installed president has not presided at your next annual meeting and for the first time in consequence your duly elected First Vice-President has assumed the mantle and responsibilities of that high and important office. I know how much you all loved Charles Holzhauser, whose untimely death has made it possible for me to be addressing you from this chair. I need not attempt to portray the many endearing sterling noble qualities nor the unfailing high principles which enabled him to make such a great success of his chosen calling—pharmacy—for you knew him as well as I did. He was well worthy of the great honor you bestowed upon him in electing him your president for he loved the American Pharmaceutical Association as he loved his own child and he was fully as faithful to the one as he has shown himself to be to the other.

What a blessing it was, friends, that you did him the honor to elect him and thus enable him to fulfil one of his highest if not his highest ambition—president of the A. Ph. A.—before his death. Little did I dream when my good friend, John B. Thomas, nominated me to be your vice-president that I should ever have the honor and the privilege of appearing before you as your president. There is one thing I have found out after the death of President Holzhauser and that

A. R. L. DOHME

pharmacy. Several other past presidents have in a general way voiced the same sentiment. What more natural inference can be drawn than that I should as the representative of your duly elected president endeavor to carry out the ideas and purposes for the betterment of pharmacy that were uppermost in his mind. Especially is this true if entirely independent of what anyone else may have thought upon the subject, I had come to the conclusion that all other subjects or topics affecting the A. Ph. A. were secondary in importance and would later follow as a consequence to a federation of all pharmaceutical associations and interests in one large powerful efficient centrally and permanently managed association. But I will come back to this paramount subject later.

We meet here to-day in the great metropolis of the west—Chicago—growing so rapidly and extensively and progressing so thoroughly and amazingly that one can hardly recognize it between visits. To congratulate Chicago is like

was that the great subject he hoped to try to realize and accomplish during his term of office was federated pharmacy. The vision so beautifully drawn and so splendidly presented by his predecessor in office, Dean Wulling, had made a deep impression upon his mind and heart. He felt as a good practical successful man that it was the fundamental problem to be solved for pharmacy if pharmacy hoped to better her condition and his beloved A. Ph. A. come into her own as the dear old Alma Mater of all American

* Presented at First General Session of the Sixty-Sixth Annual Convention of the American Pharmaceutical Association, Chicago, Ill., August 13, 1918.

trying to paint the lily—wholly superfluous and as surely ineffectual because Chicago is congratulating herself daily by daily achieving great accomplishments and advances. This Association has met here twice before in its history, once in 1869 under the presidency of Edward Parrish and again in 1893 at the time of the Great Columbian Exposition under the presidency of Joseph P. Remington. It almost seems necessary when we meet in this center of energy and progressiveness that we must do something momentous in our own history and so it seems destined to be. Federation may have been conceived and heralded elsewhere but it is apparently the general hope and wish that it shall be born on the shores of Lake Michigan.

This is neither the time nor the place, nor am I the one, to criticize our association or any of its methods or activities. I am glad to be able to state that all of your officers, committees, editor, chairmen of committees and all connected with your Association have done all they could be expected to do and have accomplished all they could be expected to accomplish under the conditions and limitations imposed upon them by a divided pharmacy and a limited treasury resulting from almost a minimum of membership. Even if I wished to criticize any one, any branch of our organization, any method we employ in our work I could not conscientiously do it, because every one has done his full duty by our Association and deserves well of it at your hands. The trouble which confronts us and which prevents our doing what our Association should and could accomplish is not to be laid at the door of any officer, committee or other agency of the Association. It is the inevitable result of the system and conditions under which pharmacy and its many agents exist in this country. Can the A. Ph. A., I submit, do any real service for its 50,000 votaries in this country with a membership of 2700? Does its "say so," its voice represent any strength or any power when it arises from only about five percent of its representatives? Was there ever a time and can you possibly conceive of a condition when 5 percent could sway 95 percent or even presume to voice their sentiments? Every president since the very early years of the 66 years old A. Ph. A. has appealed seriously and loudly for an increased membership and many of them have devised plans and some of them carried out plans for enlarging our membership, realizing that the income derived from 2700 members will not enable the Association to give *quid pro quo* to its members for membership dues. All progress from our present and past status and influence and power, must, as I see it, depend upon our merging our interests with the interests of all other national and state pharmaceutical associations, all of which are more or less in the same standstill position as we are, and from the time this occurs and this great achievement of federation is an accomplished fact, will our real ability to give more than a full *quid pro quo* be made possible. Why not then cease trying to temporize or busy ourselves with minor changes or details of organization and management and concentrate our efforts upon accomplishing federation of pharmacy? It has hence seemed to me, after a great deal of study of our Association's history and its present condition and its probable future under present conditions, that I must, if I am true to myself and wish to live up to my convictions, throw all my thought, energy and soul into a concentrated effort to make federation of pharmacy a reality and a living thing. To this end I named a committee upon federated pharmacy as called for by the resolutions resulting from the report of the committee upon President Wulling's annual address at Indianapolis, of which my dear friend, Prof. H. V. Arny, is chairman and from whom you will hear much of interest during the course of this meeting. However, before giving you my reasons for reaching this conclusion and my ideas of how it may be accomplished, permit me to pass in review a few other questions pertaining to pharmacy that have come to my attention during the past year.

PHARMACY CORPS IN THE ARMY.

It has been the aim of this Association for many years to secure recognition

for the pharmacists in the government service as you all know. Formerly in times of peace this was desirable but not essential. Its desirability then was based upon the fact that our profession, which we appreciate is the left hand of medicine if we may call the diagnosis of disease and the prescribing of the necessary medicine the right hand, was not recognized as worthy of any rank in the government service whereas its sister profession of medicine stood at the very top of rank in that service, the surgeon-general of the army holding the rank of major-general. Certainly if the right hand is worthy of the high rank of major-general the left hand of the healing of the sick is worthy of the rank of a captain or a lieutenant. Practically all the leading countries of the world realize and appreciate this and grant some recognition and consequent rank to their pharmacists in their government service.

But now when we are engaged in the most terrible and destructive and extensive war of all times and millions of our men are exposed to disease and injury and the left hand is almost as much needed daily as the right hand and the man who wields the left hand should have some standing and rank and consequent self-respect over and above just a kitchen-detective, a harrier or a hostler. Our army as at present constituted has a medical corps, a veterinary corps, a dental corps, an ambulance corps, a sanitary corps and a chemical division but no pharmacy corps. In order to get some idea of what was the nature of the pharmaceutical service in the army, our committee on the status of pharmacy in the army and navy sent out questionnaires to the several camps and cantonments in this country. How deplorable this service is the report of that committee through its chairman, Mr. Hilton, will make plain to you. It is practically no service in pharmacy at all that our boys who are giving their lives and their health for their country are receiving. A bill to give the country the needed pharmaceutical service and enable the pharmacist, who has had a college course and graduated in pharmacy, to occupy a position of self-respect and rank somewhat commensurate with the education and importance in the work of healing the sick was introduced by a pharmacist, Mr. Edmonds of Pennsylvania; and a hearing was had before the House Military Committee on that bill, and the room was crowded with representative members of the profession and of this association. All to no avail—for the surgeon-general, Dr. Gorgas, is opposed to a Pharmacy Corps in the army and until he undergoes a change of heart we were practically told it is useless to attempt to pass such a bill. All efforts to convince him or to change his view have been futile. His position is that present method and service are sufficient to handle the situation. When we consider that our Continental Army in 1776 recognized pharmacists and gave them rank, it seems that something must have gone wrong in the progress of pharmacy when a century and a half later we find ourselves less thought of in the government service than were the wielders of the mortars and pestles of Revolutionary days.

While we have allowed nothing to prevent our working as hard and earnestly as we could to secure recognition for pharmacy and while we believe the American Medical Association has not opposed recognition of pharmacy in the government service, if we can judge by their comments in their official journals, yet we have been unable to accomplish our purpose at this critical juncture in our country's history despite the fact that our object is the laudable and patriotic one of helping to give our soldiers the efficient service they undoubtedly need and need badly. Now there is a reason for this—there must be a distinct and radical reason why we cannot win recognition by our government. Doubtless many of you have your own idea of what this reason is. I know I have, and I am going to give it to you. Lack of united spirit and action of pharmaceutical bodies, *i. e.*, lack of federated pharmacy and a united front and spirit. There are too many viewpoints at variance with one another in our ten national pharmaceutical associations now existent and too much self-interest and jealous-mindedness among and between them. I can testify to this from my own experience since studying and corresponding upon this great question of federation.

THE FUNDS OF THE A. PH. A.

In studying these funds I have been convinced of their utopian rather than utilitarian purpose and effect. We have ten such funds whose aggregate principal sum as of January 1, 1918, amounted to \$67,831.47. These funds are:

| | |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|
| 1 Life membership fund (interest from which is available for association expenses but has not been so used and is merely accumulating interest)..... | \$22,644.60 |
| 2 Centennial Fund (interest from which is available for defraying expenses of any member for a research work undertaken by him, very seldom availed of and mainly used in accumulating interest)..... | 3,057.68 |
| 3 Endowment Fund (not available until it reaches \$25,000 when half of its interest income is available, hence of no use for many years to come, possibly for our grandchildren)..... | 6,864.30 |
| 4 General Fund (no known object or purpose stated, merely capital invested and at a very low rate of interest)..... | 10,000.00 |
| 5 A. Ph. A. Research Fund (not available until it reaches the sum of \$100,000, when its interest becomes available. This will probably require about 20 years to become available)..... | 11,102.55 |
| 6 Ebert Legacy Fund (not available until it reaches \$10,000 when interest becomes available. This will require about 25 years and hence does not interest this generation)..... | 4,324.47 |
| 7 Ebert Prize Fund (interest available annually for prizes, otherwise interest added to principal)..... | 1,133.27 |
| 8 Procter Monument Fund (to construct a monument to Wm. Procter, Jr., which monument should have been erected some time ago)..... | 8,486.20 |
| 9 Rice Memorial Fund (no purpose, merely a remnant with a distinguished name attached)..... | 178.40 |
| 10 Motter Fund (this was an experiment that failed and should be consolidated with the Rice Memorial Fund)..... | 40.00 |

A study of these funds induces me to offer a suggestion regarding them. Only two or three of them, the Centennial Ebert and Procter Funds, have specific purposes and can be and are at times used for an intended purpose. Apparently all the rest are either mementos or provisions for the future bearing interest and be it said very small interest but serving practically no useful purpose. Those that are invested in bonds, except those invested this year in Liberty Bonds for patriotic purposes, might be better invested, for they return the minimum of interest. I would suggest that at the proper time they be reinvested in securities that are safe but yield a better interest return. As to the disposition of these funds I feel that it is high time they be taken in hand and be made to serve some real purpose to our Association other than earning savings bank interest. My suggestion for their use is based upon my belief in the adoption of federated pharmacy and in that connection I would use such of these funds as could by action of the Association be made available as to their principal sum to furnish and equip the proposed central offices and laboratories, etc., and make them available for the use of all the members of the federated association to be formed. They would then serve a very practical and useful purpose to all members, and when we have a successful federated association we will have enough income to supply all the needs for our expenses and will not then have occasion to provide for future contingencies, as is the case now with these funds.

PRESENTATION OF PAPERS AT SECTION MEETINGS.

It has been my experience and observation during the 27 years I have been a member of this Association that the average member in attendance upon our meetings has too much listening to do and too little opportunity to speak his mind. This is the result of our custom of having papers read in full by their

authors. My suggestion is that papers presented to sections be required whenever possible to be presented in abstract and not to occupy more than ten minutes for their presentation. This can be done by stating the purpose to be accomplished and the thought that led up to this, the method or arguments adduced to accomplish it and finally the actual results or conclusions reached. Then have the author or chairman open the discussion and endeavor to have as many members present participate in the discussion. By this means members will become more interested in the meetings and the proceedings will prove more interesting.

U. S. P. REVISION.

Since our last meeting the chairman of the Revision Committee, also one of our ex-presidents, Prof. Joseph Price Remington, has passed to the great beyond and the committee has elected his successor, Prof. Charles H. LaWall, our president-elect. These are important days for pharmacopoeia revision since so many of our drugs and chemicals formerly secured from abroad are now either not available at all or are being made in this country and hence require modification in regard to alternatives or standards. Our committee on U. S. P. revision should carefully consider this and make such recommendations as seem to them advisable.

HOUSE OF DELEGATES.

I feel that our state associations are in need of coöperation and harmonizing for various reasons. As a basis for improving the grade and quality of our future pharmacists, an uniform and generally adopted prerequisite law providing that only graduated pharmacists shall be licensed to practice pharmacy should be adopted by every state in this country. This can best and easiest be accomplished by either forming an association of state pharmaceutical associations or by making the present House of Delegates of the A. Ph. A. a state association body and thus accomplish the prerequisite uniformity and universality in the House of Delegates. In matters of legislation and state laws, in pure food and drug matters, narcotics, formula exposure, etc., etc., the action of all state associations in harmony and coöperation in the House of Delegates would be of service and value to all pharmacists if in no other way than by securing uniformity of constructive legislation and by practical enforcement of laws. An association of state associations has been suggested as a means of bringing this about and in the event that federation were accomplished and the House of Delegates became the main body of the federated association, then the organization thus affected could become a separate association with representation in the federated body similar to other national pharmaceutical associations.

IN MEMORIAM.

The year 1917-1918 has been unusually severe upon pharmacy in the loss of her influential men. First we lost our former general secretary of so many years, Charles Caspari, Jr., a man who was not only most representative of high ideals and broad views in pharmacy but who was perhaps the most unselfish representative of pharmacy in our ranks. Always doing things for some one else, never thinking of himself. What a wonderful memory to leave behind in the hearts of his friends! A wonderfully well posted man and a generally beloved man. When he said a thing or expounded an opinion it was sure to be just about one hundred percent correct. His services to this association can hardly be estimated or appraised for they cover so many branches of our work. Not only pharmacy but the world was a loser when the light of Charles Caspari, Jr. went out. I knew him well almost from the day I was born, for he was a clerk in my father's drug store and later I was an apprentice in his pharmacy. His were the admonishments of a man who, being permeated with a genuine love for his profession, instilled that love into all who came under his influence in any way. It was a privilege to be a pupil of Charles Caspari, Jr., and an asset worth much to its possessor through life. It will be many a day before we shall see his like again.

Charles Holzhauer realized the ambition and hope of his life when you honored him by electing him president of this Association and it is a genuine grief to me that he could not have lived until this day to stand here instead of myself to tell you what his many successful years of active life in pharmacy had enabled him to absorb for his and your benefit. He will go down into pharmaceutical history as a man who spent all his life in the practice of his chosen profession and beginning with nothing but determination, high ideals, sterling honesty and right dealing and living made a striking success of his life and his business. His life and career should be used as an example of what a young man can accomplish if he consistently carries out the highest principles of honesty and industriousness, persistence and high ideals. Would there more Charles Holzhauers in pharmacy to-day!

Joseph Price Remington—the hub around which the wheel of pharmacy has rolled for a generation. The man who received the torch of pharmacy from Parrish and Procter, first lighted by them in this country as a living profession and science, and who carried it successfully and ennobled it during almost fifty years. The man whose smile was the quintessence of optimism and who probably has taught more young men pharmacy than any other man in the history of pharmacy. The man who also carried the torch of American pharmacy out among the nations and made it known and respected. The man who took the great responsibility of editing the United States Pharmacopoeia from the hands of that remarkable genius, Charles Rice, and so maintained the high standard set by Doctor Rice that it has become to-day one of the great books of pharmacy in the world.

All three of these men represent milestones and oases on the high road of pharmaceutical progress and their loss all in one year will for a long time be felt by pharmacy. May I request that, due to their great prominence in their profession and the place in our hearts that has been made vacant by their death, we all rise in our seats as a tribute of love and respect to their memory.

Remington Honor Medal.—The New York Branch has, with consent of this Association, created a fund which will enable it to present annually a medal, in memory of Prof. Remington, to that person who has in the previous year done most to advance further pharmacy and the ex-presidents of this Association are to be the committee to award it.

Société de Chimie Industrielle.—A new association, the French Society of Chemical Industry, has been formed during the past year and sent greetings and a tender of exchange of journals to this association. It is one of the many instances of the rise of a new development as the result of this terrible war now devastating the earth. Like our own marvellous development of chemical industry in this country since the outbreak of the war, it has stepped into being to supply the need once supplied by the German Chemical Industry and, like ours, it will doubtless largely replace it after the war is over. It was my great pleasure and privilege to convey to this new association the greetings and good wishes for success of this Association.

PHARMACEUTICAL EDUCATION.

In order that pharmacy may attain to a position somewhat more approximate to medicine in influence and position than has been the case during the past quarter of a century several things seem necessary.

First: That the number of pharmacies and pharmacists be reduced and that the quality of both be raised. This would result in more pharmacies with better incomes for each and less corner drug stores and apothecary shops.

Second: That a prerequisite law be passed in every state in the United States, so that only graduated pharmacists be granted the license by the state to practice their profession in that state.

Third: That the entrance requirements to all schools of pharmacy in this country be made more rigid so that a recognized state high school diploma be made mandatory by all such schools of pharmacy for matriculation into them.

Fourth: That the courses of study leading to a degree in pharmacy be increased in number and extent, so that the degree will cover more than the usual subjects of chemistry, pharmacy and botany but include besides microscopy, pharmacognosy, materia medica and practical pharmacy and dispensing, also courses in ethics, psychology, physics, biology, geology, political economy, modern languages, advertising, accounting and merchandizing, so that the course will require at least three and preferably four years and when completed will be worthy of the degree of Doctor of Pharmacy and be commensurate with that of doctor of medicine, doctor of divinity, etc.

Fifth: That two degrees be offered by schools of pharmacy for a limited period after the inauguration of these changes in the curriculum of schools of pharmacy: one Ph.D. or graduate in pharmacy, granted after completion of a two years' course as heretofore and the other Ph.D. or doctor of pharmacy granted after completion of a three or four years' course as above outlined. After ten years, however, only the degree of Ph.D. be granted covering the completion of the full three or four years' course from October to June.

FEDERATION OF PHARMACY.

Having touched upon these several subjects, it now becomes my duty to bring before you my message and the real story I have to tell. In studying the history of this Association, I find that it was conceived in 1852 in a tolerant spirit of broad-minded consideration for the success and welfare of all branches of pharmacy. It was from its birth intended to be true to its name and be in fact the American Pharmaceutical Association—an association so broad and comprehensive as to include every branch and department of pharmacy in America. Both its sister associations, the American Medical Association and the American Chemical Society, have as you observe the same broad comprehensive names. At our meetings the teacher, retailer, manufacturer, wholesaler, broker, clerk, salesman-representative, editor, publisher, etc., etc., have always been welcome as members and have been accorded every opportunity to have their say and be heard. Without going into the details of our subsequent history or into that of our just mentioned sister associations, suffice it to say at this time that the A. Ph. A. finds itself to-day, after sixty-six years of sterling vigorous life devoted to the welfare and advancement of pharmacy in all its branches, in the unfortunate and unenviable position of having only 2700 members out of about 50,000 pharmacists in this country as compared with about 65,000 members of the A. M. A. out of about 150,000 physicians and 10,000 members of the American Chemical Society out of about 18,000 chemists in the country. Practically every president of this Association has, I find, dwelt at some length upon the importance of increasing our membership, and one of them wrote personally thousands of letters in an effort to personally accomplish this. All, however, to no purpose, for although new members are secured every year and one of our enthusiastic and devoted members even gets practically the whole graduating class of his college to join the A. Ph. A., yet the newly added members only about offset the losses by death, resignation and dropping for non-payment of dues during the year. This is a fundamental weakness of the A. Ph. A. and there must be a reason for it. No association can keep alive and efficient and progress if it does not secure and hold more than five percent of its available members. To my mind the reason is lucidly clear. The American Medical Association and the American Chemical Society secure and hold members in great number because they give an equivalent in real value and service to their members in return for the membership fee. All of you know that the journal alone of each of these two sister societies, without considering the real support, protection and service given their members in various ways, is more than an equivalent for their membership fee. Medical men highly esteem the journal of the A. M. A. and chemists could not do their work properly without the *Journal of Industrial and Engineering Chemistry* and the *Journal of the American Chemical Society*. Hence they join without much effort to secure them as members and they remain members when once they have joined the association. Comparisons are always odious and I hence refrain from a statement as to what our members secure in

return for their membership. I appreciate fully that our journal could not be better edited, and our Year Book is a valuable book for many members. Let me confine my remarks upon the two publications to these two statements: we have not enough income and means to make the journal better than it is and we have not enough circulation to make it a popular advertising medium to produce revenue; and our Year Book appears too late to make its contents news. No large national association with only 2700 members can produce a service for its members that justifies the payment of the dues. Our members are largely members out of love and respect for the grand old A. Ph. A. which has kept the fires of pharmaceutical science and ethics burning these past 66 years. But during these 66 years pharmacy has changed radically as a trade and profession. Has the A. Ph. A. appreciated that fact and acted upon it? Pharmacy is to-day more largely merchandizing than it was not only 66 years ago but as late as 20 years ago. The great advances in pharmacy are made in the research laboratories of the pharmaceutical and chemical manufacturers and due to the facilities of these laboratories in controlling and standardizing the strength of these products, the average retailer is not in a position, in most cases although he may desire to do so, to assay and assure himself of the proper quality of his goods. Besides this the successful stores, be they chain stores or not, carry many side-lines, and to be successful a pharmacist must be a capable merchandizer which means buy at the right time and price and know how to make inducements to customers to buy his goods. The day for the highly skilled pharmacist, who has a full line of the necessities for compounding prescriptions and a high standing in his profession that logically gives him the right to expect people to flock to his store for that reason to have their prescriptions compounded, is a thing of the past. It was because the A. Ph. A. failed to realize and appreciate this and act upon it that the N. A. R. D. was formed and its pronounced success as compared to the A. Ph. A. in number of members and consequent service rendered to its members is well known to you all.

"Let us Face the Facts" is the terse expression used by one of our most distinguished and highly esteemed ex-presidents for the growth of mercantile as against scientific pharmacy in the retail drug trade of to-day. To this I say Amen, and the way to "face the facts" most effectively is to bring about conditions in pharmacy that will not let the material side of pharmacy take the bit in its teeth and run away with the professional side, for then we will lose our ideals and our inspiration for progress in our profession; nor let the dreamers of the ideal pharmacy of the last century blind themselves and all of us against meeting the instruction and course of thought and state of mind necessary to meet the inroads of the chain store and drug department store. However, there is not room for both the A. Ph. A. and the N. A. R. D. if the maximum of service and the maximum of progress in the science of pharmacy are to be achieved. Both associations as now organized and conducted are working more or less at cross purposes and not in sympathy. They thus divide their influence, their strength, standing and their potentiality in half and when to this is added the separate activities, influence, power and potentiality of the wholesale druggist, the manufacturing chemist and pharmacist, the physician supply pharmacist, the proprietary manufacturer, etc., the influence, power, strength, and potentiality of each one of them has been so much divided that they do not and cannot produce enough income to give proper service return to members for their membership fees, to produce enough influence to secure a pharmacy corps in the army or prevent undesirable or secure desirable legislation in pharmacy, to produce enough power through money resource and standing to secure the publicity so much needed to educate the public up to knowing what the dispenser and compounder of medicines really means to their life and health.

Has it ever occurred to you to what little extent the pharmacist ever receives any publicity in the press of to-day, and how little the general public knows about his work? About the only kind of publicity he receives is of the undesirable sort

such as when some would-be suicide buys from him some carbolic acid or mercuric chloride. Under the federation of pharmaceutical associations as proposed there would be a department which would write up the achievements of pharmacy, her place in our every-day life and the good things pharmacists do and have always done. Only by the financial income made possible by federation could competent men be secured to specialize on such publicity systematically all over the land.

As desirable as it may be to "face the facts" that pharmacy is fast becoming a merchandizing business rather than a profession in order to get the correct viewpoint of the pharmacy of to-day and as necessary as it doubtless is to develop in pharmaceutical training and experience a talent and a knowledge for successful merchandizing, let me warn you that there is as well grave danger ahead for pharmacy if she deserts her mortar and pestle for the bargain counter and paying specialty. If the successful drug store of to-day is apparently the store of the chain or the store of the specialty controlled in either case by a large corporation; is such a store the proper one to maintain the purpose and need so well instilled in the mind of the physician and the public? Must we not, in other words, maintain our facilities and practice and reputation for compounding prescriptions if we hope to maintain the standing of our profession and its future life? Is not the growth of physicians supply manufacturing pharmacists in direct ratio to the decadence of the prescription counter at the expense of the bargain counter? If this is so—and I have no doubt that many of you agree with me that it is—then it seems wise to have our proposed federated association impressed with the importance of keeping the fires of pharmaceutical science burning at all hazards even though these be tempered with the merchandizing training needed to hold the public interest and attention. When the prescription threatens to become a lost art then will pharmacy be a dead science indeed.

Let us consider the journal so ably edited by our representative pharmacist and teacher, Prof. E. G. Eberle. He is doing the very best quality of conscientious progressive work that can be done. But the journal does not arouse much enthusiasm nor does it effectively stimulate membership nor does it bring up-to-date news in discovery or practice. It replaces our proceedings and spreads out over one year the occurrences of our annual meetings with a certain limited amount of special articles or editorials, branch meeting news, etc. When this reaches the member it is mostly old news, it occurred anywhere from thirty days to twelve months ago. This is not the editor's fault—it is the unfortunate condition created by the association and council when it did away with the Proceedings. As for me, give me the old volume of the Proceedings every time where I can find what I want in a moment and have it all compact. The result is the journal has but little circulation except among our own members and enjoys in consequence but a limited advertising value and secures but little income from this important source.

The same applies to the N. A. R. D. journal to some extent, and both editors are expected to edit the journals and secure the advertisements to make it self-sustaining and neither of them can successfully accomplish both and do not in consequence. In journals as in pharmacies we have by far too many of them for the good of the profession and for any to be of the quality they should be. Under federation with a membership of 25,000, think of what a journal the Association could produce and what a real chance Professor Eberle would have to produce something more nearly in keeping with his ideals and with the journals of the A. M. A. and the A. C. S. Then the Year Book, once the report on the progress of pharmacy of the old Proceedings. Surely the quality of the work that Professor Army is turning out leaves nothing to be desired. It is a splendid achievement and one of which this Association can well be proud. As a report on the progress of pharmacy it simply cannot be improved upon. But it reaches our members anywhere from one to three years late. Most of our members and most

pharmacists probably do not use it to the extent they should, but those that do are getting very old news and they are not as satisfied as they should be.

This is not Professor Arny's fault, for he is a very busy man and he can put in only his spare time to do this terrific amount of work and he simply cannot do more than he does nor could anyone else unless he were paid to devote all his time to the work with plenty of assistants working under the same conditions. This we cannot afford to do and so we must do the best we can under the inevitable handicap produced by the limited income produced by only 2700 members.

Let us face the situation as to what we propose to accomplish by federation; of what does it consist and how can we bring it about in a successful, useful and practical way.

We propose to accomplish, by federating all national and state pharmaceutical associations into one large association, the following important things:

1. A largely increased representative membership representing practically all those interested in and engaged in pharmacy in all its branches. As there are about 50,000 such available members we should secure at least 25,000, and if my ideas and plans are realized I feel we will get 35,000.

2. Unity of purpose and action in all matters pertaining to legislation, education, publicity, ethics, standards, methods, economics, and efficiency in pharmacy.

3. Real service to all pharmacists in the matter of a real leading journal and of permanent management and activity by competent well-paid men in laboratory work, legal advice and protection, expert advice, employees, trade marks and patents, exchange of unsalable goods, support and backing when unjustly attacked in press or court. We will, in short, be able to give more than a real *quid pro quo* in return for membership fees so that membership in the federated association will be a hall mark in pharmacy and be necessary to enable a pharmacist not a member to successfully compete with one who is a member.

4. A gradual elevation of the quality of those who enter the profession by a unanimous decision so to do. This is not possible with the divided interests that exist to-day, but quite possible when all favor it, work for it, and stand for it. This will gradually but effectively create increased recognition of the profession by the public and the law-making bodies of the nation.

5. Increased prosperity for the individual members in their business, due to decreased competition, increased efficiency and service, and less capital required to do business, due to the cooperation of all for the common good.

Federated pharmacy, as I conceive it, consists of a consolidation of all national and state pharmaceutical associations into one large association with a new constitution and by-laws, with a permanent set of offices and laboratories, library and bureaus in one building either owned or leased by the association and permanently managed by a Board of Control consisting of three well-paid, competent men. It means that all these national associations and state associations shall continue their individual existence as they are now and manage and direct their own affairs in their own particular line just as they have been doing by their own officers and organizations as heretofore. Thus the wholesale druggists will continue to be known as the N. W. D. A. or the Wholesale Section of the federated association and the same for the retail druggists which shall be known as the N. A. R. D. or the Retail Section of the federated association, etc. These will be analogous to the several sections of the A. M. A., as for instance the Gynecological Section of the A. M. A., etc. I use the words Federated Association because while I fully believe the name of this Federated Association should be and will be the American Pharmaceutical Association, I appreciate that this is a matter which the Federated Association, when formed, should itself decide. All matters, however, pertaining to the wholesale drug trade will be acted upon and decided upon in the meetings of that section of the federated association and their action shall be final and not subject to any review or action by the Federated Association and the same applies to the N. A. R. D. section, the manufacturers' section, the A. C. of Ph. F. section, etc. All matters, however, pertaining to general pharmacy shall be taken up, considered and acted upon in the House of Delegates and Council or upper chamber

of the Federated Association, such as legislation, ethics, publicity, service, law, relations to the public, to other associations, the state, the nation, etc. Wherever an united front is needed to accomplish a needed reform or law, the defeat of undesirable legislation or a desirable purpose helpful to pharmacy, the consideration should be had in the House of Delegates of the Federated Association. Membership in the Federated Association shall be individual and shall entitle the member to all publications and services of the association. If the sections determine to offer special services to their members for which they will charge special fees this will of course be quite proper; and for section memberships corporations, as well as firms or individuals may be eligible. Membership in the section also carries membership in the association but in case of corporations or firms these must name an officer or member of their firm or company to represent them in the association. Instead of going into all the details of the proposed federation I will submit herewith as part of this address a tentative plan for federation, which I have drawn up to serve as a practical basis for discussion of an actual method of effecting the proposed federated association and which I will read.*

From this you will see that practically everything is provided for and that a list of bureaus and laboratories is proposed which will render the services to which all members are entitled. Let me just refer especially to a few of these. The bureau of chemistry and pharmacy will be a laboratory where members can send their preparations or products to have them examined, tested or analyzed as to their label, literature, excellence of product, correctness of assay or strength, etc. This will be an advantage because they will know that it is being done by a friendly though accurate and just agency which will advise them fully about it and in confidence.

The exchange bureau for unsalable goods will enable them to exchange unsalable goods for salable goods and thus reduce their stock and with it the amount of money tied up in their business. Thus in many ways will it be possible in an association of which all pharmacists are members to be of service and assistance to members who will feel that they have back of them in this service the entire pharmaceutical profession.

The state associations will be integral parts of the federation, and membership in the federated association will entail membership in the state association. Whether they will be affiliated through the House of Delegates as such or whether they will be asked to form an association of state associations and have this represented in the House of Delegates by five delegates just as are all other national associations, is a matter which the federation must decide. To my mind it would be preferable for all the state associations like all state boards of pharmacy to form a national association of state associations and that this should meet as a section of the federated association attended by delegates duly appointed from each state association. They could in such an association harmonize many of their differences and points of opposition in prerequisite laws, licensing of pharmacies or pharmacists or both; educational requirements, etc., etc. They would have their voice in the federated association by being represented by five delegates similar to every other national association. Thus would the influence and organizing power of the federated association be much increased, spreading out and reaching into every state just as the A. M. A. does, only in case of the latter this is more complete still and extends to the county medical association, *i. e.*, subdivision of the state. We have provided in a way for this county association by the establishment of our local branches, which would of course be part of our association and eventually become subdivisions of the state associations.

We can bring about this badly needed and greatly to be desired federated association by all those engaged in pharmacy or any of its branches deciding to be willing to give and take and to agree that to be part of an united fraternalized profession is much better than to think only of ourselves and our special interest

* See September issue.

and let the others look after themselves. If we all agree not to want everything just our own way but accept a state of mind and organization that offers benefits to all that are impossible when we each paddle our own canoe, no reason exists why we should not federate our interests and in helping ourselves also help the other fellow. Then we can form such a federated association and develop an organization and a management as will enable pharmacy to hold its own with any other association or profession and secure many of the advantages and needed recognition now denied us because we are so unharmonious and uncoöperative.

Each association should then name delegates to represent it and act for it at a convention of associations called for the special purpose of forming a federated association, provided this is not accomplished as I hope it will be at the special meeting of our House of Delegates called for that purpose at this meeting Wednesday, August 14, at 4.30 P.M. My reason for hoping and believing that federation should be decided upon and entered upon now is that the time is opportune, the moment psychological and the world-spirit in harmony with federation and consolidation.

When you consider what medicine was before there was a large united A. M. A. and what it is now and what its relative influence and power was then and is now; and when you consider what a more or less useless and theoretical thing the American Chemical Society was once and what a powerful force for constructive good and influence it is now, you must appreciate and see what possibilities in growth, strength, influence, power and standing lie before pharmacy if she will only do as they did, and federate all her interests into one large association presenting a united front to all questions and problems that confront it. We are now in the position of the thirteen separate states and like them a prey to any united agency attacking us and in consequence usually, as in case of our pharmacy corps, laid low in the contest. When these thirteen states became the United States they surmounted all obstacles, accomplished many great things and eventually as to-day have become the greatest uplifting and constructive force in the world for the welfare of mankind and the struggle for liberty and the rights of man. Shall we remain the thirteen states or shall we become the United States, that is the great question which I now leave in your hands and in your hearts?

TO UNIFY MEDICAL NOMENCLATURE.

The medical section of the Council of National Defense has taken the initial steps toward establishing a uniform medical nomenclature and terminology in official and unofficial circles. The plan is to have the surgeon-generals of the Army, Navy and Public Health Service appoint representatives to confer on the matter of agreement concerning the names of diseases and injuries, as well as symbols, abbreviations, etc., and after a tentative list has been prepared it is proposed to call together representatives of the leading national bodies with a view to obtaining general agreement. It is expected that if the Government adopts a uniform nomenclature, the 20,000 doctors now in the military and naval service will, when they return to civil life, bring the standard terms into general use throughout the country. While this scheme is excellent as far as it goes, it appears to suffer from the limitations of provincialism that seem inseparable from nomenclatorial reforms started in this country. Apparently it has not occurred to its promoters that medical English is not monopolized by the United States, and that in seeking a uniform nomenclature the coöperation should be invited, on equal terms, of the medical authorities of Great Britain. This is especially desirable at the present time, in view of the fact that many American doctors are serving with the British forces.—*Scientific American*.

DISTINCTIVE PROPERTIES AND CLASSIFICATION OF ORGANIC AND COLLOIDAL SILVER COMPOUNDS.*

BY TORALD SOLLMANN.

CONTENTS.

1. Objects.
2. Tests and Data.
3. Classification.
4. Distinctive Properties of the Drugs.

I. OBJECTS.

A large number of silver protein compounds are now on the market, and it is desirable to classify these in a logical manner. Collargol, Argyrol and Protargol, for instance, evidently represent quite distinct types. May the other compounds be arranged under these three types, or are further groups necessary? What should be the criteria for a classification? The following investigation is intended as a partial and tentative answer to these questions. It includes the application and the discussion of a series of tests and data to the silver-protein and colloidal silver compounds accepted in "New and Non-official Remedies"¹ and of a few which have not yet been accepted.²

2. TESTS AND DATA.

Condition of the Silver.—Silver ions precipitate ordinary proteins and are therefore highly irritant to the tissues. Compounds containing their silver in non-ionized or "masked" or "colloidal" form do not precipitate and therefore largely avoid the irritation. This is the main object in the therapeutic use of these silver compounds. Various precipitant reactions may be used as tests for free silver ions. The most convenient, perhaps, is the precipitation of chlorides. A modification of this will be described later.

It may be stated now that all but two of the preparations contain all of their silver in non-ionized form; and these two (Albargin and Roche Silver Nucleinate) contain only a small, but not negligible, amount of ionized silver, presumably as a contamination.

Total Silver Content.—The quantities claimed by the manufacturers are shown in Table I. It will be noted that the content of the three typical compounds, collargol, argyrol and protargol, are distinctive; and the most of the other compounds approach one or the other of these types. It remains to be seen whether this coincides with other distinctive properties. Actually this is very generally the case.

Protein Component.—This is not very important, since it is practically a mere vehicle. Some of the manufacturers prefer to keep its nature secret, as a valuable manufacturing asset. Others follow the much more reprehensible course of giving misleading names to their proteins. This abuse is not easily stopped, since there is no known method for identifying the protein in the finished product. The data, as far as known, are shown in Table I.

* This investigation is partially supported by a grant from the Committee on Therapeutic Research of the Council on Pharmacy and Chemistry of the American Medical Association.

¹ Electrorgol was not included, because of its very low silver content.

² Silver proteinate, Heyden; Silver nucleinate and proteinate, Roche; Solargentum, Squibb; and Silvol.

TABLE I.—TOTAL SILVER CONTENT, AND PROTEIN COMPONENT.

| Drugs (arranged in order of silver content). | Claimed per- centage of silver | Claimed protein base. |
|----------------------------------------------------|--------------------------------------|---------------------------------------------------------|
| Collargol | 78 | |
| Cargentos | 50 | |
| Argyrol | 20-25 | Vitellin (in reality probably denatured egg albumen) |
| Squibb Silver Prot. | 19-23 | Gelatin |
| Roche Silver Nucl. | 20 | Probably denatured serum albumen |
| Solargentum | about 20 | Gelatin |
| Silvol | 20 | ? |
| Sophol | 20 | Methylen nuclemic acid |
| Albargan | 15 | Gelatin |
| Novargan | 10 | Albumin(?) |
| Protargol | 8-3 | Albumin(?) |
| Heyden Silv. Prot. | 8-3 | Albumin(?) |
| Roche Silv. Prot. | 8-0 | (?) |
| Hegonon | 7 | Albumose |
| Argonin | 4.28 | Casein |

Antiseptic Efficiency.—The silver-protein compounds are used almost exclusively on mucous membranes, for antiseptic or astringent, or for demulcent effects. A classification according to antiseptic efficiency would be desirable, but does not appear feasible at present. The results of culture experiments cannot be transferred with confidence to clinical conditions; and no satisfactory technic has been developed for life-tests.

Irritation.—This is perhaps the most important criterion for a clinical classification. It is easily judged by placing a few drops of the 1 : 10 watery solutions¹ in the nostrils, and in case of doubt also in the conjunctival sac. The method is subjective and incapable of absolute quantitative expression. Nevertheless the differences are sufficiently striking to permit arrangement into three groups, as in Table II.

The data refer to a 1:10 aqueous solution in the nostrils. Those which were also tried in the conjunctiva are marked **.

TABLE II.—IRRITATION.

| No irritation | Slight but distinct. | Marked irritation. |
|------------------------------|-------------------------------------------------|-----------------------|
| Argyrol | Protargol | |
| Argonin (5%) | Heyden Silv. Prot. | |
| Silvol** | Cargentos | Albargin ² |
| Sophol | Silv. Nucl. Roche | |
| Squibb Silv. Prot. | Silv. Prot. Roche** (very slight ²) | |
| Novargan | Hegonon** (very slight) | |
| Collargol | | |
| Collargol Old (5%) | | |
| Solargentum | | |

Albumen Precipitation.—This is in a sense an index of astringency. However, it was observed that some non-irritant preparations may, nevertheless, give a

¹ 1 : 10 Solution of the Silver Salts: 0.5 Gm. of the salt is dissolved in 5 Cc. of distilled water. This solution is also used for the egg-test, the absorption test, and the color index.

² Albargin gives a precipitate with sodium chloride. The filtrate from this appears less irritant. This suggests that the irritation is due largely, if not solely, to free silver ions.

precipitate with albumen. This is most conspicuous with silver. It may be that, in this case, the precipitation is due to a change of the colloidal state of the silver compound rather than in the albumen.

However, the test as elaborated, at least helps to distinguish certain of the compounds that are otherwise closely related. It is also an objective confirmation of the distinct though slight astringent action of all the members of the protargol type (Protargol, Roche and Heyden Silver Proteinate; and Hegonon); and of the marked astringent action of those containing free silver ions (Albargin; Roche Silver Nucleinate).

Technic of the Egg Test.—About $\frac{1}{2}$ inch (about 2 Cc.) of undiluted egg white is placed in a test-tube. To this is added 1 Cc. of 1 : 10 solution of the silver salt. They are thoroughly mixed by shaking, then allowed to stand for about 15 minutes, and then diluted with 15 Cc. of water. If this is too deeply colored, more water may be added. (The egg-white must be added undiluted, as stated.) The results are shown in Table III.

TABLE III.—ALBUMEN PRECIPITATION.

| | |
|-------------------------------------|-------------------------------------------|
| <i>The mixture remains clear:</i> | <i>The mixture is distinctly turbid:</i> |
| Argyrol | Protargol |
| Squibb's Silver Prot. | Novargan |
| Solargentum Squibb | <i>There is a distinct precipitation:</i> |
| Collargol | Heyden Silver Prot. (curdy) |
| <i>The mixture is nearly clear:</i> | Cargentos (very fine) |
| Argonin | Silvol (very fine) |
| Sophol | Silv. Nuclein Roche (curdy) |
| Silv. Prot. Roche | <i>Abundant curdy precipitate:</i> |
| Hegonon | Albargin (2 samples) |
| | <i>Unsuited for test</i> |
| | Collargol, old sample |

Adsorption.—The difference between the preparations are presumably based largely upon differences in their colloidal state. It was attempted to demonstrate them by the behavior toward adsorbents. "Permutit" was found to have no distinct effect on argyrol solutions and very little on protargol. "Lloyd's reagent," however, showed characteristic differences in the decolorization for the members of each group, although it had no apparent relation to a broader classification.

Technic.—One Cc. of a 1 : 10 solution of the silver salt is diluted with 0.5 Gm. of "Lloyd's Reagent" (Hydrated Aluminum Silicate), allowed to stand for a few minutes, and filtered. The color of the filtrate is noted.

The degree of decolorization is shown in Table IV.

TABLE IV.—ADSORPTION OF COLOR BY "LLOYD'S REAGENT."

| Practically completely destroyed. | Considerably destroyed.* | Little, if any, decolorized. |
|-----------------------------------|--------------------------|------------------------------|
| Argyrol | Protargol | Cargentos |
| Albargin (2 samples) | Silv. Prot. Heyden | Collargol |
| Argonin | Novargan | Sophol |
| Collargol, old sample | Silvol | Solargentum Squibb |
| Silv. Nuclein Roche | Hegonon | Silver Prot. Squibb |
| Silv. Prot. Roche | | |

* These are arranged in order of decreasing adsorption, the protargol filtrate being the least colored, and hegmon the most.

To a portion of the filtrate (further diluted if too dark) is added a drop of 25% sodium chloride, to reveal free silver ions. (Silver nitrate, even in very dilute solution, is not adsorbed by Lloyd's Reagent.)

Free Silver Ions.—The sodium chloride test is conveniently applied to the filtrate from the Lloyd's Reagent. The test was found negative with all but Albargin (two samples) and with the sample of Roche's silver nucleinate.

The presence of free silver ions renders the solutions irritant, and therefore defeats the special object of the protein compound.

Solubility Behavior.—Table V shows that nearly all the protein silver compounds dissolve promptly and completely, at least to 25%, when placed in contact with water. The most conspicuous exception is Argonin, which dissolves slowly and imperfectly, like dried serum.

A strikingly abnormal solution behavior is also shown by an old sample of Collargol, which could not be suspended in water. This had been kept in an amber, glass-stoppered bottle probably for over ten years.

TABLE V.—SOLUBILITY BEHAVIOR.

The following observations were recorded in making the 25% solutions:

Solution complete and very prompt:

Argyrol

Solution complete and prompt:

Protargol

Roche's Silv. Nucleinate

Squibb's Silv. Prot.

Silvol

Solution complete and fairly prompt:

Albargin

Hegonon

Heyden Silv. Prot.

Novargan

Sophol

Solargentum

Solution fairly prompt, but not quite complete:

Roche Silv. Prot.

Undissolved, sticky mass, 10% also incomplete, 1% is turbid:

Argonin

Permanent colloidal solution when triturated in water:

Cargentos

Collargol

Not miscible with water:

Collargol, old sample

Specific Gravity of 25 Percent Solutions.—Some ophthalmologists use the protein-silver compounds, especially the Argyrol type, for their specific gravity rather than for their antiseptic effect, the idea being that the heavier silver solutions would displace the secretions, pus and bacteria by gravity. Some such mechanical action would doubtless occur, if the patient is placed in the proper position; but if this has any value it would be obtained equally well, and much more cheaply, by a 25% solution of acacia.

The "25%" solutions were made by dissolving 0.5 Gm. of the substance in 1.5 Cc. of distilled water. The specific gravity was determined by weighing 1 Cc.

in an Ostwald pipette, at 20° C. The results are shown in Table VI, in descending order.

TABLE VI.—SPECIFIC GRAVITY OF 25% SOLUTIONS.

| | |
|------------------------|-------|
| Collargol..... | 1.230 |
| Cargentos..... | 1.166 |
| Solargentum..... | 1.159 |
| Argyrol..... | 1.147 |
| Acacia..... | 1.137 |
| Silvol..... | 1.137 |
| Sophol..... | 1.132 |
| Roche Sil. Nucl..... | 1.123 |
| Albargin..... | 1.112 |
| Heyden Silv. Prot..... | 1.108 |
| Protargol..... | 1.104 |
| Roche Silv. Prot..... | 1.100 |
| Hegonon..... | 1.093 |
| Novargan..... | 1.090 |
| Squibb Silv. Prot..... | 1.088 |

Argonin is not soluble to 25%. A 2.5% solution has the specific gravity—1.010.

Viscosity of 25 Percent Solutions.—This has no special relation to the natural groups, and is probably without clinical significance. It was estimated by the time of outflow from a 1 Cc. Ostwald pipette (from the 1 Cc. mark, to the junction of bulb and beak), at 20° C. The results shown in Table VII are arranged in descending order.

TABLE VII.—VISCOSITY OF 25% SOLUTIONS.

| Name. | Seconds required for outflow. (Water = 40 seconds.) | Viscosity. (Water = 1.) |
|------------------------|-----------------------------------------------------------|----------------------------|
| Hegonon..... | 285 | 7.125 |
| Sophol..... | 180 | 4.125 |
| Albargin..... | 174 | 4.350 |
| Squibb Silv. Prot..... | 135 | 3.375 |
| Cargentos..... | 120 | 3.0 |
| Roche Silv. Nucl..... | 102 | 2.550 |
| Protargol..... | 75 | 1.875 |
| Novargan..... | 71 | 1.775 |
| Argyrol..... | 54 | 1.350 |
| Heyden Silv. Prot..... | 53 | 1.325 |
| Silvol..... | 50 | 1.250 |

Acacia: The 25% solution flowed too slow for measurement. A 10% solution (1 Gm. + 9 Cc.) flowed in 165 seconds, corresponding to a viscosity of 4.125.

Argonin, Collargol, Solargentum, and Roche's Silv. Prot. did not dissolve completely, and thus could not be measured.

APPEARANCE OF THE COMMERCIAL PRODUCTS: This is only of incidental interest. The specimens may be arranged as follows:

Coarsely granular

- Argyrol (dull black masses)
- Collargol, old sample (dull gray-black masses)
- Collargol, fresh sample (brilliant steel blue granules)
- Solargentum (bright black granules)

Bright black scales:

Cargentos
 Silv. Nucl. Roche
 Silv. Prot. Squibb
 Silv. vol

Coarse Powders:

Albargin (appearance of dried albumen)
 Argonin (buff)

Fine powders: (arranged in order of decreasing depth of color)

Heyden Silv. Prot. (dark red to dark chocolate tint)¹
 Sophol (chocolate)
 Protargol (reddish brown)¹
 Roche Silv. Prot. (milk chocolate)
 Hegonon (milk chocolate)
 Novargan (buff)

Depth and Color of Transparency of 1 : 1000 Solutions.—This is a rough but useful aid to identification. The clearness or turbidity to reflected light appears related to the natural groups, the colloidal silver and the protargol type being generally turbid, whereas the argyrol type is generally clear.

For making the comparisons, one Cc. of 1 : 10 solution is added to 100 Cc. of water in a conical "urine-glass." The results are shown in Table VIII.

TABLE VIII.—APPEARANCE OF 1 : 10000 SOLUTIONS.

| | Solution clear both with transmitted and reflected light. | Clear with transmitted light, but turbid by reflected light. | Turbid but with transmitted and reflected light. |
|-----------------------------|------------------------------------------------------------------------------|--------------------------------------------------------------------|--------------------------------------------------------|
| Color very deep | | Cargentos | Collargol |
| Color deep | Argyrol Silvol Solargentum Silv. Prot. Squibb | Silv. Nucl. Roche | |
| Color moderate | Hegonon Protargol ² Silv. Prot. Heyden Silv. Prot. Roche | Albargin Sophol | |
| Partially colored | Novargan | | |

Argonin has a different, violet tinge, and is turbid both by transmitted and reflected light.

Color Index.—Colorimetric measurements furnish a more accurate quantitative expression of the color-intensity. This is fairly characteristic for the groups, the collargol group standing the highest, the argyrol group intermediate, and the protargol group lowest. There are, however, individual exceptions. The color intensity increases with the silver content, but not in simple proportion.

Technic.—The 1 : 1000 to 1 : 50,000 solutions are compared with tenth normal potassium dichromate in a Duboseq colorimeter, set at 20. The tints do not match well, but sufficiently so to express the great difference in intensity.

The *simple color index* expresses the ratio of the color intensity of the 1 : 1000 solution of the silver compound, to the tenth-normal dichromate solution.

The *silver color index* is the simple index, divided by the percentage of silver in the compound. The results are shown in Table IX, with the compounds arranged in descending order of silver-color index.

¹ Different samples of Protargol and Heyden's Silver proteinate vary considerably in color.

² Different samples of Heyden's Silver Proteinate and of Protargol vary materially in color.

TABLE IX.—COLOR INDEX.

| Name of substance. | Dilu- tion. | Match of tint. | Read- ing. | Simple index. | Silver index |
|-----------------------------------|----------------|-------------------|---------------|------------------|-----------------|
| Collargol..... | 50,000 | fair | 16 | 62.5 | 0.80 |
| Heyden Silv. Prot. (average)..... | .. | .. | .. | 3.14 | 0.39 |

SUMMARY.

The colloidal and silver compounds may be arranged into a few typical groups:

The Collargol Group, comprising Collargol and Cargentos.

The Argyrol Group, Argyrol, Squibb's Silver Proteinate, Sophol, and Silvol and Solargentum.

The Protargol Group: Protargol, Roche's Silver Proteinate, Heyden Silver Proteinate, and Hegonon.

The Free Silver Group: Albargin and Roche's Silver Nucleinate.

The Pale Group: Novargan and Argonin.

The distinctive data of these groups are shown in Table X; the detailed data are reproduced in Tables I to IX, arranged according to the tests; and in Tables XI to XIV, arranged according to the drugs.

PHARMACOLOGIC LABORATORY OF THE MEDICAL SCHOOL OF
WESTERN RESERVE UNIVERSITY, CLEVELAND.

VARIATIONS IN NUX VOMICA AND ITS PREPARATIONS.*

BY HUGO H. SCHAEFER.

One of the more important changes in the U. S. P. IX as compared to the former revision is that of the alkaloidal requirement for Nux Vomica and its assay process. The former requirement called for 1.25% strychnine and in its determination the well-known assay process was used in which the total alkaloids are extracted, the brucine destroyed, by means of nitric acid and the remaining alkaloid calculated as strychnine. In the U. S. P. IX the requirements are for 2.5% total alkaloids and the assay process is of course based on the simple extraction and titrating of all the alkaloids of Nux Vomica.

It was found by the author that a greater percentage of samples of Nux Vomica met the requirements of the new Pharmacopoeia than that of the old. In other words that 2.5% total alkaloids was a lower standard than 1.25% strychnine. In order to definitely determine this question a number of samples of powdered Nux Vomica were taken and assayed according to the U. S. P. IX for total alkaloids. After titrating the latter the solution was made alkaline with ammonia water, completely shaken out with chloroform, the latter evaporated and the residue taken up with 15 mls of 3% sulphuric acid. This solution was now treated with nitric acid to destroy the brucine and the assay completed as described in the U. S. P. VIII, for the determination of strychnine. This data so obtained gave the total alkaloidal content, the percentage of brucine and that of strychnine in Nux Vomica, it being taken for granted that the other alkaloids present appear in so small a quantity as to justify their not being considered. The results obtained were as follows:

| POWDERED NUX VOMICA | | U. S. P. VIII = 1.25% STRYCHNINE. U. S. P. IX = 2.5% TOTAL ALKALOIDS. | |
|---------------------|----------------------------------------|--------------------------------------------------------------------------|----------------------------|
| Sample. | Total alkaloid. Method U. S. P. IX. | Strychnine. Method U. S. P. VIII. | Brucine. by difference. |
| A..... | 2.64% | 0.88% | 1.76% |
| B..... | 2.93 | 1.32 | 1.61 |
| C..... | 2.52 | 0.73 | 1.79 |
| D..... | 1.92 | 0.73 | 1.19 |
| E..... | 2.97 | 1.54 | 1.43 |
| F..... | 3.21 | 1.25 | 1.96 |
| G..... | 2.71 | 1.30 | 1.41 |
| H..... | 3.53 | 1.30 | 2.23 |
| I..... | 2.38 | 1.26 | 1.12 |

A number of interesting points may be obtained by studying these results. Of the nine samples all but two would come up to the requirements of the U. S. P. IX while three would not meet those of the U. S. P. VIII. Samples A and C would pass U. S. P. IX but not U. S. P. VIII. Sample D would pass neither the old nor the new requirements while Sample I would pass the U. S. P. VIII and not IX. There therefore seems to be absolutely no relation between the percentage of total alkaloid and that of strychnine. The percentage of strychnine in the total alkaloid varies from 33 to 53%.

Samples of fluidextract and tincture of Nux Vomica were now taken at random and assayed in similar manner as before described, first in accordance with the

* Read before New Jersey Pharmaceutical Association, 1918 meeting.

U. S. P. IX to determine total alkaloid after titration was shaken out with chloroform and the strychnine determined according to the U. S. P. VIII with the following results:

| FLUID EXTRACT { U. S. P. VIII = 1% STRYCHNINE. U. S. P. IX = 2.37-2.63% TOTAL ALKALOIDS. | | | |
|---------------------------------------------------------------------------------------------|---------------------------------------|-------------------------------------|---------------------------|
| Sample. | Total alkaloid. Method U. S. P. IX | Strychnine Method U. S. P. VIII. | Brucine by difference. |
| A..... | 2.46% | 0.79% | 1.67% |
| B..... | 2.64 | 1.27 | 1.37 |
| C..... | 2.51 | 1.03 | 1.48 |
| D..... | 2.39 | 0.91 | 1.48 |
| E..... | 2.41 | 1.21 | 1.20 |
| F..... | 2.48 | 0.77 | 1.71 |

| EXTRACT { U. S. P. VIII = 5% STRYCHNINE. U. S. P. IX = 15.2-16.8% TOTAL ALKALOIDS. | | | |
|---------------------------------------------------------------------------------------|---------------------------------------|--------------------------------------|---------------------------|
| Sample. | Total alkaloid. Method U. S. P. IX | Strychnine. Method U. S. P. VIII. | Brucine by difference. |
| A..... | 15.41% | 4.93% | 10.48% |
| B..... | 16.32 | 6.69 | 9.63 |
| C..... | 14.89 | 5.21 | 9.68 |
| D..... | 17.1 | 8.21 | 8.89 |
| E..... | 15.61 | 6.71 | 8.9 |
| F..... | 16.45 | 6.01 | 10.44 |

| TINCTURE { U. S. P. VIII = 0.1% STRYCHNINE. U. S. P. IX = 0.237-0.263% TOTAL ALKALOIDS. | | | |
|--------------------------------------------------------------------------------------------|----------------------------------------|--------------------------------------|---------------------------|
| Sample. | Total alkaloid. Method U. S. P. IX. | Strychnine. Method U. S. P. VIII. | Brucine by difference. |
| A..... | 0.241% | 0.111% | 0.130% |
| B..... | 0.271 | 0.084 | 0.187 |
| C..... | 0.213 | 0.079 | 0.134 |
| D..... | 0.224 | 0.114 | 0.110 |
| E..... | 0.251 | 0.080 | 0.171 |
| F..... | 0.249 | 0.102 | 0.147 |

Again the results show that there is absolutely no relation between the percentage of total alkaloid and that of strychnine and some of the samples while meeting the requirements of our present Pharmacopoeia show a decided deficiency in strychnine content as required by the U. S. P. VIII.

The question therefore suggests itself whether it would not be better to have both a requirement for total alkaloid and for strychnine. Considering the results obtained from the powdered Nux Vomica, Sample C contained 2.52% total alkaloid and yet is of decidedly inferior quality since it only contains 0.73% strychnine. On the other hand Sample I contains 1.26% strychnine but only 2.38% of total alkaloids therefore also of inferior quality. In the opinion of the author no difficulty would be had in obtaining Nux Vomica on the market, which contains at least 2.5% total alkaloids and 1.25% of strychnine. The combination assay process as suggested before could be used thereby requiring only one sample for the entire assay and making it a little more difficult and complex than the assay of the U. S. P. IX.

SOME OBSERVATIONS ON THE DISSOLVING OF ZINC CHLORIDE AND SEVERAL SUGGESTED SOLVENTS.*

BY JOSIAH C. AND BERTHA L. DEG. PEACOCK.

The salts of zinc which are soluble in water, especially the sulphate, acetate and chloride, have long been used in injections, lotions, eye-washes, mouth-washes and other such forms of application, usually in weak solutions, a few grains to the ounce.

The sulphate and acetate of zinc readily dissolve in water without residue; but zinc chloride upon contact with water has a strange behavior, and when treated with water in large proportions leaves an insoluble residue known as oxychloride, or basic chloride of zinc; it matters not which is added to the other. This undissolved portion is bulky, therefore impressive as to quantity especially when resulting from one or two grains of zinc chloride intended for eye-drops. That it does contain both zinc and chlorine, we have assured ourselves by qualitative analysis; it may therefore be rightly termed, basic chloride of zinc, or oxychloride. Whatever of oxide of zinc or oxychloride of zinc was present in the sample dissolved may also be looked for here.

In order to appreciate the quantity of oxychloride usually left undissolved, let us cite a reference found in the Proceedings of the American Pharmaceutical Association, 1896, page 715, "Zinc Chloride-Dissociation by Water" Perrot has observed that when zinc chloride, free from oxide was dissolved in water, a precipitate was formed, which had the composition $\text{ZnCl}_2 \cdot 5\text{ZnO} \cdot 6\text{H}_2\text{O}$. An inquiry into the relations of the quantity of water to the amount of oxychloride formed resulted in the determination that by employing 100 molecules of water, 3.75 percent of oxychloride was formed, the same quantity was formed with 75 molecules, 3 percent was formed with 50 molecules and 2.6 percent with 25 molecules. "The limit of the reaction is, therefore, with 75 molecules of water, the addition of large quantities giving no increase in the yield of oxychloride." *Pharm. Centrall.*, January 23, 1896, 46 from *Bull. soc. chim.*, 1895, 975.

Commercial zinc chloride may contain some pre-existent oxychloride as an impurity from over-heating in manufacture, and samples of medicinal zinc chloride such as the official grade are expected to show a separation of oxychloride under the condition named; the United States Pharmacopoeia accordingly provides a test for limit of oxychloride.

The equation commonly used to explain the change of zinc chloride through the effect of water into this basic salt is $\text{ZnCl}_2 + \text{H}_2\text{O} = \text{Zn}(\text{OH})\text{Cl} + \text{HCl}$.

As already mentioned the precipitate is strikingly bulky, but is by no means a great part of the zinc salt taken. The production of free hydrochloric acid as shown by the equation, is perhaps the reason that all of the zinc is not precipitated by the water. A proper conception of this reaction demonstrates the fact that every clear solution of zinc chloride that is obtained by dissolving zinc chloride in large quantities of water is a solution of zinc chloride plus hydrochloric acid. This is a matter to be noted toward a better understanding of the behavior of this peculiar substance, for although at this point the statement is largely inference it will, in due course, become a proven fact.

* Read before Pennsylvania Pharmaceutical Association, 1918 meeting.

Even though the undissolved matter is no great part of the zinc chloride, it does of course represent activity which it is the duty of the pharmacist to vouchsafe to the patient. Therefore, to remove it would be wrong, to dispense it in eye-drops, or similar preparation, would be useless, if not productive of more serious trouble than an explanation.

When first we encountered this behavior we could not take time to investigate it, so acting under the impression that free hydrochloric acid would be present in any event, as shown by the equation, we concluded that the most practical thing to do was to supply that through lack of which the obstacle arose; in other words, add sufficient hydrochloric acid to the zinc chloride itself to enable the water to carry all of the zinc chloride into solution, realizing as already said, that free hydrochloric acid would be present in the finished product whether all or only part of the zinc chloride was in solution, for this procedure assures the zinc to the patient.

The addition of the hydrochloric acid was made in the dispensing of several grains of zinc chloride by putting a single drop of concentrated acid upon the salt, and after mixing by trituration the water was added. When but a grain or two of zinc chloride was to be dissolved, a mere trace or touch of the acid was used, or a portion of a diluted drop. Much less acid is needed if put directly upon the zinc salt. Any mixture prepared without this addition and showing turbidity was rejected because too much acid would have to be added to the fluid. The effect of the acid added is to produce zinc chloride and water; $\text{Zn(OH)Cl} + \text{HCl} = \text{ZnCl}_2 + \text{H}_2\text{O}$ the very material desired in the product. We have often wondered "what better can be done?" Theory would indicate that the hydrochloric acid in the liquid could be neutralized by mixing it with zinc oxide or carbonate and filtering off the undissolved portion. This plan however is neither so accurate nor so simple as it appears when tried on a small lot of eye-drops.

Although the plan of adding acid had been used for many years, without any untoward effects, there might have arisen a comparison between the work of dispensers, wherein the reason for such an addition might be difficult of explanation to the lay mind, for although we believed we were acting within the bounds of right judgment, it might not have been possible to satisfy the patient that such was the case. Nor was the patient the only one who might have to be convinced of the common-sense of the plan, as we shall soon learn, and it was this apprehension, perhaps, more than any other influence that persuaded us to look for another solvent. Since undertaking this study of the subject, we find that others have practiced this method as the only practical means of dissolving zinc chloride. Indeed we find that this problem had been referred to a commission of apothecaries and physicians in Belgium, because physicians were objecting to the use of the acid. This body discomenanced the use of the acid, and recommended the use of a turbid solution or the clear liquid therefrom, either of which as has been pointed out will contain the same amount of free hydrochloric acid, *produced but not added*. Referring to the report of this commission, Dr. Paul Wiskirchen, in the *Pharm. Zeitung*, 1899, page 268, states that he finds "the addition of acid is unnecessary. He finds that if it is attempted to dissolve pure zinc chloride in cold water, or if cold water is added to a clear solution of zinc chloride, turbidity is invariably produced, but

if the solution is effected with hot water, or if the dilution is made with hot water, clear solutions result, and so remain permanently." This quotation is from the proceedings of the American Pharmaceutical Association, 1900, page 717, for which it was abstracted from the *Pharm. Centralhalle* of August 17, 1899, page 508. In the same proceedings for 1907, page 850 we find another abstract which we quote in its entirety.

"Zinc Chloride—Simple Method to Effect a Clear Solution.—Franz Wipperfurth directs attention to the fact that while pure zinc chloride usually produces a turbid solution when it is dissolved in cold water, it dissolves perfectly clear in hot water and the solution remains clear on cooling (*Pharm. Zeitung*, Li, No. 73 (1906) 807)." Wondering whether we had shut our minds to such a simple and efficient agent as hot water, we hastened to try the suggestion, but only to be utterly disappointed, for we found no appreciable difference in either the immediate or prolonged effect of hot or cold water, in dissolving the salt, or diluting concentrated solutions. If there is any perceptible difference in the effect of hot water from that of cold water, it is merely in making the sediment more dense and to settle somewhat faster, perhaps to be overlooked more easily. Not satisfied to record a refutation of these statements without sufficient proof, we made dozens of tests under varying conditions and quantities, but all to no avail. The statements are erroneous. It was now decided to look into the properties of zinc chloride itself as the most rational starting point of our quest.

One of the characters of zinc chloride which should be borne in mind throughout the consideration of this subject is that property of its solutions to turn litmus from blue to red, or, as usually described, its acid reaction. As is well known this property is common to many of the soluble salts of the metals; we merely want to remind ourselves at this time that it does not indicate free acid. The sample of zinc chloride which was employed for these experiments conformed to the U. S. P. requirements as to limit of oxychloride content and production; it also conformed to the other tests of the same standard. After a number of experiments made more or less at random to determine features which seemed to have bearing upon the matter in hand, a series of experiments was outlined through which it was purposed to follow some zinc chloride in order to note its behavior under varying conditions. Accordingly, a convenient portion of it was placed in a vessel and water added drop by drop with constant stirring. Approximately an equal weight of water dissolved it—the mixture becoming warm as solution progressed—and a practically clear solution resulted. The addition of water in small portions was continued until a decided precipitate made its appearance. These experiments were repeated several times with different amounts of zinc chloride. On an average it required over five times as much water as zinc chloride to produce a permanent turbidity or precipitate. The further dilution of these turbid solutions with water threw out more precipitate, so the addition of water was continued until to all appearances no more oxychloride was being produced. This condition appeared to be attained when twenty or more parts of water had been added. One of these mixtures was allowed to settle and the clear supernatant liquid decanted upon asbestos wool. The filtrate was placed upon a water bath for evaporation. The undissolved portion (oxychloride) was washed and boiled with

sodium carbonate to separate the zinc and chlorine, both of which were shown to be present.

Before passing on to the consideration of the evaporated filtrate let us observe some of the behaviors of the clear solution of equal parts of zinc chloride and water. The statement is common in works of reference that zinc oxychloride is dissolved by zinc chloride solution; now the fact, that up to a certain dilution a clear solution of zinc chloride is possible must certainly be conceded to be proof of this statement. The inference then would be that the total acidity of the zinc chloride solution is sufficiently powerful in that certain concentration to hold in solution any oxychloride which existed in the sample as well as to prevent the separation of the incipient oxychloride which will be manifested upon a further dilution.

Looked at from the view point which attaches to precipitated oxychloride, another significance to be gathered from this phenomenon is that there is a limit to the ability of the acidity of the zinc chloride solution to hold the oxychloride in solution, and, as through gradual dilution this power suffers attenuation the separation of oxychloride progresses until exhaustion is attained when down comes such balance of zinc in the form of oxychloride as the weakened acidity of the solution can no longer hold dissolved. The present acidity of the solution must, therefore, be looked upon as the only reason that all of the zinc is not thrown out in preparing clear zinc chloride solutions by dissolving or diluting with water.

That this acidity must be sufficient, though not necessarily of a related form, was proven through a fortunate thought which occurred just before finishing the work upon these tests, namely, zinc chloride can be dissolved in a well charged carbonic acid water, without residue of oxychloride, and further evidence that acidity is the essential was shown by the fact that if this same solution is boiled or agitated to expel the carbon dioxide, the insoluble oxychloride appears. Boiling caused its immediate separation, agitation revealed it but slowly, while quiet maintained a clear solution for over four days, when afterwards the application of heat caused the escape of a few bubbles of gas, and the looked-for precipitate appeared. But for its fleeting nature, what could be better for our need? That there may be a trace of oxychloride yet held in solution by the combined acidities of the zinc chloride and free acid which have ever enveloped it, would be difficult indeed to prove, but it was proven that a clear solution of zinc chloride of greatest strength possible will not dissolve oxychloride which has been previously separated from a solution. A portion of the cold, clear concentrated solution of zinc chloride was mixed with a small amount of zinc carbonate without change in appearance, but upon boiling the mixture the zinc carbonate dissolved. Even after no more carbonate would be taken up the solution retained its power to redden litmus. On the other hand, a clear solution of zinc chloride from which oxychloride has been completely separated by sufficient dilution, did not dissolve zinc oxide or carbonate, even upon prolonged digestion with heat, thus indicating that in this dilution the affinity between the zinc oxychloride and hydrochloric acid as a balanced condition within the solution is greater than between the zinc oxide and hydrochloric acid.

The liquid which was placed upon the water bath was evaporated to nearly constant weight. It was now in the form of a thick, syrupy liquid, for zinc chloride cannot readily be dried on a water bath under atmospheric pressure. Besides,

what moisture it retains this syrupy residue would be expected to also contain the hydrochloric acid from the reaction producing the oxychloride from which it had been filtered; later it will be shown that it does contain this hydrochloric acid.

Two series of experiments, with this syrupy residue, were arranged. In the first of these it was mixed with water gradually added and finally increased to a considerable bulk to find that it dissolved clear throughout. It was then re-evaporated under the same condition to a syrupy consistency and again found to dissolve clear; a third such treatment was given to it, and a third time it dissolved clear. The reason for its doing so was the presence of a sufficient amount of said hydrochloric acid, tenaciously retained throughout the evaporation, to effect solution, as was proven to be the case by treating the syrupy liquid of the second series of experiments with zinc carbonate. When put into the syrupy liquid the zinc carbonate made no demonstration of the presence of acid until the mixture was thinned with just sufficient water to permit of enough motion for reaction. Effervescence then took place with the disappearance of the small amount of zinc carbonate which had been added. More zinc carbonate was now added until in excess, and the solution warmed, gradually but abundantly diluted with water, and filtered. The clear liquid would now be considered as containing no free hydrochloric acid. Next, it was evaporated to a syrupy consistency on a water bath, and then mixed with water as had been done in the experiment just preceding it. Instead of dissolving clear as the preceding one, the present experiment gave with the first portion of water a clear solution but upon further dilution an abundant residue of oxychloride. This was separated and the filtrate evaporated as before, and upon treatment with water gave a clear solution, thus showing that the acid which was produced in the solution, along with the oxychloride was sufficient to redissolve all of the zinc chloride. Another evaporation and solution substantiated this opinion. The liquid of the first series was now evaporated for the fourth time, and after it had reached the syrupy consistence, the vessel was placed over a direct flame, and the heat continued, while tests were made from time to time, by removing a drop with a glass rod, until a point was reached when the drop gave a turbidity with water. This stage was not attained until after and in succession the last trace of moisture which had been held so tenaciously by the zinc and the adhering hydrochloric acid had been driven off and the zinc chloride had been liquefied by the heat, giving additional evidence that adhering hydrochloric acid had been the reason for this syrupy liquid persistently dissolving clear. The fused residue was now treated with an abundance of water and the mixture filtered. This filtrate was evaporated to a syrupy condition as before and found to dissolve clear in water. Another fused mass corresponding to that just described was treated with a limited quantity of water and upon filtering, evaporating and again diluting, oxychloride separated, because when the mass was treated with the limited quantity of water not enough water was present to adjust the acidity so that the full production of oxychloride might take place. The insoluble portions of the fused masses were all shown by tests to be oxychloride.

In order to observe a specimen of zinc chloride which had never been in a solid state and thus avoid oxychloride due to overheating, a concentrated solution was prepared by saturating warm hydrochloric acid with zinc oxide added in excess.

The clear supernatant liquid from this mixture precipitated with both hot and cold water and in all respects corresponding dilutions behaved exactly as those obtained from the dissolved salt. One could imagine nothing more likely to be chemically neutral than this solution prepared by neutralizing the acid with the zinc base, and its precipitation by water must convince the most skeptical that free acid is not only present in every diluted zinc chloride solution prepared with water alone as the solvent, but also needed to insure complete solution.

Neutralize such diluted solution in part, and simultaneously with the precision of natural law readjustment takes place between the zinc chloride and the water present, with the formation of oxychloride and the production of a corresponding amount of free acid; there will be free hydrochloric acid in a diluted solution made with water alone while there is zinc chloride left in it.

Any amplification of these experiments will but reiterate the proven fact at first but inference—that when this dilution is reached there has been formed and retained enough hydrochloric acid sufficient to re-dissolve the residue in any amount of water that may be added.

So much for our study of zinc chloride under the conditions of ordinary manipulation by the pharmacist, and like every definite chemical substance it always behaves the same under identical conditions no matter how often they recur. And still the problem—to get zinc chloride into solutions of such strength as ordinarily called for in prescriptions, without loss—remained unsolved. Left as we were to make the best of what cannot be changed, one might decide, and with sanction of authority, as previously pointed out, to prepare a solution of zinc chloride and ignoring the slight precipitate, ascribe to it an approximately definite strength and of this take sufficient quantity as needed. Such course is perhaps the next best plan to getting the zinc salt entirely dissolved, but the accomplishment of the latter was what had prompted the work; and yet meditation seemed to be but closing the door to possibility.

While reviewing numerous experiences with zinc chloride in prescription work, it was thought that there was a possibility of boric acid being the agent sought. It had been used a great many times in eye-washes with zinc chloride but had never been depended upon for solvent effect. Its suitability to eye-washes and its mild acidity, however, strongly urged a trial, and the first experiment showed that it has the very property desired, while subsequent trials established the fact that boric acid will give clear solutions with zinc chloride, grain for grain, in any dilution, hot or cold, up to about twenty grains per ounce. Boric acid applied to the zinc chloride will prevent the precipitation of zinc oxychloride; it will also redissolve a precipitate of oxychloride, although proportionately more is then required than is needed to prevent the precipitate. A saturated solution of boric acid is a convenient form in which to employ the agent, adding it directly to the zinc chloride, or the reverse. Saturated solutions of boric acid at ordinary indoor temperatures contain about twenty grains of boric acid to the fluid ounce; these solutions will dissolve an equal amount of zinc chloride. If such concentrated solutions of zinc chloride are exposed to a lower temperature, they become cloudy, peculiarly so, and though cleared by warmth they do not retain their transparency.

Solution by means of boric acid may also be accomplished by mixing the boric acid intimately with the zinc chloride before the aqueous solvent is applied. This plan involves some allowance for the slow solubility of the boric acid itself. Solutions of zinc chloride by means of an equal amount of boric acid are permanent, with the exception of the saturated solution as already mentioned. Less than an equal amount of boric acid does not appear to insure permanency.

The limit of solubility of boric acid is the only shortcoming of this agent so far observed. It is of interest to note for subsequent comparison, that upon boiling zinc oxide or zinc carbonate and boric acid together, no zinc enters solution.

While little, if any, objection can be raised to the use of boric acid in this connection, yet because of its limited effect we sought for another solvent less restricted. Attention had been arrested by a reference to the soluble double salts which zinc chloride forms with ammonium chloride, and effort was turned in that direction. The results with boric acid had strengthened the belief that an acidulated medium is essential to the purpose, and associating this thought with the fact that solutions of ammonium chloride are prone to redden litmus, unquestionably through the presence of a trace of free hydrochloric acid, it was undertaken to learn what effect ammonium chloride would have in the dissolving of zinc chloride. Gratifying, indeed, was it to find in the substance a very efficient solvent, and more powerful than boric acid, for applied directly to the zinc chloride one grain of ammonium chloride will dissolve five grains of zinc chloride. If used to dissolve a precipitate of oxychloride an additional amount may be needed, apparently dependent on strength of solution. The solutions with ammonium chloride are permanent.

There would seem to be no objection to the use of the few grains of ammonium chloride which would be needed to prepare an application for a mucous membrane since such parts are constantly saturated with solution of chlorides and likewise inured to the presence of ammonium compounds. Should a very strong solution of zinc chloride be needed as for powerful local effect, ammonium chloride may be depended upon to yield a clear solution.

The possibility of decomposing ammonium chloride in solution with zinc oxide, in the capacity of an alkali or alkaline earth, had not come to mind until now. Upon boiling zinc oxide with a solution of ammonium chloride it was found that the zinc oxide dissolved, of course, with the inevitable liberation of ammonia. Zinc carbonate behaves in this same manner with ammonium chloride. A parallel test with water was made to check up these results against any soluble zinc impurities in the oxide and carbonate. Herein may be considered to abide the solvent effect of ammonium chloride on zinc oxychloride—an effect again attributable to acidity of medium.

Representing the action by the equation $\text{Zn}(\text{OH})\text{Cl} + \text{NH}_4\text{Cl} = \text{ZnCl}_2 + \text{H}_2\text{O} + \text{NH}_3$, ammonia gas might at first be expected to be in evidence. But when it is recalled that free hydrochloric acid is present or producible in a quantity definitely proportionate to the oxychloride to be dealt with, it is readily understood that no ammonia should be evolved, nor was any, as proven by test.

Sodium and potassium chlorides have no solvent effect upon zinc chloride, but ammonium chloride gives a clear solution of zinc chloride in normal salt solution, and so does boric acid.

A sample of zinc ammonium chloride was prepared by adding to a solution of zinc chloride of known strength the calculated amount of ammonium chloride to supply an equal number of molecules of the two salts. Crystallization of this solution yielded a product which was recrystallized to obtain the sample shown at this time. The identity of the product was established by tests.

Zinc ammonium chloride forms colorless, transparent crystals, without odor and having an intensely caustic taste. It is readily and completely soluble in water; the aqueous solution is acid to litmus; the solution remains permanently clear. This salt is not an article of commerce in channels through which the pharmacist trades, nor is its use suggested, for the acquisition of it needlessly increases one's stock, especially since boric acid and ammonium chloride must always be at hand.

Since medicated waters are frequently used in solutions for treating conditions wherein zinc chloride is likely to be employed, some experiments were made to observe the behavior of these liquids toward zinc chloride. Peppermint water was found to act as does distilled water, boric acid and ammonium chloride but yield clear solutions. Camphor water was found to possess acidity sufficient to dissolve zinc chloride up to ten grains per ounce. Beyond that strength camphor water takes on a satiny opalescence due to the separation of microscopic crystals of camphor. The addition of ammonium chloride increases this opalescence. But with or without ammonium chloride these camphor crystals re-enter solution within a few days, or immediately upon the addition of a few drops of alcohol. The samples of rose water at our disposal were neutral to litmus; they did not dissolve zinc chloride completely until boric acid or ammonium chloride was added. A past experience but well remembered, leads us to believe that specimens of rose water may be encountered which will give clear solutions.

Mucilage of sassafras pith did not dissolve the zinc chloride, until boric acid or ammonium chloride was added; but though the zinc oxychloride went into solution the mucilage was rendered cloudy by its contents.

The statement that zinc chloride forms soluble double salts with some alkalis as well as with ammonium chloride was tried out with some of those used in eye-washes, with the following results: Equal parts of morphine hydrochloride and zinc chloride did not yield a clear solution, until ammonium chloride was added. Equal parts of pilocarpine hydrochloride and zinc chloride did dissolve clear. Equal parts of cocaine hydrochloride and zinc chloride did not dissolve clear, without the addition of ammonium chloride; boric acid likewise carried the mixture into solution. Ammonium chloride produced clear solutions when zinc chloride was brought together with morphine sulphate and atropine sulphate.

CONCLUSIONS.

Our conclusions from this mass of experiments and words may be summed up in short as follows: the separation of zinc oxychloride when zinc chloride is dissolved in water is always accompanied by liberation of free hydrochloric acid which remains in the solution; at the same time a loss of zinc is experienced. Both of these objections may be overcome in solutions up to approximately twenty grains to the ounce by the use of boric acid, weight for weight of zinc chloride taken. For solutions exceeding this strength, or for any strength, ammonium

chloride in quantity of not less than one-fifth of the amount of zinc chloride used, will insure complete and permanent solution. Camphor water will dissolve a few grains of zinc chloride per ounce. Carbonic acid water may be employed if intended for immediate use. And finally the comparative ease with which a minute quantity of either boric acid or ammonium chloride prevents a precipitate as against the larger quantity needed to redissolve oxychloride once formed may be impressed upon our minds by the wisdom of the maxim: "An ounce of prevention is worth a pound of cure."

THE MANUFACTURE OF ASPIRIN TABLETS.*

BY ROBERT C. WHITE.

The data presented by the author are based on his investigations of Aspirin tablets of American manufacturers, including also the original Aspirin tablet. No report is made on the content of aspirin, but only of the tests involving the physical operation of making the tablets. The author states that manufacturers are constantly improving their product and as the tablets reported on are of different dates of manufacture, no names of manufacturers are given and the tablets are referred to by number. The table following has been prepared from Doctor White's report in order to condense this matter; that which follows thereafter is printed from the original.—EDITOR.

The manufacture of Aspirin tablets may be placed in what is considered by manufacturers the "delicate" group. Many things coming in contact with aspirin can exercise either physical or chemical function, and so either contaminate or break down the aspirin content. In the manufacture of any tablet there are several important features to which the manufacturers give considerable atten-

EXAMINATION OF ASPIRIN TABLETS.

Sample No. 7, examined June 1918: Purchased in a Washington, D. C. drugstore. Name of manufacturer could not be obtained. Had evidently been heated too long in drying, with apparent contamination. The edges were poor, and the tablets quite mottled as if too dark a shade of talcum had been used. This sample was so far outclassed by those of other manufacturers that it is of no interest whatever except that it tends to show that very poor workmanship in pharmaceutical products still is practised.

tion. The first desirable thing is to present in tablet form the chemical as nearly in its original condition as is possible. The second important thing is disintegration, though in the case of aspirin this is not vital as it takes, according to various authorities, about forty minutes for aspirin to become decomposed in the gastric fluids.² The next feature is to have present as little foreign ingredient as is possible. As we know, there are many tablets such as formin, potassium iodide, sodium chloride, sodium bicarbonate, potassium permanganate, sugar, etc., which if obtained in granular form of the proper size may be compressed without the use of any excipient, or binder, without the presence of any filler, and without the addition of any disintegrating agent whatever. The physical properties of aspirin are such that it is placed in a class of tablets known to some manufacturers as moist tablets. This class includes such tablets as quinine, acetanilid, etc., or tablets which can never be produced with a glass-like surface. The term moist in this case originated with the appearance of the tablet which no amount of blowing, or dusting will make entirely smooth. Such tablets, if great pressure is applied are inclined to cap, or on account of their sticky surface allow small particles to adhere to the punches, thus leaving dents in the surface of the tablet. This to the manufacturer is known as "picking," meaning that the punches pick off a small particle, leaving a cavity in the tablet. It will be readily seen from the physical properties of aspirin that it is necessary to have present a binder, or ex-

¹ Tablets on account of excessive pressure used in manufacture would not disintegrate speedily enough, yet their fracture was soft.

² (U. S. Dispensatory, 20th Edition.)

cient. Sugar has not proven satisfactory for this purpose, as sugar itself attracts moisture, and complicates the operating of a compressing machine. It must also be remembered that moisture decomposes aspirin, and its presence in large quantities is highly objectionable, therefore the excipient must be one that can be dried very readily and that, at a low temperature. Glucose, gelatin and tragacanth all fail to answer on account of their sticky and slow drying qualities. Honey would not answer, as its tendency is to darken white tablets, and the need of much filler makes it unsuitable. Water alone will not bind properly. Solution of acacia answers fairly well, but both starch paste and acacia are lacking in making a fine aspirin tablet. It will, therefore, be found that a weak solution of white dextrine in combination with a filler of starch answers better than any other excipient for producing a mass of aspirin for proper granulation. It might here be explained for the information of the uninitiated that except in extremely rare cases it is never possible to compress powders of fine degree, but that granules must be built up from the powder.

Another feature involved in the preparing of an aspirin mass or mixture is that it must not be exposed to contamination from metals. From the samples examined it is evident that some of these have been manufactured in the ordinary iron mixers, or if granite-ware containers have been used, the surface has not been perfect, and iron has been exposed. If this is not the case the moist mass, before drying, has evidently been forced through a brass or an iron screen, which has produced contamination and resultant discoloration. In this particular product the writer has found nothing more satisfactory than the mixing of the aspirin ingredients in a special wooden tub made of maple. The operator may mix the dry ingredients through a properly protected powder mixer, but the addition of the dextrine solution must be made in these wooden tubs, the operator wearing long rubber gloves. Care should be exercised in all cases that the minimum amount of moisture for the best results to be obtained shall be strictly adhered to. The finished mass taken from these wooden tubs should be forced very quickly through perfectly clean and well tinned screens, placed immediately in aluminum trays, and dried *in vacuo* at a temperature not exceeding 120° F.

It will be found if all these rules are observed to that aspirin may be dried in three or four hours. If during this time the aspirin has not been exposed to the air it will be found that the granulation, dry and ready for compression, is in proper condition to be placed on the presses. No oil should be added in the running of aspirin tablets unless absolutely necessary on account of weather conditions. It will be found that though on account of the absence of oil the sides of the tablets will not be bright and polished (due to the moist physical properties of the ingredients as was spoken of earlier) the edges will be sufficiently smooth for all purposes; and the absence of the oil (which would in time penetrate the tablet) will permit of a harder tablet.

A minimum amount of pure white talcum, not exceeding $\frac{1}{8}$ grain to the tablet must be used as otherwise picking on surface of the tablet will occur. If the engraving of monogram punches is very fine it will be necessary to increase this amount of talcum in order to prevent the material from sticking in the engraving. It should be borne in mind that talcum is objectionable in all cases and as little as possible should be used.

As speedy disintegration of all tablets is considered essential, a disintegrating agent must be used. Doubtless, known to many, potato starch is the disintegrating agent par excellence as it swells very rapidly and ruptures a tablet very quickly when it is introduced into aqueous solution.

The following criticisms in general might be based on the aspirin tablets at present supplied by all except one or two manufacturers: that many of them are off color, some having unquestionably been subjected to contamination. Corn starch has been used by many in preference to potato starch; the excipient used by some is also too heavy and too slow drying.

The nature of engraving used on such monogram punches as have been operated in making aspirin tablets is not of a proper make to use on tablets of such dusty physical appearance. Others through not using a proper disintegrating agent have compressed the tablets too hard which makes them too brittle for carrying. In other cases, to permit of speedy disintegration, insufficient pressure has been applied.

In behalf of the tablets examined, however, the writer would like to state that the disintegration in general has been exceptionally good, the discoloration only moderately bad, and that while the appearance of most of the tablets is poor, it is undoubtedly preferable to sacrifice physical appearance for efficacy in all cases and when all is said and done it is quite probable, too, that though these matters are of considerable importance to manufacturers, the retail druggist may be in a position to inform us that the public are not sufficiently educated in such details, and may prove to us that the poorest looking tablet is the best seller of all.

WHAT IS THE MEANING OF A DEGREE IN PHARMACY?*

BY L. E. SAYRE.

It will not be the aim of this paper to extol pharmaceutical degrees, or make a plea for their standardization or unification, but rather to suggest for consideration the importance of some questions indirectly associated with degrees.

The desirability of unification and standardization of degrees in pharmacy has been ably presented at former meetings of this Association by prominent members and instructors in pharmacy. Professor McGill, of Nashville in 1904¹ very ably set forth what was then considered as needed to bring about greater uniformity. It may be in place to review briefly his paper. His statistics were gleaned from 48 schools and colleges of pharmacy. He found among these institutions the following degrees conferred: Graduate in Pharmacy, Bachelor of Pharmacy, Master of Pharmacy, Doctor of (or in) Pharmacy, Bachelor of Science in Pharmacy and Master of Science in Pharmacy. To show the lack of uniformity he cited statistics to show that the degree of Ph.G. was conferred for work ranging from 40 to 72 weeks. Greater uniformity was found to exist in the requirements leading to the degree of Ph.C., but in the Bachelor of Pharmacy, Master of Pharmacy and Doctor of Pharmacy much incongruity existed. For

*Read before Section on Education and Legislation, A. Ph. A., Chicago Meeting, 1918.

¹ Proceedings A. Ph. A., 1904, p. 115.

example, the title of Doctor of Pharmacy in two cases required five years' study and presentation of satisfactory thesis and one case where 2 years' work was required after taking Ph.C. degree, or one year after taking the Ph.M. degree, while the title of Doctor of Pharmacy was conferred by two schools as their only degree, presumably for the regular two years' course.

Doctor McGill remarks "It will not be many years before no reputable college will dare to confer the degree of Bachelor or Doctor upon a candidate who has not taken the baccalaureate degree," or its equivalent.

Last winter, at a meeting of the Association, representing the institutions of higher learning, a motion was offered to be acted on at a later meeting—which, in substance, is intended to discourage and even prevent the recognition of academic degrees for work below that generally recognized as requisite for the baccalaureate degree. Doctor McGill, thirteen years ago at the annual meeting of this Association, deplored the fact that these degrees in pharmacy were sometimes conferred upon some who had not even a high school education and when professional training was limited to a short course in a few branches of science pertaining to pharmacy. He asks: "How does the world regard this practice?" The answer of the academic world seems to be fairly well crystallized in the action proposed to be taken by the association referred to.

Twenty years ago there was some agitation favoring the title of Doctor for the pharmacist but making this worthy of recognition by adequate training through a proper curriculum. H. R. Slack¹ suggested that this would elevate the standing of the pharmacist as well as the teaching of the profession. Mrs. Mallory Taylor aptly says that the old proverb: "People will live up to their clothes" is applicable; their mental and moral barometer will rise and fall accordingly. She advocates a professional suit for the pharmacist. She gave her impression of her professional status when she said, speaking as a druggist: "We belong to the threadbare class." These sentiments expressed twenty years ago by one from the ranks of the practical druggists, are considered by some of the same class of to-day, as sentiments characteristic of the "theoretical harp stringers" or "the scientific flute players"—otherwise called "professors." Be this as it may we are thankful for the many who have still high respect for the calling and have the courage, against odds, to make every effort to elevate it.

College degrees have an important bearing and meaning to the student, his instructors and others interested in him and his calling. Some eminent educators have said that it would be a good thing if we could abolish college degrees altogether; if we could have knowledge and training sought for its own sake rather than the prize supposed to be embodied, or inherent in prize, but it appears that we have to take human nature as we find it. In student life there are at least two incentives—the knowledge itself and the prize which we name the degree conferred. Of the two incentives the former, to the ideal student, is the chief incentive, the latter quite subordinate. The magic influence enveloped in the idea of degree may be accounted for partly in its historical connection. Academic scholarship as early as the 13th century, was rewarded by the conferring of honorary degrees. A body of statutes was adopted for the University of Paris wherein the term Bachelor,

¹ Proc. Am. Pharm. Assoc., 1897, p. 356.

Master, and Doctor has appropriate recognition, standardization and restriction. The underlying motive in these statutes, succinctly stated, being the upbuilding of civilization through training and scholarship, which were, in a measure, standardized, an effort to accomplish this was stimulated. These motives and these ideas in the 20th century still cling to the meaning as well as the purpose of degrees. Pharmacists have appropriated and practically applied this time-honored method of stimulating scholarship as evidenced in the numerous schools and colleges which have been established through their combined efforts, the vitalizing factor in the whole system being the advancement of scientific pharmacy. The result has been that we have a wide distribution of pharmacists who have been not only well trained but who have the true scientific spirit—pharmacists of whom the professions—medicine and pharmacy, as well as the public, may well be proud.

But it is a fact to be deplored that there has grown up, beside this scientific spirit, an opposing one, one that has been characterized as the modern spirit in pharmacy, the extreme advocates of which would do away with schools, degrees and all restrictions, would even dispense with the drug store itself except for exploitation—merely using its name for trade purposes, as if pharmacy had no rights that should be respected. A gentleman, interested in medicine and in pharmacy as well, said to me that these modern stores, masquerading as pharmacies, would soon put the real pharmacist out of business if the pharmaceutical profession did not protect itself against the invasion. It seems to me that we have come to a time when not only the pharmacist should be standardized but also the drug store. That is, in addition to demanding a definite professional training on the part of the pharmacist, the public, by law should demand a certain minimum of equipment in the way of stock, apparatus and prescribe and define the conditions under which alone the dispensing of drugs can be safe and accurate, such as character and quantity of stock, cleanliness, care of apparatus, etc., etc. In this direction in some countries legislation has gone so far in detail as to require that a licensed drug store must possess, for instance, "a balance that will have a delicacy that would turn by the weight of a milligramme. It was only through some very meager restriction of this sort that Kansas through legislation was able to drive out the saloon keepers masquerading as druggists—the stock of a drug store was defined, to protect the real from the spurious. I do not mean of course that, in order to meet requirements such as to protect the good name of pharmacy the druggist must needs renounce "side-lines" and "sundries"—those in which he may find scope for his business ability and enterprise, but while he may have free scope here let him, if he attempts to perform the service of a pharmacist, do so with a show of equipment, at least, and display some respect due the vocation of pharmacy.

The medical profession, partly through outside pressure, has had new life breathed into it by having a higher professional standard urged upon it. It is needless to say that practitioners of medicine welcomed this outside pressure through the Carnegie Institution, and pharmacy might well invoke this same assistance to bring about a better respect for itself. Our colleges and schools must have the courage to blaze the trail. It would be fine, indeed, if we could broaden our minimum college courses, taking systematic courses in bacteriology and biology for example, which are becoming more and more necessary, adding another year of 40 weeks as Ann Arbor has done to the pharmacy course.

I have pointed out that there are those in our own ranks who would abolish the drug store except for the purpose of exploitation. There lurks in other quarters, without our company to-day a small, influential, honest, but totally misinformed class of medical men who would go so far as to abolish pharmacy altogether. Modern medicine, they claim, has so little of medical therapy in it that the drug store, especially the modern type, is entirely superfluous in our communities. To them pharmacy is synonymous with ignorance and humbuggery. Pharmacy schools give only smatterings in their courses; little value, if any, is attached to the name of pharmacy. This class doubtless is one among those who are opposing the recognition of a pharmaceutical corps in the Army. Of course these medical men forget, if they ever knew, that all that is modern and worth while in therapeutics to-day, even the small part they find themselves compelled to employ in their practice is not the product of medical men themselves, but very largely indeed of pharmacists, chemists, and scientists not connected with the practice of medicine. Who but the pharmacist, directly or indirectly, has evolved the numberless concentrated principles, biological products, the hyperdermic tablet, suppository, the glass pearls, gelatin capsules, the sterile syringe, to say nothing of a host of other remedial agents and their standardizations practitioners employ?

Pharmaceutical research—its direct and indirect bearing upon Medical Science, needs to be put forward! Medical men need to be told that all that belongs to Medicine has not originated with them or the profession they represent. We need young men of high degrees of scholarship to speak for pharmacy. As Mr. Hendrick says of the chemical profession—"It needs to be properly advertised!" We need young men trained to make valuable contributions to the healing art and to show that all creative art and skill does not reside in the one profession. It takes men well trained to do this—to drive the lesson home that we may guard what is justly ours. The college degree is surely one of the means to this end.

One of our prominent pharmacists, in a recent article, seems impatient of our schools that teach so much science, and that they pay so little attention to the fact that the druggist "has to pay his rent" and only once in a while has to figure out the difference between an atom and an atomizer. If such an implied pessimistic view of pharmacy should prevail, pharmacy might wisely agree to abandon degrees, and all restriction, and surrender itself completely to department stores, then there would be no meaning to, nor any more need for a degree for the pharmacist than for the grocer's clerk.

If the aim of this paper, wandering as it is, has not been made quite clear, that aim may be stated in a short closing paragraph.

Nothing portrays more keenly the spirit of pharmacy than those who reflect this spirit in word and deed. What are we doing to create and uphold the proper spirit? Any one who cynically criticizes the profession of pharmacy is doing his bit in chanting what may end in the requiem of that profession. We are thankful for constructive builders, for those who are eager to help in building our time-honored profession. Some do not know how, but do not oppose, nor indulge in the foolish pastime of trying to minimize or even nullify the work of those who are active in constructive effort. May the efforts of the latter grow less and less apparent.

THE CHEMICAL LABORATORY. SIDE LIGHTS IN ITS MAKING.*

BY FREDERIC E. NIECE.

Prior to the present conflict, there hung in the Louvre at Paris an interesting picture, depicting in a most realistic fashion an alchemist at work in his sixteenth century laboratory.

The painting portrays a low, dingy basement, showing furnaces arranged here and there, which have in later years been transformed into our modern vapor chambers.

On the floor, scattered about this aged creature, may be seen many crude looking implements of the time. Closer observation reveals some worn-out alembics, charred and time-worn crucibles, scarred and battered retorts, mortars, pestles, and whatnot. Suspended from the ceiling one may see huge specimens, representative of prehistoric times. Huddled about the strange, old, gray-haired figure is a group of intensely interested students. Their facial expressions and inclining attitude foretell amazement, as they watch each move the decrepit exponent of alchemy makes. Their attention seems to be completely absorbed as they appear to listen with the closest order to each word the old man utters in explanation of each step in the obscure process which, as they hope, will lead to the creation of the proverbial "philosopher's stone:" the "ancient stone" to which is alleged the ever ready power(?) to transmute the baser metals into gold—the noblest of all the noble metals.

It also appears that he is divulging to this select few, with the greatest minutia, the secret involved in the search for that "Priceless Elixir" with eternal virtues that are so conducive to that much envied desire of "long life."

The entire make-up of the picture is one of absorbing interest and seeming seclusion, for apparently there is no desire to publicity, as the old, bent-over creature, in his own manner goes on with his vivid portrayal as to how it shall all come to pass. But as centuries have come and gone we have earned to realize how vain have been his hopes but how fruitful have become his efforts.

Too true has this since become, for it was upon this very crumb of an ill-founded tradition and mistaken belief that the foundation of a most wonderful institution was first laid—an institution small and poorly conceived in its beginning, but large, spacious and indispensable in its completion.

Thus we can picture in our mind's eye, if we will, the inception and creation of our modern chemical and pharmaceutical laboratory, embodying as it were a series of trials and tribulations by reason of its associations with misguided theories—a struggle for existence in the face of a most fantastical opposition; and its triumph, because of its proven virtues in spite of the most adverse circumstances. In a measure the labors of these early workers were not entirely all in vain. No, for aside from their ignorance, superstition and lack of proper training, their reward has been great, for they gave the laboratory its impetus and to-day we find it a most powerful factor in both our scientific and commercial worlds.

The very thirst for knowledge by these poorly advised creatures was the making of all that the present-day laboratory implies.

* Presented to the Section on Historical Pharmacy, A. Ph. A., Atlantic City meeting

Many of the results, as we have studied them, from the dark ages up to and through more recent centuries, have changed but little, while years of toil may appear to have resulted in the waste of time, the loss of money and the sacrifice of patience, have, by persistency of purpose, turned impending failure into lasting success, notwithstanding the hardships attending the efforts.

How true this is can be no better realized than in the experiments of Archimedes over two centuries before Christ. His method of detecting metals by their specific gravities has not changed in principle, only in application. So we may gainsay, that these earlier workers and the workers of the middle ages left a soil so fertile that those who took up the tilling where they left off gave us as a result much good ground in which to develop our own abilities. By virtue of all this there was born out of it many whose lives have been guiding stars in the firmament of experimental research, an inestimable heritage of scientific wealth.

Take for instance the immortal Justus von Liebig; the great investigator, Davy; the ill-fated Lavoisier; Dalton, of atomic theory; Bunsen, Wöhler, of organic chemistry fame; Priestly, the discoverer of oxygen; Cavendish, of hydrogen; Ramsay, of metal transmutation fame; and the Curies, with their discoveries in radio-activity; Pasteur, Ehrlich and others,—all of these and many others were little thought of, much less their achievements, until their efforts were confirmed in the physical or chemical laboratory and the results thereto thoroughly established and thus given to the world. To the laboratory of whatever purpose, we owe much for that which it has done it has done well. It has been instrumental in not only revolutionizing industry but creating many new ones. It has caused a better people, a greater nation and a safer world.

Liebig, in addressing the British Association for the Advancement of Science, in 1852, said:

"One of the most remarkable features of modern times is the combination of large numbers of individuals representing the whole intelligence of nations, for the express purpose of advancing science by their united efforts of learning its progress, and of communicating new discoveries. The formation of such associations is of itself an evidence that they were needed. It is not every one who is called by his situation in life to assist in extending the bounds of science; but all mankind have a claim to the blessings and benefits which accrue from its earliest cultivation. The foundation of scientific institutions is an acknowledgment of these benefits and this acknowledgment proceeding from whole nations may be considered as the triumph of mind over empiricism. Innumerable are the aids afforded to the means of life to manufacture and to commerce by the truths which assiduous and active inquirers have discovered and rendered capable of practical application. But it is not the mere practical utility of these truths which is of importance. Their influence upon mental culture is most beneficial and the views acquired by the knowledge of them enable the mind to recognize in the phenomena of nature, proofs of an infinite wisdom for the unfathomable profundity of which language has no expression."

But let us now reflect a bit and learn a little of laboratory appointments and surroundings during a time when some of the epoch-making discoveries were formulated. Strange to state, the conditions of our earlier laboratories were deplorable even up to the latter part of the last century.

A number of the greatest scientific achievements have been attended with the crudest form of laboratory equipments imaginable, and under the most trying circumstances.

Perhaps this condition of affairs was largely responsible for their successful development.

A few interesting episodes in this connection taken at random from many sources will clearly show to what extent it was necessary to go in order to accomplish that which the investigator set out to do.

The early day scientists had no easy road to success, for they toiled in rooms and shops far from luxuriance and accommodations.

The earliest record we have of chemical laboratories is that found in the days of the Egyptian Pharaohs, where the temples had adjacent buildings presumably for chemical operations, since the hieroglyphics found written on the walls of these buildings point to the use of assaying, coloring and annealing processes.

Sir Robert Boyle, the father of modern chemistry, while investigating the "elasticity of gases," and who developed the law which now bears his name, used a tube of such length that he could not conveniently employ it in his laboratory room. He was therefore compelled to continue his delicate experiments by the use of the stairs in the same building.

It is also given from reliable sources that Newton performed all of his work on the "resolution of the light rays" in his lodgings at Cambridge. Our own but immortal Franklin, it is said, did most of his work at home by putting up insulated rods, seizing every chance he could to apply his tests when the air was heavily charged with electricity.

With Berzelius, who gave us many shining lights, matters appeared to be very homelike, for it is common talk that he carried on most of his experiments in the kitchen of his home where, it has been said, "cooking and chemistry went on together."

In the year 1824, Justus von Liebig, the founder of the modern chemical laboratory, established his laboratory at the University of Giessen. Its description was that of an old, dilapidated wooden structure, which was given him for the purpose of performing his experiments. Here he carried on his researches and taught students at the same time.

In this manner the question of agriculture was successfully given a scientific basis. The value of his labors has never been fully appreciated but perhaps realized for the wonders it has worked in the interest of crop productions. With Lord Kelvin things seemed to have improved but very little; for many years his laboratory was an old unoccupied wine cellar in one of the old university buildings at Glasgow.

In Lord Kelvin's physical laboratory experiments were conducted which made possible the laying of the Atlantic cable.

Claude Bernard, who has been termed by many "the prince of experimenters," toiled daily in an old damp cellar, one of those wretched Parisian substitutes for a laboratory which existed even up to but a few years ago in some remote places. Bernard gave it the appropriate calling of "The Tombs of Scientific Investigators." The case of Gay-Lussac was very much the same, and in some respects both serious and yet comical. Gay-Lussac conceived the idea of wearing wooden shoes to protect his feet from the dampness of the cold ground. It is reported that he suffered severely with rheumatism, hence this novel means to enable him to continue his experiments without discomfort. It was Gay-Lussac who gave us Liebig.

This is a fairly good taste of scientific research under difficulties and reveals

a most worthy example of persistency that is beyond comparison. Such characters must have surely loved their work for there can be no doubt but what Gay-Lussac did. In a few unappointed, squalid rooms in Berlin, we are told, that H. G. Magnus taught and performed experiments to students from whence came such geniuses as the great Helmholtz and the famous Tyndall, the one-time railway engineer but later on a student under Bunsen.

At the *Ecole Normale*, situated in the *Rue d'Ulm*, just in the rear of the Pantheon, Paris, in close proximity to the Sorbonne, in a small one-story building, Pasteur made some of his famous discoveries. At first he had only one small room, but the place grew with his achievements until he occupied the entire building.

Dr. Roux, famous for his discovery of diphtheritic anti-toxin, did some of his best work in a very small room in the same building. He had not as much as a fireplace with which to add warmth and comfort to his surroundings.

Another was Louis Thuillier, after whom Rue Louis Thuillier was named. Though only a student, his bacteriological researches in the same building made him famous and caused a tablet to be erected in his memory for the self-sacrifice he made in the cholera epidemic in Alexandria. This unpretentious building containing, as it did, the laboratories of such great men, was given the name of "The Mecca of Bacteriologists."

Thus we have a reflection of the evolution of the laboratory in another direction.

In a once private dwelling two rooms were set aside as a laboratory at Heidelberg in the year 1846, by Prof. P. G. Jolly. Here was laid the cornerstone of the more modern laboratory. It grew in size and enlarged in accommodations to such an extent under the supervision of Bunsen and Kirchhoff that their wonderful observations with the spectrum was thereby made a possibility.

One of the more recent cases and strangest of all was that of the Curies, who worked on radium. It has been given in print that the Curies developed radium and studied its properties under the greatest difficulties. The laboratory of Pierre Curie was situated in the school where he taught physics—"a small, single room, an inconvenient workshop and extremely unsuited for serious investigations, in fact almost unusable."

At the school of physics and industrial chemistry, where all of his researches on radium were made, "the installation was a miserable one, consisting of barracks made of boards loaned by the city of Paris." "The room used for physical experiments was smoky, low, dark, moist and cold." "It had none of the conveniences necessary for carrying out delicate experiments and had no plant for furnishing electric energy, heat or high temperatures." "As for the chemical laboratory that was more than ancient."

"In the large glazed shed there was to be found two plain modern tables for holding flasks, capsules and furnaces. On these tables all chemical operations were performed. There was no hood to carry away vapors, and every time there was a chemical reaction the room was filled with fumes that made the air irrespirable, so poor was the ventilation."

Lastly, Curie had no laboratory assistant other than his ambitious wife, who was before her marriage to Prof. Curie, Marie Sklodowska, a Polish girl, who shared with him in the greatest of all recent chemical discoveries, that of radium.

I am advised that only a few years ago was there much improvement in their laboratory surroundings, but owing to the importance of their discovery, the University of Paris enriched its laboratory equipment by installing more modern appliances.

As a reward to this noble little woman, the University of Paris tendered her the chair of radio-activity, which she accepted and, by the way, is the only professorship in that institution occupied by a woman.

In 1903 she shared with her husband half the amount of the Noble Prize awarded for work in physics. A few years later she was personally awarded the full prize for her work in chemistry. The research and experimental laboratory has grown to wonderful proportions within recent years, both on this and the other side.

Every institution of learning, regardless of the size, has some form of laboratory equipment connected with it. On the other side the laboratory constitutes one of the most important divisions of any institution needful of one, be it educational or industrial. Switzerland is not a very rich country, comparatively speaking, but Zurich boasts of its laboratories that have cost over 4,000,000 francs.

Germany's physico-technical laboratories, to which Werner Sieman has himself subscribed several hundred thousand dollars, are perhaps the most complete in the world. These were established in the fall of 1887.

In this connection consider the most beneficent gifts of Mr. John D. Rockefeller, of this country, to that of the research laboratories which bear his name. The Institute for Medical Research, under the able direction of Dr. Simon Flexner, is truly an institute of laboratories, to which Mr. Rockefeller has already given upwards of \$12,500,000, which makes it the most thoroughly appointed institution of its kind in the world.

Editorially the *New York World* had this compliment to pay with reference to this most amply endowed medical institute:

"The achievements of the scientists engaged in its work had already made it one of the most useful and most famous. Some of them, indeed, have by their discoveries so advanced the sum of human knowledge concerning the causes and the nature of diseases as to have gained rank among the foremost of the age. It is therefore not merely wealth but science and genius and keen discerning labor that Mr. Rockefeller has by this disposal of a portion of his fortune placed at the service of human suffering."

The various laboratories of Cooper Union, New York City, where the penniless but ambitious boy, native or alien, has an equal chance for a scientific education with that of the richer in paid institutions, was made possible by the keen farsightedness of its benefactor, Mr. Peter Cooper.

This is the only institution of its kind in America, and perhaps the entire world, that came into existence and accomplished so much under circumstances most unusual.

Cooper Union maintains a high standard of education, which is advancing yearly. It occupies very expensive realty quarters and is independently supported. All of this has been amply provided for by its founder, Mr. Cooper. Its chemical laboratories alone are modern and spacious, completely equipped and efficiently managed by a corps of experienced instructors, many of whom have risen from the ranks.

From a small beginning the laboratories have grown to very large proportions, and during the last ten years have undergone many notable changes, so that to-day the chemical department stands as a most unique part of the entire institution, which is unsurpassed by any other of a similar nature.

Information leading to laboratory knowledge in chemistry, botany, physics and the biological sciences, is now being taught by mail by the extension department of the University of Chicago.

The laboratories at Glasgow now occupy palatial quarters in the new building of the university, where great prominence is given them.

The new medical laboratories of the University of Pennsylvania, costing over a half million dollars, are marvels to behold. Likewise, the various laboratories of Columbia and Johns Hopkins Universities are most modern and up-to-date.

Conceive the vastness of the laboratory forces of the United States Government as it concerns its Department of Agriculture alone, with over fifteen separate and distinct departments all equipped with laboratory facilities of the very best.

Take that of the Bureau of Chemistry and that of the Animal Industry alone. These are truly wonderful and powerful agencies in the world's economics.

A few others, like the Bureau of Standards, the Hygienic Laboratory of the U. S. Public Health Service, with its tributaries reaching into all parts of the United States. By its creation America has been immensely enriched, and its work conducive to a more healthy nation.

This, too, was not without its bitter trials, for as late as 1901 Congress approved a paltry sum of \$35,000 for a new building for the laboratory on a site in the old naval observatory grounds at Washington.

Even fire and life insurance companies have been specially equipped with testing laboratories. Every asylum, sanatorium and health resort has its laboratory of some sort.

Deprive the various State agricultural experimental stations, the State and municipal boards of health, hospitals and clinics, the medical, pharmacal, dental, electrical and mechanical institutions of their research laboratories and you will then have destroyed the elements of their usefulness.

No private, public or academic institution of learning can dispense with its laboratory outfit.

Industries of every description feel and see the need of specialized laboratory equipments.

More recently, growing out of the European conflict, the United States Government has had in the course of formation one great research and experimental laboratory for the U. S. Navy, which will have a series of chemical, physical, electrical, mechanical and explosive laboratories. The cost of erection is to be \$5,000,000, with an annual expenditure of a little over half the above amount.

The University College of London, realizing chemistry's importance in the future prosperity of the nation, has just completed the construction of a new chemical laboratory that will surpass in equipment anything of a like nature in the entire world. From this alone we are to understand that the research laboratory has become a strong factor in the industrial and economic relations of the universe. What a wonderful picture this would reveal to our old friend, the alchemist, if he were permitted just for a moment to observe its present vastness. What

would be his reply at just receiving a mere peep at the advancements and accomplishments growing out of his efforts these last few decades. Surely he would be amazed into speechlessness.

So we may pay homage to the toilers of alchemy of the "dark ages."

Praise them for their persistency and their desires, hopes and failures, for in a manner we may perceive how the mighty oak of our present laboratory has sprung up out of an acorn of ignorance and superstition.

And yet less than half has been accomplished.

HOW PHARMACISTS' WIVES MAY BE OF SERVICE TO THEIR COUNTRY.*

BY MRS. D. F. JONES.

We all love our country and how gladly have we responded to its call to do our bit, even if there are over twenty patriotic organizations for us to join, each one with an appeal we find hard to resist, we can only live one day at a time to produce the work required, and we must not become discouraged because we cannot accomplish everything.

The Red Cross work should come first in interesting pharmacists' wives, not only because of its close relation to the work of the pharmacist but for the alleviation of suffering at large. Money is most needed for this work, for the work must go on and we must aid in this labor of mercy, not only with money but time and effort as well. The article by Ex-President Taft in the June (1917) number of the *Ladies Home Journal* describes the object and work of the Red Cross so well that it is not necessary for me to repeat it, as everyone should be familiar with the work by this time.

I know of no other class of women more helpful than pharmacists' wives in times of peace, so I feel sure they are responding quickly to the rigid requirements of war. This World's War has made it both fashionable and patriotic to practice thrift which means making the best possible use of all we have in time, money, energy and material, and not trying to spend more of anything than we have. The slice of bread stares us in the face like an ogre and to see it wasted is a kitchen calamity. It would be a greater calamity if we served this same slice of bread once too often, for whatever we do in keeping war away from our borders, we must never let it creep over the threshold of our homes.

Because of our great excess of food we have become extravagant so we are admonished before throwing anything away to stop and ask ourselves the question: "Can it be used in my home or some other home?"

We, as women, are not in a position to play a large part in the actual fighting, but we can play a most consequential part in caring for those who fight for us and for their women and children. This we can do in our own homes and by encouraging and helping others to do so. We must aid the poorer classes in learning conservation, and I am glad we have societies organized to help the people of all classes to aid themselves. It is wonderful how quickly women have responded to this great call to service, and how efficient they have become in all phases of

* Read before Women's Section, A. Ph. A., Indianapolis meeting, 1917.

work formerly done by men. Think of 25,000 women in France working on the railroads cleaning coaches and clambering over engines; and their bosses say their work is done quicker, better, and in a more cheerful manner than the men ever did it.

The Government of France has opened the technical schools for their women and has been an encouragement in every way, while the women of England have been discouraged by that Government and have only received help through private firms. Nothing daunted, they have compelled recognition, for England is a world of women in uniform, an army of nurses, messengers, porters, elevator hands, bank clerks, every place that men formerly occupied.

The women of Germany, so patient and stoical, starving in many communities, demand our praise and admiration. We can profit by their wonderful example and learn from their perfect system of handling these serious questions that are confronting them. They realize what war means and Red Cross work to them is serious business because they are constant witnesses of suffering.

One especially sad thing about the war is the Child Question. Crime amongst children has increased by a large percentage on account of neglect. And right here just a word about the children of our own country—our most vital resource. While the motherhood has been appealed to in women as never before by the pitiful tales of war orphans abroad, it is appalling to see and read of the neglect of children, not orphans, in cases right here at home. Mothers prompted by patriotic impulse cannot afford to spend their time away from home even for a patriotic reason when they cannot account for the doings of their own children. A timely suggestion has come from the Department of Education, that our Kindergartens, Elementary, and High Schools should run to their fullest capacity throughout the entire year. As the fathers are withdrawn from the home and the mothers enter the industrial field, home-life must inevitably be disturbed and home-care dangerously relaxed. To keep the schools open the entire year would be one of the most effective means of unavoidable domestic neglect.

Of course we, as pharmacists' wives, have always been in training, so we can adapt ourselves to unexpected calls on our time and energy. We have always been ready to take the place of the clerks, do the collecting, etc., in addition to home management and child raising, without the aid of servants; so if the call does come for loved ones to join the Pharmaceutical Corps we are ready to step nimbly into the harness and "pull for all we're worth." Meantime we are going to make home-life even more pleasant. We will look after the children, and if Sarah Tyson Rohrer does say it, we will serve something besides the "unsalted dish of rice" she advocates and prepare the appetizing meals our husbands always have liked and through it all use common sense with economy.

MRS. D. F. JONES,
WATERTOWN, S. D.

JOURNAL OF THE MODERN MERCHANDIZING.*

BY LOUIS K. LIGGETT.

In introducing his subject on Modern Merchandizing before the New York Branch of the American Pharmaceutical Association Mr. Liggett traced the history of Modern Merchandizing to John Wanamaker when he established the one-price system. He gave an account of the counter-action of druggists in Detroit to compete with a grocery firm that had added a drug department and established cut prices of patent medicines, by selecting a drug firm to compete with the latter; how the venture proved a fortunate one for the firm selected, Gray and Worcester, and the stimulus to larger sales in many drug stores. Fifteen years ago Mr. Liggett, said, there were not more than ten retail druggists who did a business of over \$100,000 annually and the adoption of modern merchandizing methods has been instrumental in the development. This brought the speaker to the consideration of service in modern merchandizing and the remainder of the address is given as reported.—EDITOR.

"Service to-day is a greater factor in getting volume than price. It is particularly so now and will be so for a considerable time to come, although I do not doubt but that when this unfortunate war is over and the natural depression comes in two or three or five years hence, price will probably then be a factor.

"At the present time Modern Merchandizing consists primarily of *service*. Service is not only in giving proper attention to customers and good salesmanship, but in addition may be defined by having merchandise in stock when your customer calls for it, plus your ability to see that you are not overstocking and that you are turning your stock as often as is expedient with keeping good merchandise in stock. That, to my mind, is the first principle of developing volume. You must back up service with advertisements, either window displays or newspaper advertising; you must back it with merchandizing ideas—advertising something that does not materially affect the drug store but brings people into your store. You can back it with any number of conceivable schemes for getting people into your store, some of which you will find can be overdone if you don't watch them closely, for almost all schemes for getting business simply mean that you are appealing in a novel way to the minds of the people, and you may over-play your hand before you get through. Nevertheless, all of these schemes do boom business.

"There is one other factor in getting volume, namely, location. You could put the most complete drug store, with the finest and best assortment of stock, over on Park Avenue, in back of the Grand Central Station a block or two, and you would starve to death in a few months, but if you put the same store on the corner of Broadway and 42nd St. you will prosper. To get volume you must go where the people are.

"Having started on the road to volume, your next point is to watch and see how much it costs to get that volume. If you are getting it by advertising ideas that are expensive, or by over-clerking your stores so as to render that so-called 'clerk service,' whether you are paying too high a price for the volume you are

* Parts of an address before New York Branch A. Ph. A.

getting, are all things that you have to think of, when the volume starts to come to you. I mention these because they all have an effect on gross profit and hence affect your net profit. Special drives also have an effect on gross profit. Gross profit, after all, is the difference between what you pay for an article and what you sell it for less the depreciation on the articles that you have on hand. You never know exactly what your gross profit is until you have inventoried your business so completely and so fairly in your own mind that there can be no question but that you have made the proper charge-off for your over-stock and your valueless stocks of merchandise.

"I might say right here that in our business of running retail drug stores the most valuable thing we have is the inventory system. We have volume, but it would mean nothing to us if it were not for the check we have on our merchandise. Five years ago not only the Riker business but the Liggett business was receiving in their banks each day from the stores only 95 cents on every dollar's worth of merchandise sold to customers. The other 5 cents was lost in one of three or four ways, either through theft, unreported breakage of merchandise, unreported transfers of merchandise or depreciated merchandise, merchandise that was valueless and was never found to be valueless until a careful analysis of the inventory of each store was taken. To-day operating under very close supervision our shortage average for the first nine months of this year was less than 6.7 of one percent. It means a difference to us in profits of considerably over a million and a quarter dollars at the present volume of business. So you will see there is something to the gross profit column besides establishing a selling price and considering what you patch on your bill.

"Your expenses and what they apply against are also a snare and delusion to the man who has not an accurate accounting system. Expenses to-day with the modern druggist are what I could liken to an instance fifteen years ago where a retail druggist in this city, who had a very large business and who was operating in connection with it a manufacturing plant and making his own goods. When asked by me what his goods cost him, how he arrived at his selling price said, that he takes every bill that comes in and figures the cost of an individual package, plus the cost of the bottle and the cork, etc., thus arriving at the selling price. I said, what do you do with your overhead expense? He replied that he didn't have any, that he charged all labor that is directly confined to the manufacturing against the cost; that he used his clerks to help out, to bring down stock and sometimes, if he had a wholesale order, he used the clerks in the retail stores, etc., etc.

"Many merchants are doing the same thing to-day—carrying a burden of expense that they are not charging to any department of their business.

"The other day a manufacturer of automobile bodies sent me a bill for \$28.00 for making a little leather cushion for my chauffeur's back. I asked him why he charged \$28.00 for it when I could buy the same thing for five or six dollars in any department store. (The manufacturer figured up the material and labor cost which came to about \$10.00, and the balance he explained was for overhead.) That fellow isn't very far off at all. He is doing an individual business and has a large overhead. He must have a lot of waste time in his plant. He undoubtedly is careless about his lights, etc. He apparently has had at sometime one of those 'efficiency men' checking up expenses of doing business.

"I brought this out to illustrate the fact that there are too many retailers and manufacturers in business who are going along figuring their expenses upon what they see set down. The true expense is the total of all items necessary in conducting a retail drug store—labor, rent, light, heat, clerk service, janitor service, window trim, the purchase of signs, or the newspaper advertising done, paper, twine, glassware at soda fountain, and so on, through the numerous things which total the expense. There is not one druggist in a hundred in this country who gets a total together yearly and looks it squarely in the face to see just what his position is, and he ought to do it monthly.

THE INVENTORY.

"I am president of a Fire Insurance Company and it is almost a daily, and I know it is a weekly occurrence, to have a fire in a customer's store, where we find that no inventory had been taken since the man started in business, or else he did inventory on the 31st of last December to the 10th of January, all the time doing business, which means that they didn't get an exact inventory. This is an almost daily occurrence. It is a different thing, as I have found from experience, to have your own store managers and clerks take inventory and have it right. We never got a correct inventory until we established inventory crews and actually shut down business while the inventory is being taken and then adjust the inventory to the amount of merchandise sent into that particular department. Until we did this we did not get at the 5 percent.

"Now these are just a few of the rudiments that have brought about modern merchandising. With these have come the development of the chain stores. The one-price system started by Wanamaker brought the one-price system to the Atlantic and Pacific Tea Company, with its tremendous developments. It extended to the 5 and 10 cent stores and from that it went to the cigar stores, then it went to the numerous grocery stores and now into the drug stores. These, of course, are the larger chains.

"The chain store system has been said to be a fallacy. A student of merchandising told me that the chain stores were doomed to fail; that they could not possibly succeed because they would break of their own weight. Now my personal experience is quite the contrary. The more weight you have, the more you have to work with. The stronger the organization, the more men you have to gather around you from whom you can select those who are to carry out your plans. Their development is only limited by the ability to secure the men to see the proposition through.

"Therein again modern merchandising is doing a world of good. It isn't always the man who is the most ethical or has the most complete knowledge of the drug store that makes the best success in operating a retail drug store. It is the man who is most capable of handling and getting from those working with him all the good in them. I do not mean all the hours of work, but all the ability. One who can shift his help around until he has a smooth working organization.

(Mr. Liggett then told of a visit to a western city to see why a certain store was falling down. Upon entering the store he found that the manager was out, and the assistant, when he found who his visitor was, greeted him in a loose, careless fashion, which explained the loss of business, namely, lack of back-bone in the store.)

"So you see that modern merchandising has got to take into consideration the human element.

PERSONALITY IN BUSINESS.

In answer to a question as to whether personality played an important part in competition, Mt. Liggett said:

"It is contended that the chain stores are such severe competition that the retailers are driven out of business. Four and two-tenths percent of the failures have been found to be due to competitive methods and 34 percent due to lack of business management on the part of the retailer. In the largest development of chain stores personality is worth a great deal in the drug business. It goes back to the question of service, the question of training the retailer gives his clerks, his standing in the community, etc., and attention to his trade. It doesn't always imply, as some people think, that they cannot be too friendly with their customers because they will ask to be trusted, but simply means a fixed principle of doing business, and that establishes personality as much or more than any one thing. There is no doubt about the fact that where personality dominates in a community that the chain store has the hardest kind of competition to overcome."

OVERHEAD EXPENSES.

Regarding overhead charges and the percentage cost of doing business, he said:

"These varied with the condition of the business. We have stores in New England that make 31-32 percent gross profit. We have stores in New York City that will make 37 percent gross profit. We also have stores in Toronto, Ontario, that make 22-23 percent gross profit. Expense accounts run in the neighborhood of 20 to 30 percent. In New England States, where gross profit is low, we have a very large volume of cigar business which is handled on a very low margin of profit. Drug stores have had control and still have control of the retail cigar business in New England. Larger cigar stores do not exist in New England like in New York. We average in cigar business somewhere in the neighborhood of 9 percent, but sometimes it runs 20 and 25 percent of the volume and with so large a volume on a small profit it pulls down the total gross profit. Why is it higher in New York? Because we have less cigar business, and more soda business, which has a larger profit. In the final net profit of a store it does not matter if we have a low margin in New England or a high margin in New York because where we have a high gross profit it costs us 16 percent to clerk a soda fountain and it cost us 4 percent to 5 percent to clerk a cigar counter in New England. Therefore you can see where you find a larger margin of gross profit you invariably find an increase in expense. If you take an average in the entire United States you will find the gross profit of the retail druggists in the neighborhood of 35 percent, and let me say right here, it is going down, down, right along. A recent analysis of the Pharmaceutical Department of the United Drug Company proves this. We found, after investigation, that a druggist in Atlanta was getting 60 cents for a 4-oz. prescription as an average price. After going over a period of five years we found that he now filled the same prescription at an average of 50 cents. Notwithstanding the fact that the cost of the ingredients has advanced, they are getting less for the prescription.

"The expenses of the retail druggists in this country will show between 26 and 27 percent of their sales and this does not include the question of investment and interest charges which we take into consideration in the chain stores. It does not include depreciation. One percent per month of the investment should be charged to depreciation and unless this is done the merchant is fooling himself. The retail merchant should speed up turnovers as fast as volume goes up. One of our drug stores turns its investment fifty-two times a year. Everyone should have a schedule of turn-overs for each department in the store.

"In the question of buying, more men go broke when over-buying than those who under-buy. It does not pay any man to buy any more than is necessary to operate his store. Four times a year is the least number of turn-overs you should consider.

"It pays you to take care of windows well and never put in a window display without the price on every article of merchandise."

Mr. Liggett explained that the chain stores did a great deal in bringing back the sundry and toilet goods business to the drug store, which had been gradually slipping away from them.

Mr. Liggett said, "that the one-cent-sale idea was started in 1914 during a period of business depression, and was the result of efforts to hold volume; that there is nothing in the world that will add to the inventory like a one-cent-sale and at the same time it is one of the biggest business boosters he had ever come in contact with, and productive of good returns if run occasionally."

MODERN DRUG STORE ADVERTISING.

BY H. P. HYNSON.

The following address was delivered before North Carolina Pharmaceutical Association several years ago. It is just as applicable to-day as then and presents the subject of Modern Drug Store Advertising from a pharmacist's viewpoint and valuation. While it has been the intention to print the address before now, the opportunity did not present itself as it does for this issue of the JOURNAL, wherein an article on a related subject appears.—EDITOR.

"The shortest comprehensive definition of the word 'advertise' is: 'To divert or direct the attention.' The calling and holding of favorable attention is good advertising. The calling and holding of unfavorable attention is bad advertising; many of us are doing both unconsciously.

"Let me assure you that the very best advertising, especially in the retail drug business, is done without a trace of color or a drop of printer's ink. I believe that great harm may be done and much money wasted by the injudicious use of illustration and printing. Practicing cleanliness, order, system, true aesthetics, consideration, truth and honesty is the kind of advertising in the drug business that brings best results at the smallest cost. I could better tell you what I mean, I believe, by quoting freely from a recent address on this subject by Mr. J. Thomas Lyons, Advertising Manager of the *Baltimore News*, one of the leading dailies of this country. I was greatly encouraged to find that Mr. Lyons set forth my exact views upon this subject, as can be shown by the agreement of

his expressions with my own policies and practices during my business career, including now some thirty-four years. I read from Mr. Lyons' address as follows:

"Advertising does not necessarily mean bill boards, street cars, newspapers, blank walls, circulars, programs, letters, or any one specific thing, but advertising means anything that attracts the attention of one person or of a million people to your business or to you personally as the proprietor of that business, and if the retail druggist could only realize that almost every waking hour he is advertising or mis-advertising his business, he would pay some attention to the importance of correct advertising.

"If an efficient man were to be called by a neighborhood druggist and told to do what he could to increase the profits of the business, the first step, no doubt, would be to see if three or four dollars in white paint would not be a good advertisement in the druggist's window. If there was anything about the exterior of the building that might create the impression in the mind of the passer-by that carelessness and slipshod methods prevailed within, that condition would have to be corrected.

"The interior of your store often has an unconscious influence, either favorable or unfavorable, on the prospective customer, and you can not get correct store atmosphere unless the things therein are right."

"Advertising begins with the personnel of any business enterprise, beginning with the proprietor and his assistants, then all down the line to the porter and errand boy. In a recent address on the teaching of commercial pharmacy, I tried to set forth what a commercialist should present in his person and I had in mind such a person as would at once and most effectively advertise the enterprise with which he might be connected. One so equipped could render attractive service and service is what is desired by the world to-day, as I have styled it in a late advertisement of my own: Satisfying supply service—service you need, to secure Antitoxins, Vaccines, Serums, Bacterines, Oxygen, Normal Salt Solution, Infusion Apparatus, Camphorated Oil Ampules and other emergency requirements.

"I will take the liberty of reading some extracts which will describe the personal qualification of the pharmacist that makes the very best advertising matter, taken from the address to which I have just referred:

"The personality of the pharmacist, or of one who purposes to become a pharmacist, is of much importance. While pharmacy is a vocation requiring no great physical strength or power, it does require a considerable amount of endurance and, because the hours of attendance upon duty are comparatively long and because most of the time devoted to business is, necessarily, spent indoors, it is not the proper engagement for those predisposed to tubercular trouble or those with anemic tendencies. It is a business suited neither to a deformed nor to a crippled person; quick, well-ordered movements are required and extraordinary control and use of the hands and fingers are necessary.

"As successful salesmanship is an important qualification of the pharmacist and since the personality of the salesman has much to do with his success, appearance, or address, as it is more politely called, must be seriously thought about, much thought about. One can not, of course, change his features, neither can he materially alter his size, but there are some defects which may be overcome, by thoughtful and determined effort; rounded shoulders may be corrected by similar effort, assisted by braces; an awkward, ungainly gait or slovenly carriage may be easily changed."

"Much of the same character might be said regarding personal cleanliness, dressing, manner and style of speech, and the proper training of the mind for commercial purposes. If a proprietor appreciates the value of personal attractiveness and possesses this strong advertising power, he will, naturally, seek such at-

tractions in his assistants. Much good money spent in advertising goes to waste, because of the fact that customers brought to the store are not pleased and held as customers because of the character of clerk that waits upon them. It may be thought by some of you that this is foreign to the subject under consideration, but I believe that many pharmacists fail to win success largely because they are not careful enough regarding the appearance, intellectuality and dispositions of their employees. Again, I repeat that attractive, pleasing personalities rendering efficient, satisfying service, are the most profitable advertisements a drug store can use. Service is the key-note of good business to-day. Service is the real inspiration of Rotary, that remarkable and fast-growing organization now numbering more than twenty-five thousand alert commercialists, who unite in believing that golden rule practice is the best advertising and that following the motto, 'He profits most who serves best,' will sell the goods.

"It is an old story that I bring you regarding directly-unpaid-for service as an advertising feature, but I would fail in my duty toward my audience if I did not emphasize the help it has been to me in establishing and maintaining a fairly profitable business. This directly-unpaid-for service must be rendered with as much grace and good feeling as that which wins the highest remuneration, otherwise it will be the veriest boomerang. If you sell stamps, keep all that will be called for and of every variety on hand and sell them with eagerness. It will pay you, even if you have to borrow the money, to use one or two hundred dollars, or as much as is required, for the purpose of keeping change for the accommodation of all who seek the favor. No expense should be spared in supplying directories and all such other appliances as will be helpful to those who may become or are your customers. Beginning with an ordinary pair of scales on which people could weight themselves, we have developed this feature until we now have a pair of scales which cost us \$210.00 and we believe this is the best advertising investment we have ever made. Not only do people come in and appreciate the character of these scales, but physicians from many parts of the town send their patients to our store to be weighed. There are, in different neighborhoods, many other services that may be rendered. The suggestion of Mr. Lyons that a rolling chair be kept to be loaned, for short periods, to invalids in the neighborhood, and especially to be used in the removal of patients, is an unusually good opportunity to make an impression both upon physicians and the laity.

"No matter how attractive and efficient the personality of an establishment may be, it cannot, however, render the service that will make particularly fine advertising, unless it has the proper place in which to give such service. It must also have ample equipment.

"Often before a possible customer can ascertain what service you have to offer or see those who are to supply it, the possible customer is advertised away from both by the uninviting exterior or surroundings of the store. How is a stranger to know that you are the most capable and intelligent pharmacist in town or that you have the best and largest stock and employ the most attractive and agreeable assistants, if the building, the show windows and the signs, all positively tell him that such is not the case? How is he to know that you conduct your business in a serious and dignified manner when your windows and signs tell him that you are catering only to the frivolous, the gay and the ignorant? Does

he read that yours is a high class pharmacy carrying dignified side lines and, incidentally, supplying 'thirst quenchers?' Look at your signs, my good friends, and see what you are most prominently advertising, generally in impressive green or glaring red. Thousands and thousands of pharmacists in this country have sold their most valuable birthright in advertising for a very poor mess of pottage.

"Infrequent circulars, small spaces in the newspapers, counting these as good advertising, are as nothing compared with the very extensive space you are giving on the exterior walls of your building, in your show windows, on the interior walls of your store, in your fixtures, by the disarranged aspect of your stock, by the unkept, uncleanly condition of your store, to very, very bad advertising.

"Ruskin has given the world the seven great lamps of architecture, and architecture is most serviceable, and most enduring, when these seven lamps are allowed to brightly burn. As leading to the proper construction, arrangement and appearance of a drug store, I would use four of Ruskin's lamps, the lamp of 'Truth,' the lamp of 'Beauty,' the lamp of 'Power' (scope), and the lamp of 'Life' (energy). To these, I would add a lamp of Appropriateness, a lamp of Consistency and a lamp of Modesty. With these seven lamps leading me, I would have a store, in truth, just what it pretends to be; it would be truly beautiful, it would be large enough in which to do business acceptably, it would be a lively, fresh-looking place, and it would be well suited for such a business; it would be consistent in all parts; the prescription department and equipment would be quite as complete and as attractive as the soda fountain and its ceiling would not be more ornate than its floor covering. With all, it would be modest and not over-pretentious for the neighborhood in which it was located or for the customers who would patronize it. It would not make me, my clerks, and my little stock look like thirty cents. A store so conforming to the lamps mentioned would, of itself, be worth all it cost as an advertisement; I mean, it would do more and better advertising than could be possibly done by the expenditure, annually, of six percent of its cost, a fair interest on the investment, if such an amount were spent, even judiciously, in printer's ink.

"Too much attention cannot be called to the advertising worth, the pulling power of the appearance of things. This applies to building, to front, to windows, to fixtures, to appointments, to arrangement of stock, to business stationery, labels, and especially to containers, regarding their appropriateness and quality, and to packages and their wrapping. All these can be made most useful in establishing, enlarging and holding business.

"Color and color harmony give so many of us great restlessness, if our state of mind is as much disturbed as is our adjustment of colors. The selection of colors, wherever colors may be used, is a momentous question and, when you are in the least doubt regarding appropriateness of colors, or the blending of these, no matter for what purpose they may be intended, you are solemnly advised to 'play trumps,' that is, use none at all and resort to black and white.

"Considering the good or bad advertising effects, one should never be too sure that his taste, as to the appearance of things, is just what it should be. I have seen labels used by druggists who thought they were particularly attractive, which did violence to every principle of appropriateness and good taste.

"Considering all the advertising I have ever done for our retail business, and I have spent much time, thought and money in this direction, I believe the most profitable and helpful of all has been the attention given to the appearances of packages going out of our stores. No expense or effort has been spared to make them just as attractive and as pleasing as possible. It is a fact that many of the best and most profitable customers of drug stores, after years of patronage, have never seen either the proprietor or the store. These must be favorably influenced by the appearance of the packages and the service that is supplied.

"All advertising, whether the kind I have been describing, or the more generally recognized kind, is of no possible avail, if you do not have in stock the right kind of goods in sufficient quantities, properly marked, and conveniently and attractively arranged. If you ask me what next to the appearance of our packages I think has been the most profitable advertising, I would answer, without hesitation, the use of standardized galenicals. I began using these as soon as they were put on the market, about 1885, and have been using them ever since, and we have never, to my knowledge, had a single complaint about the activity of our alkaloidal preparations, but much more to our gratification, we have had many, many favorable commendations upon the uniform action of these products. And so, with every other class of goods, it is the standard or standardized product that will give most satisfaction to your customer and to yourself. The extra price paid for these goods might very justly be charged to the advertising account. 'The best,' is what the physician and the people want from a drug store. Let them get cheap and unreliable stuff elsewhere. The druggist should not fail to take advantage of the opportunity to advertise himself and in the very best and most lasting manner, by supplying goods that cannot be criticised, no matter what he may be compelled to pay for them.

"Possessing the personality I have indicated, with a store, equipment and stock such as I have described, imbued with the desire to render fair, honest service, do you think you would have any trouble in telling those who might be led to deal with you the advantages of giving you their patronage? Advertising as generally understood, in my opinion, consists of frank, open statements, consists in telling the truth regarding yourself, the service you have to render and the goods you have to sell. In every instance, I believe there should be the stamp of individuality upon the advertisement; it should be characteristic of the man and of his particular business. It is worse than useless to use other people's methods or another's combination of words, because they do not fit your case. Some one who knows, really knows, what is to be advertised, should frame the advertisement. It may be that the text, the wording, should be supervised, yet I believe that a man is not sufficiently well prepared to enter the drug business, in this age, if he is not able, himself, to write profitable advertisements. Should it happen that he does not consider himself personally able to attend to this part of the business, I feel safe in advising him to give to it enough time, study and money to become sufficiently accomplished in this line, to meet his own requirements.

"I would especially warn against the use of those familiar drug store cards, which invariably begin with 'Pure Drugs and Chemicals,' and, as invariably, contain the assurance that 'Prescriptions are accurately compounded.' As a slight

variation, it may read: 'Prescriptions compounded with accuracy and dispatch,' when we all know they should be prepared with mortars and pestles, spatulas and elbow grease. Advertisements, to be helpful, must have some specific purpose and should, if possible, make an impression regarding a specific fact in connection with the business advertised. It is a good principle to begin with a general phrase or heading that will interest almost everyone and then gradually draw the attention to yourself and your business or to some one thing that you wish to present. The funnel illustrates what I mean, you begin with a large opening and gradually draw the attention of the possible customer down to the apex or neck of the funnel and then through it into your store with a definite object in view. For example: 'Some day—Yes! Some day, you may be ill and need a druggist.' 'Decide now, where you will go when you have a prescription to be filled.'

"As Mr. Lyons has aptly stated, 'The average neighborhood druggist can not advertise in newspapers profitably because he pays for the total circulation of the paper, and can hardly cash in on more than 5 percent of the circulation.' He also says: 'Many druggists have tried to build up a telephone business, but this has often proved disastrous, because the cost of delivery takes the profit from the sale.' If the drug store is not centrally located, it is unprofitable for it to go after business outside of its own neighborhood, because of the extra cost of delivery. If newspaper advertisements are used, preferred space ought to be selected. It is much more profitable to use a small amount of expensive space than it is to buy a section in a position that will attract no attention. Advertisements, in daily papers, should, in my opinion, be changed each day, and I think in weekly county papers they should be changed with each issue of the paper. Not much should be said; only pointed facts should be brought out.

"The practice of sending out cheap circulars has a tendency to cheapen the store in the estimation of those seeing them lying around. It is much better to get up a small number of expensive circulars and see that they are directly delivered to the possible customer. I am clearly of the opinion that, no matter what the location of the drug store or the character of the customers may be, there must be a certain amount of dignity and tone about its advertisements. All that I have said about appropriateness and colors should be applied to the advertising matter issued by pharmacists. Especially should the construction be grammatically correct and refinement in expression should be, consistently, a characteristic. Catchy phrases are desirable, of course, but these should not be used at the expense of good English or of reasonable dignity. It is a very serious question whether profuse advertising of the drug business to the laity pays or does not pay. I believe that the advertising of some side-line at a time, or the advertising of a special feature, by proper circulars, could be made to pay.

"I have no doubt but that the plan I have used of advertising continually and persistently to physicians is the very best method of building up a real drug business. It is a character of advertising that requires very great care and the possibility of overdoing it or misdoing it should always be kept in mind. There are many things that can be sent physicians which will remind them of the sender; these should, however, frankly appear as advertisements; they should not imply an obligation, but they should be of a character which will insure their use and

preservation. Cheap prescription blanks, unattractive blotters or useless publications are really harmful. One must know the needs of a physician and must try to supply these needs in a manner that will be acceptable to the receiver."

In concluding and summarizing, the speaker said:

"I believe to advertise successfully, one must have something to tell, must have something good to tell, and must really believe he has something to tell that will benefit those he desires to serve. If then, he will tell his story earnestly, enthusiastically, and, above all things, truthfully, he will be able to do advertising that will bring profit to himself and give satisfaction to those upon whom it has had effect."

THE NEED OF QUALIFIED PHARMACEUTICAL SERVICE FOR THE AMERICAN SOLDIERS IN THE UNITED STATES ARMY.*

BY FRANK CAIN, M.D.

As the great war continues we grow increasingly conscious of the enormous task before us in providing for the immediate health and safety of the American soldier, which is equivalent to the ultimate salvation of all of us. For the army and the navy are the bulwarks that stand between us and the horrors of servitude. Democracy must trust everything to her sturdy sons hastening to the field of battle. But if this is so we must do all that lies in our power to keep them sturdy and capable of defending us. Already in a thousand directions keen minds are at work with this end in view and constructive legislation is creating the conditions for its realization.

The movement in favor of Pharmaceutical Army Corps is one phase in this general tendency toward constructive national legislation and achievement. To the expert or careful student of such matters, the value and meaning of qualified pharmaceutical service in winning the war is obvious. To the general public, consisting of laymen, even to the educated laymen, this value is not so clear. There are even members of Congress who oppose the Edmonds bill (which authorizes the creation of such corps) on the plea that they are unnecessary; that medicine in handy tablet form can be dealt out by any one. But their standpoint is still that of the laymen and consists largely of mental snapshots taken at the corner drug store or the village apothecary's.

Their knowledge of the pharmacist and his work is frequently merely impressionistic, and uncritical or rather superficially critical, and it may even be drawn from an acquaintance with the pharmacist's employees; the boy at the soda fountain, for instance. It is always unsafe, however, and likewise unjust to judge the finished product by the raw material alone—to estimate the trained pharmacist by the potential druggist. The public is also liable to misinterpret the motive of the pharmacist, in seeking recognition in the Army, believing this to be selfish personal interest, an error which we trust we may be able to dispel.

* Read by the author at the Lloyd Library, Cincinnati, Ohio, June 18, 1918, before official representatives of the Cincinnati Branch of the American Pharmaceutical Association, Ohio State Medical Association, Ohio Branch of the National Pharmaceutical Service Association, Ohio Valley Druggists' Association, Ohio State Pharmaceutical Association, representative citizens and the Drug Clerks' Association.

All this being admitted, we must therefore conduct an educational campaign, nation-wide in its extent in order to convince the public that Pharmaceutical Army Corps are necessary. And we are certain that once the public is shown the facts, it will demand what it has hitherto viewed with indifference or even been unaware of. For the American public, as a thousand testimonials from press, pulpit and every source of popular expression prove, is absolutely sure that there is nothing too good for the boys in khaki "over there," whether it be books to read, food to eat, or medical care for the sick and wounded.

The public then wishes to know why Pharmaceutical Army Corps are desirable. Taking up the question first from the standpoint of abstract justice to the individual pharmacist, we find that he has spent many years in preparing for his profession. Such a man will be efficient, only if placed at his own work. The spirit of efficiency which is coming to guide us in all our activities, dictates that each man be in his proper place, and the general rule covers the particular instance. It should apply to the pharmacist as to the engineer, physician and all others. Again, the pharmacist or student of pharmacy has in addition to his years of apprenticeship spent other years in institutions bestowing a scientific training in his profession. He is, or ought to be, somewhat of an expert in many branches of science. He must be a chemist, physicist, botanist, and an expert in crude and refined drugs, as well as poisons. Is all this training and ability to be thrown away? Would it not be better employed in actively serving the Government?

The ideal of Democracy, in opposition to Autocracy, with its crushing of the individual, is personality in the members that compose it—the ideal of the fullest realization of the powers and capacities of the individual in their appropriate objects. And in his ideal is the promise not only of justice to the individual but of the maximum of social efficiency.

Social efficiency—this after all is the keynote of our desire for the recognition of pharmacy, and the institution of pharmaceutical army corps. Social efficiency to-day means national efficiency, the first prerequisite to the success of the United States in this war, and the safety of the world which hangs in the balance. We could waive all questions of individual justice for pharmacists. The pharmacist has but one desire and that is to serve America. He is willing to serve in any capacity if need be. Letters from pharmacists now serving in the ranks of the United States Army are eloquent testimonies to this fact. All unite in their spirit of eagerness to serve the country with mop and broom, it may be, or with rifle and bayonet at the fighting lines, to the end that Kaisercism may be defeated forever. Nevertheless, they express regret at not being able to contribute their particular skill and training in the interests of their comrades' welfare. What wonder if amid so many expressions of pure altruism, a note of personal chagrin creeps in at times, because in the majority of cases the pharmacist is assigned to some duty which has no relation whatever to his profession. While at the same time the dispensary at the very Post at which he is stationed, may be under the supervision of one who is not a pharmacist.

Thus the pharmacist in the Army feels that it is good to serve Uncle Sam in any case, but that it would be much better to be able to serve efficiently. This means in the first place to serve in his chosen line where he knows that he can "deliver the goods" and that no one else can satisfactorily fill his place and, in

the second place, it means actual service as a pharmacist at the front with the fighting men. This would also be justice to all, for after all, Plato's conception of justice as each class performing its special task, each man minding his own business, in a word, performance by those best adapted to perform is as true to-day as it ever was.

Thus from the point of view both of individual and social justice, the pharmacist deserves recognition as a distinct and valuable unit in our fighting forces. We have dwelt briefly on the greater efficiency thus attainable, but it may be well to develop the point.

Success in war is no longer only a matter of courage in the soldiery or strategy and skill on the part of the commanders, or the possession of deadly instruments of warfare, or of all these things combined. Wars are no longer mere contests between the public armed forces of belligerent peoples, while the masses of people on either side look on, more or less passively, or are indifferent, like the philosopher Hegel writing his learned treatises while the guns at the battle of Jena thundered in the distance. To-day entire nations are mobilized against one another. All of the material and spiritual resources of a country must be pooled and organized to successfully resist the foe. It is a contest of efficiency and of morale which is in part at least the result of the consciousness of efficiency.

Now efficiency depends upon division of labor. Historically, increasing division of labor has accompanied progress in civilization and civilization is a function of efficiency in living. The primitive horde in which every man was a "Jack of all Trades" and provided for all his own wants, gave way to the tribe where the arrow-maker, the chipper of flints, the man-lecturer of nets, and the medicine man began to specialize on certain phases of the general activity, and so foreshadow a future period of universal mutual dependency, and reciprocal service. All through the classic and medieval periods, division of labor increased and reached its maximum in our modern industrial age of machinery. To-day there are innumerable vocations and professions, each boasting its experts and within each is a sub-division or redivision of labor, so that in such a profession as medicine, for example, there is a multitude of specialists of every kind. This minute division of labor is what makes modern medicine so efficient in contrast with that of the past. Each specialist is enabled to assimilate and apply all there is to be learned in his particular branch.

What is true of the modern world, under the normal conditions of peace, is no less true under the abnormal conditions of war. In fact it is even more essential that each kind of service required should be performed in the speediest and best way—in short, by the man equipped for the specific task—the expert.

If one of these experts, say the physician or surgeon, be compelled to devote his attention to a variety of tasks instead of that for which he is peculiarly fitted, he is handicapped at the start. His best efforts are thwarted because he must scatter his shot. Yet this is just what happens if the physician or surgeon is forced to supervise, or attend to the pharmacist's work in addition to his own, as is the case at present in the United States Army.

Disease has been the deciding factor in many of the great campaigns in history, whether those of a Pharaoh in Egypt, a Hannibal or a Napoleon. It will be recalled that the army of the Assyrian when he "came down like a wolf on the

fold" was stricken by the "Angel of God" and decimated; in short, his army was so afflicted by disease that he was obliged to raise the siege for want of fighting men and succeeding centuries have witnessed similar disasters.

In modern times cases are recorded where regiments were exterminated before they could reach the seat of war, notably in the Crimean war, when in a single six months' campaign, of 50,000 men lost, but 2,000 died of bullets. Again, in the Madagascar campaign of the French in 1894, 7000 out of 14,000 men engaged, died of disease while but 29 men were killed in battle. In the American Civil War a little less than the proportion of 4 to 1 died from disease as against those slain on the battlefield. In the Spanish-American War the proportion was about 11 to 1, for the entire war, and 14 to 1 during the first 100 days. In the Franco-Prussian war, one man died from disease for every two slain in action, while in the Russo-Japanese war the oriental armies lost but one man from disease to every four killed on the firing line, the best record yet made and one attracting universal attention, which is proof of the great value of a scientifically organized medical department, which includes Pharmaceutical Corps.

To-day Germany claims that 87 percent of her wounded are returned to service, a fact which partly explains why Germany still has a huge army despite tremendous losses. The Germans have been fortunate enough to retain their own wounded as a rule, and these were generally restored to active service. The Allies must achieve the same results, in the treatment of sick and wounded, or our potential numerical superiority will not avail us in the struggle. Fortunately, however, our own record compares very favorably with that of the enemy. Surgeon General Gorgas recently announced that 80 percent of the American wounded will be restored and returned to service again, while only 10 percent will be permanently disabled. This shows that remarkable work has already been accomplished. But the fact that the whole burden of this great work is thrown upon the physicians and surgeons, results in a constantly increasing call for more doctors in the Army. A noted surgeon, Dr. McLain, speaking recently before the American Surgical Association, in Cincinnati, was quoted as saying that "every available doctor in the country might be called to military service before the present conflict ends." But it is clear that our success in the war would not be furthered by sending every physician abroad. Who would then care for the health of the workers at home? "We ought to have enough physicians to care for the Army's sick and wounded and for the really vital needs of the army and civilians at home at the same time.

It is plain that the doctors of the Army need and would welcome assistance, and what more welcome assistance could be afforded than that of an organized corps of competent pharmacists who, by relieving the doctor of numerous labors of preparation, analysis and supervision, would restore the normal division of labor to which he is accustomed and permit his concentrated attention to his specific task?

This arrangement, moreover, would have the further advantage of preserving and augmenting the pharmacist's professional skill, so that he would be a more efficient member of society upon his return to civil life after the war. The conservation of professional skill is a part of the general conservation of the country's resources. At present the reverse is true. The pharmacist who goes

to the trenches may have no opportunity for several years to practice pharmacy, or keep up with its progress. As a consequence, he is likely to come out of the war "a back number." The creation of new skill is always more difficult than the maintenance of what we already possess.

The arguments thus far advanced seem to us amply sufficient to convince any one that the pharmacist has a definite and necessary place in the U. S. Army. For the sake of completeness, however, we touch upon a few other points generally referred to but which bear repetition. In the first place, it cannot be too much emphasized, that laws in every state of the Union require legally accredited pharmacists to dispense drugs. Laymen are not permitted to do so lest the citizen of the commonwealth suffer thereby.

Shall those on whom the hope of the world depends—the soldiers of the United States Army have inferior service in this regard? There can be but one reply. Not inferior, but even superior, service if possible. The men and women at home would demand it if they conceived the problem clearly. The soldiers themselves have no time to ask it or even think about it. Their one thought is to give efficient service as soldiers. The motive of patriotism effaces self. But we who are at home can clearly see their needs, and it is our social, our patriotic, our Christian duty to provide for them.

In the second place, the dispensing of the numerous poisons specified in the official drug table of the U. S. Army—there are some 200 deadly poisons among them—must be in skilled hands. In a war with an unscrupulous enemy resorting to poison gases, and the poisoning of water supplies and food where possible, adequate knowledge of the treatment of poison by antidote and antagonists should be possessed by those dispensing drugs as well as army physicians.

Finally, the example of our European Allies, as well as that of our enemies, should impel us to the establishment of pharmaceutical army corps. Germany has a splendid organization of the kind, with military pharmacists of a number of orders of rank. We must fight fire with fire, like the pioneers of the western prairies, and match Germany at her own game, here as elsewhere. England and the United States who lag behind in this respect, must establish such corps to coöperate properly with their great French ally who considers their Pharmaceutical Corps indispensable.

If the reader finds himself wearied by what he may call truisms, or by re-statements of things he already knows or fancies he knows, let him remember that all good things bear repetition. It is only by repetition that we learn that most essential of all essentials in education, the letters of the alphabet. And the alphabet of the nation's needs, in which pharmaceutical army corps is one of the letters, like any other alphabet, must be thoroughly learned before we can spell out a speedy victory.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 19.

PHILADELPHIA, July 17, 1918.

To the Members of the Council:

Motions No. 27 (Investment in Liberty Bonds for A. Ph. A. Research Fund) and No. 28 (Election of Members; applications No. 205 to 247, inclusive) have each received a majority of affirmative votes.

Motion No. 29. (Election of Members). You are requested to vote on the following applications for membership:

 All of the above petitioners (except Louis Frank) are not members of the Association, although they have applied for membership (Motion No. 30). Do you favor granting the above petition contingent upon the election of the non-member applicants to membership in the Association? This will be known as *Motion No. 31 (Granting of Petition to Establish Wilkes-Barre Branch, A. Ph. A.)*.
 J. W. ENGLAND, Secretary.

COMMITTEE REPORTS

REPORT OF THE COMMITTEE ON DRUG MARKET.*

The most impressive fact noted while studying the large amount of material presented by the various members of your Committee on Drug Market, is the excellent condition of drugs and chemicals in general. The committee is very fortunate in having access to the analytical files of laboratories that examine a wide variety of goods, so that on account of this privilege, it is able to give a comprehensive report of the conditions prevailing in the drug and chemical world. It is very gratifying to note the maintenance of the high standard of quality noticed in recent years and that goods of standard quality have been consistently offered for some years. Various articles from time to time fall off in quality but after a period of back-sliding they generally return to a normal condition.

The cases of wilful adulteration were few and as in recent years the most trouble has been caused by the ignorant and by those who use careless methods of manufacture. However, it is usually not difficult to obtain goods of standard quality but constant watchfulness is essential to guard against imposition by the unscrupulous and careless, who endeavor to dispose of adulterated or inferior goods. Those who follow analytical work appreciate the excellency of the U. S. P. standards and tests, as they are fair and render uniformity of results more probable thereby avoiding considerable contention regarding methods. These tests and standards reinforced by the rulings of Federal and State governments and the efforts of conscientious manufacturers and retail dealers are responsible for the present high standards of excellence. It is found also that the quality of chemicals formerly produced abroad, but now manufactured in this country, is excellent and it is gratifying to note the success of American chemists in their accomplishment of wresting from Germany the control of many lines of chemical industry

* Presented at 1918 meeting Pennsylvania Pharmaceutical Association.

As in former years, we found a number of substances which were only slightly inferior and were considered of acceptable quality, although not strictly equal to the standards. They often were low in strength but usually contained traces of harmless impurities. The number of rejected or decidedly inferior shipments and broker's samples was not excessive considering the fact that several thousand samples were examined by the workers of the various laboratories contributing to our report. There were about 90 in all, divided as follows: Chemicals, 42; drugs, 38; oils and fats, 8. Most of the drugs contained excess of stems, stones and earthy matter but usually the foreign matter could be removed and the shipment put in an acceptable condition.

As reported in the following pages, there were 8 substances subjected to adulterations, substitution or gross carelessness, for instance: Cottonseed oil was substituted for olive oil and tap water for lime water. A lot of belladonna root was adulterated with scopolia, and sugar with table salt. A shipment of citron essence was found to be oil of lemon, and a shipment of lithium benzoate was found to be barium hydrate. Several lots of storax were of very poor quality and had probably been deprived of their cinnamic acid and esters. One lot of rennin was only half strength and a lot of wild belladonna contained only a trace of alkaloids. Two shipments of diastase were only one-half strength and contained 50 percent of water-insoluble matter. Another shipment was three-fourths strength and contained 30 percent of water-insoluble matter.

The detection of these cases of gross inferiority, adulteration, and substitution emphasizes the necessity of close analytical control and examination, as it protects health, avoids waste of effort and material, insures uniformity of results and increases efficiency. This is particularly true at this time of war when all waste of any kind must be avoided in order to aid our country and its allies in their fight to maintain liberty at home and render it possible for oppressed peoples of other lands to obtain it in full measure.

The substances commented upon in the following pages have all been examined by practical and experienced workers during the period from June 1, 1917 to June 1, 1918 and have been taken from the files of the laboratories of H. K. Mulford & Co., Prof. Charles H. LaWall and Smith, Kline and French Co., who generously offer them for the benefit of the Pennsylvania Pharmaceutical Association in particular, and the whole pharmaceutical profession in general.

ACETIC ETHER: The only lot examined yielded a trifle more residue than is permitted by the U. S. P.

Reported by J. G. ROBERTS.

ACID, ACETIC: An instance of lack of uniformity in shipments was found in the case of a three-barrel lot of 80% acetic acid. The contents of one barrel was decidedly reddish, another had a slight yellow color, while the remaining one had a normal water-white appearance.

Reported by J. G. ROBERTS.

ACID, BENZOIC: A slight excess of chlorine was discovered in each of two lots which were otherwise of normal quality.

Reported by J. G. ROBERTS.

ACID, ACETYL SALICYLIC: One lot was rejected because of excessive free salicylic acid and perfumed odor.

Reported by G. EWE.

ACID, HYDROCHLORIC C. P.: One lot contained an excess of iron and free chlorine.

Reported by G. EWE.

ACID, SALICYLIC: During the past year this substance has not been quite as good as usual. Of the four lots examined only one was entirely satisfactory. One of the other three had an undesirable yellow color, a trace of phenol and was 0.44% low in strength; another was 0.55% low in strength and the remaining one was satisfactory except that it contained a trace of phenol.

ADEPS LANAÆ: Occasional lots have offensive odor.

Reported by G. EWE.

ADEPS LANAÆ (HYDROUS): One lot complied with the requirements of the U. S. P. and one lot was of very poor quality. It contained chlorides and excessive amounts of water, free acid and ash. It had a dark color, an alkaline ash and too high an iodine number. In fact it hardly complied with one of the U. S. P. requirements and was a very inferior product.

Reported by J. G. ROBERTS.

ADEPS LANAÆ (ANHYDROUS): One lot was of U. S. P. quality except that it had a low iodine value and contained slightly excessive amounts of ash and free acid. Another lot was entirely U. S. P., except its iodine value, which was only slightly below the U. S. P. minimum standard.

Reported by J. G. ROBERTS.

ALLSPICE: Three samples examined were all of normal quality.

Reported by C. H. LAWALL.

ALUM (POTASH): The rejection of one sample was recommended on account of its dirty color and the presence of pieces of wood and other foreign matter.

Reported by J. G. ROBERTS.

ARGOLS: A sample of white argols was found to contain about 84% of tartrates calculated as potassium bitartrate and a sample of red argols about 14%.

Reported by J. G. ROBERTS.

ASAFETIDA: One lot was found to contain rosin.

Reported by J. G. ROBERTS.

BELLADONNA LEAVES: Every shipment was of U. S. P. quality and contained 0.3% to 0.54% alkaloids.

Reported by J. G. ROBERTS.

BELLADONNA PLANT—WILD: A lot was examined which contained only traces of alkaloids.

Reported by C. GREEN.

BELLADONNA ROOT: One lot contained 11.64% of scopolia root. This lot did not conform to the U. S. P. requirement of not more than 10% of Belladonna stem bases or other foreign matter.

Reported by G. E'WE.

BELLADONNA STEMS: A sample was examined for academic interest only. It assayed 0.1443% mydriatic alkaloids.

Reported by C. GREEN.

BENZOIN, GUM: One lot contained only 59.5% alcohol-soluble matter whereas the U. S. P. requires 75%. The foreign matter consisted chiefly of wood.

Reported by N. SUTO.

BISMUTH SUBGALLATE: One lot contained an excess of sulphate.

Reported by J. RAHN.

BISMUTH TRIBROMOPHENOLATE: One lot was grayish yellow, assayed 62.1% Bi_2O_3 and possessed a strong odor of tri-brom-phenol. This was not satisfactory and was rejected.

Reported by G. E'WE.

BROOM TOPS: One lot contained 8% of stems.

Reported by G. E'WE.

CALCIUM CARBONATE—PRECIPITATED: Two of the five lots examined were not of U. S. P. quality. One was 4.3% low in strength and the other contained about 25 times more water-soluble material than is permitted by the U. S. P.

Reported by J. G. ROBERTS.

CALCIUM GLYCEROPHOSPHATE: One lot contained slight excess of chlorides and of sulphates.

Reported by J. RAHN.

CALCIUM OXIDE (MEDICINAL): One lot was rejected because it was air-slaked.

Reported by G. E'WE.

CAPSICUM: Fifteen samples examined were all of normal quality.

Reported by C. H. LAWALL.

CASCARILLA BARK: One lot offered was very poor. It contained excessive dirt and in addition some pebbles, shells, berries and nails. Another lot was practically devoid of odor.

Reported by G. E'WE.

CELERY SEED: Two lots yielded, respectively, 8.61% and 9.43% of ash which amounts are in excess of the U. S. P. limit of 8%, but within the U. S. Dept. of Agriculture standard of not more than 10%.

Reported by J. G. ROBERTS.

CELERY SEED: Five samples examined were all of good quality.

Reported by C. H. LAWALL.

CHARCOAL, ANIMAL (PURIFIED): One lot contained 6.9% ash. The U. S. P. VIII allowed only 4% ash.

Reported by F. KEENAN.

CHLOROFORM: A trace of free chlorine was found in one lot. Two other lots had specific gravities a little higher than the U. S. P. standard which fact was probably due to the absence of a requisite amount of alcohol.

Reported by J. G. ROBERTS.

CINCHONA, YELLOW (BRAZILIAN): Three lots assayed 1.73, 2.14 and 3.62% total alkaloids, respectively.

Reported by G. E'WE.

CINNAMON: All of the seven samples examined were satisfactory.

Reported by C. H. LAWALL.

"CITRON, ESS:" A sample, so labeled, was Oil of Lemon of U. S. P. quality.

Reported by S. DUBELL.

CLOVES: The six samples examined were of standard quality.

Reported by C. H. LAWALL.

COCOA: Twenty samples, all O. K. Two had the unusually low fat content of 12% but were normal in every other respect. Reported by C. H. LAWALL.

CODEINE SULPHATE: Two lots were a little yellow in color.

Reported by J. G. ROBERTS.

COLCHICINE: Two lots contained 12.35 and 13.4% respectively, of volatile matter at 100° C. The volatile matter consisted largely of chloroform. Colchicine should not lose more than 5% of its weight at 100° C. Reported by G. E'WE.

COPPER SULPHATE: The examination of a broker's sample showed the presence of a large excess of foreign metals. It appeared to be a good technical grade.

Reported by J. G. ROBERTS.

CORIANDER: Out of 8 samples examined, 3 were found to contain foreign starch (leguminous) from weed seeds not removed by cleaning. Reported by C. H. LAWALL.

CREOSOTE, BEECHWOOD: One was turbid in U. S. P. glycerin test.

Reported by S. DUBELL.

CREOSOTE, CARBONATE: One sample had a specific gravity slightly below the U. S. P. standard but was otherwise of U. S. P. quality. Reported by J. G. ROBERTS.

DAKIN'S SOLUTION: The examination of sixteen lots showed them to contain in 100 mls, 0.34 Gm. to 0.512 Gm. of chlorine, calculated as sodium hypochlorite. Five of them contained less than 0.45 Gm. which is considered as the minimum standard.

DAMIANA LEAVES: One lot was rejected because it contained a considerable proportion of pebbles. Another lot consisted practically entirely of stems.

Reported by G. E'WE.

DIASTASE: This sample was found to show only a little over $\frac{3}{4}$ of the U. S. P. starch digesting power. It was not soluble in water, as is required by the U. S. P. standard, but showed over 30% of insoluble matter which under the microscope was seen to be starch granules.

Reported by J. G. ROBERTS.

DIASTASE: Two samples were examined having about one-half the U. S. P. digestive power and containing about 50% insoluble matter, mainly starch. The samples consisted of powdered malt, in all probability.

Reported by C. H. LAWALL.

GALEGA: Two lots were rejected because of too much stems.

Reported by B. HOFFSTEIN.

GAMBIR: Some lots continue to come in in a soft mass condition due to excessive moisture whereas the U. S. P. requires Gambir to be dried to the friable stage.

Reported by G. E'WE.

GINGER: Six samples were all of good quality.

Reported by C. H. LAWALL.

GELATIN: Out of 10 samples of powdered gelatin examined, 5 were found to contain excessive amounts of sulphur dioxide and arsenic to the extent of over 2.5 parts to the million, also in excess.

Reported by C. H. LAWALL.

GLYCERIN: Most of the glycerin examined was of good quality. Two lots had specific gravities a little lower than the standard. One had a decided yellow color and contained more than the permissible amount of carbonizable impurities. Four lots were of U. S. P. quality in every respect.

Reported by J. G. ROBERTS.

HELLERORE: The only lot examined was found to contain 1.75% alkaloids.

Reported by J. G. ROBERTS.

HYOSCYAMUS: Not one of the lots examined was of U. S. P. quality. One broker's sample was not the U. S. P. variety. Three other shipments were deficient in alkaloids as they contained only 0.033% to 0.054% whereas the U. S. P. requires the presence of not less than 0.065%.

Reported by J. G. ROBERTS.

IPECAC: Both shipments received were of U. S. P. quality and yielded 2.28% and 1.84%, respectively, of alkaloids.

Reported by J. G. ROBERTS.

IPECAC STEMS: Two lots examined because of academic interest were found to contain 1.71% and 1.89%, respectively, of ether-soluble alkaloids.

Reported by C. GREEN.

IRON, REDUCED: Practically all of the reduced iron examined during the past year contained sulphides in excess of the U. S. P. allowance and some of the lots contained shining particles of iron suggesting the probability that ordinary powdered iron was present.

Reported by N. SUTO.

KINO: Two samples yielding the following results were examined:

| Sample. | O. | F. |
|------------------------------------|--------|--------|
| Appearance..... | Normal | Normal |
| Moisture..... | 14.45% | 14.31% |
| Ash..... | 2.04% | 4.92% |
| Proportion soluble in alcohol..... | 22.14% | 36.33% |

Neither of these samples was of U. S. P. quality as they contained more than 12% of moisture and did not yield 45% of alcohol-soluble matter as required by the U. S. P. Sample marked F also yielded 1.92% excess of ash.

Reported by J. G. ROBERTS.

KOLA NUT: Two lots contained 1.63% and 1.54%, respectively, of caffeine which are within the N. F. limit of not less than 1.5%.

Reported by J. G. ROBERTS.

LEAD ACETATE (POWDERED): This shipment was not of U. S. P. quality as it contained an excess of carbonate and was considerably effloresced. Its strength according to the U. S. P. method was found to be 93.53% whereas the U. S. P. maximum limit is 89.57% of anhydrous lead acetate.

Reported by J. G. ROBERTS.

LIQUOR CALCIS: One sample from a drug store giving it away free of charge, was found to be nothing but tap water.

Reported by C. H. LAWALL.

LITHIUM BENZOATE: A sample, so labeled, received from a prominent firm consisted of barium hydrate.

Reported by G. E'WE.

LYCOPodium: An excess of ash was found in one lot which was otherwise of U. S. P. quality.

Reported by J. G. ROBERTS.

MACE: Out of 10 samples examined, 4 were slightly above the 30% maximum figure for non-volatile ether extract.

Reported by C. H. LAWALL.

MAGNESIUM CARBONATE: An excess of 0.44% and 0.14% of calcium calculated as calcium oxide was found in two lots which complied with all other U. S. P. conditions.

Reported by J. G. ROBERTS.

MAGNESIUM CARBONATE: Out of 5 samples examined two contained over 5% of CaCO_3 and over 0.25% Fe_2O_3 .

Reported by C. H. LAWALL.

MANGANESE DIOXIDE, PRECIPITATED, U. S. P.: One lot contained 2.32% insoluble matter. The U. S. P. allows only 0.2%.

Reported by G. E'WE.

MARJORAM: Sixteen samples examined, 7 of which were found to contain over 10% of foreign leaf fragments.

Reported by C. H. LAWALL.

MERCURY BENZOATE: Two lots did not answer the following N. & N. R. 1918 requirements: "At 20° C. a 10% solution of sodium benzoate dissolves 1% of its weight of mercuric benzoate." A large liberation of benzoic acid occurred during the application of the test.

Mercuric benzoate is commonly prepared for hypodermic use by solution in normal saline solution. Two lots contained between 1 and 2% of matter which was insoluble in normal saline solution.

Reported by C. GREEN.

NUTMEG: The six samples tested were all satisfactory.

Reported by C. H. LAWALL.

NUX VOMICA: Two lots contained, respectively, 2.34% and 2.22% of alkaloids which are below the U. S. P. standard of not less than 2.5% alkaloids.

Reported by J. G. ROBERTS.

OIL, CASTOR: Four samples of good quality gave the following acid numbers: 1.54, 1.61, 1.59 and 1.63.

Reported by J. G. ROBERTS.

OIL OF DILL: This oil was obtained by distilling a lot of siftings that were left after cleaning a shipment of dill seed. The oil upon examination gave the following results:

| | |
|--------------------------------|--------|
| Appearance..... | Yellow |
| Sp. gr. at 15° C..... | 1.01 |
| Optical rotation at 20° C..... | +34.9° |

As oil of dill is not recognized by the U. S. P. or the N. F. the results obtained in this examination were compared with the standards given in the B. P. It was found, however, that it did not meet the requirements given therein as the specific gravity was higher than the B. P. standard of 0.900 to 0.915 at 15.5° C. and its optical rotation lower than the standard of +70°

to $+80^{\circ}$ at 20° C. In view of the foregoing facts it was considered that the oil was not of normal quality on account of differing so appreciably from the standards.

Reported by J. G. ROBERTS.

OIL OF LEMON, EXTRA STRONG: Assayed 20.5% citral.

Reported by G. E'WE.

OIL OF LEMON, TERPENELESS: Two lots assayed 28.6% and 26.7% of citral, respectively.

Reported by G. E'WE.

OIL, RATTLESNAKE: The following data was obtained with one lot:

| | |
|--------------------------------|-------|
| Sp. gr. at 25° C..... | 0.919 |
| Iodine value..... | 102.3 |
| Saponification value..... | 202.1 |

The sample corresponds closely with the published factors for genuine rattlesnake oil and was considered authentic.

Reported by J. G. ROBERTS.

OIL OF SASSAFRAS: Sample was of U. S. P. quality with the exception that it did not comply with the optical rotation standard of $+3^{\circ}$ to $+4^{\circ}$. The U. S. P. VIII permitted the use of sassafras oil with an optical rotation as low as this one as it merely required that the rotation should be not above $+4^{\circ}$. In the past six years we have examined eight lots which had the following optical rotation: $+2.03^{\circ}$, $+3.83^{\circ}$, $+2.48^{\circ}$, $+1.59^{\circ}$, $+2.16^{\circ}$, $+2.9^{\circ}$, $+2.55^{\circ}$ and $+3.9^{\circ}$.

Six of these are below $+3^{\circ}$ and two are above.

Reported by J. G. ROBERTS.

OIL OF SWEET ORANGE: One lot was dark in color but fine in odor and answered all U. S. P. requirements.

Reported by G. E'WE.

OLIVE OIL: Three out of 8 samples examined consisted of cottonseed oil. None of the adulterated samples came from drug stores.

Reported by C. H. LAWALL.

PAPAIN: All the papain tested during the past year was low in proteolytic power. None assaying more than 1 to 4.7.

Reported by G. E'WE.

PAPRIKA: Twelve samples were all of good quality.

Reported by C. H. LAWALL.

PEANUT BUTTER: As it was suspected that this product contained ground glass, added with malicious intent, it was examined both macroscopically and chemically for mechanical matter. No glass was found, however, with either method. The sample yielded 0.3% of ash insoluble in hot dilute hydrochloric acid and 0.38% of insoluble matter left after oxidation of organic matter with sulphuric acid and potassium sulphate. The presence of glass was probably suspected on account of the presence of coarse salt.

Reported by J. G. ROBERTS.

PEPPER, BLACK, GROUND: The twenty-one samples tested all complied with the standards.

Reported by C. H. LAWALL.

PEPPER, WHITE, GROUND: Eleven samples examined were all satisfactory.

Reported by C. H. LAWALL.

PETROLATUM (LIQUID): The rejection of a three-drum lot was recommended because it contained an excess of carbonizable impurities and had a slight taste of kerosene.

Reported by J. G. ROBERTS.

PETROLATUM, LIQUID, U. S. P.: A few samples contained excessive carbonizable impurities.

Reported by G. E'WE.

PHYSOSTIGMA: The alkaloidal content of one lot was 0.14% which is a trifle under the U. S. P. standard of 0.15%.

Reported by J. G. ROBERTS.

POTASSIUM CARBONATE: One lot was 5% low in strength, contained a trace of earthy impurities and was dirty. It contained practically no sodium when tested quantitatively and a normal amount of arsenic according to the general test of the U. S. P.

Reported by J. G. ROBERTS.

POTASSIUM PERMANGANATE: Three lots were rejected because of excessive water-insoluble matter.

Reported by G. E'WE.

POTASSIUM NITRATE: Two lots were of U. S. P. quality except that they had a yellowish color.

Reported by J. G. ROBERTS.

POTASSIUM PERMANGANATE: All of the shipments examined complied with the standards of the U. S. P. except that they had a decided bronze luster. The U. S. P. requires potassium permanganate to have a dark purple color.

Reported by J. G. ROBERTS.

QUININE FORMATE: Melting intervals vary. Three lots had following melting intervals, respectively: 120-122° C., 124-126° C. and 145-150° C.

Reported by G. E'WE.

RENNIN 1-30,000: The rejection of one shipment was recommended because its coagulating power was less than $\frac{1}{2}$ of that claimed on the label when tested according to the method of the N. F.

Reported by J. G. ROBERTS.

RENNIN: Continues to vary greatly. Seven lots assayed as follows: 1 to 10,500, 1 to 12,500, 1 to 15,625, 1 to 16,666, 1 to 16,666, 1 to 26,000 and 1 to 41,000.

Reported by G. E'WE.

SAFFRON: Seven samples were all of N. F. quality.

Reported by C. H. LAWALL.

SAGE: Out of 7 samples examined 4 were found to contain an excess of stems, in two cases the stems amounting to over 50% of the samples.

Reported by C. H. LAWALL.

SALOL: Sample was of U. S. P. quality with the exception that it had a yellowish color. This condition seems to have become chronic as considerable of the salol seen on the market is in that condition.

Reported by J. G. ROBERTS.

SANGUINARINE NITRATE: Continues to vary greatly. The 4 lots examined assayed 51.4, 53.0, 94.2 and 98.7%, respectively.

Reported by F. KEENAN.

SAVORY: Out of 3 samples submitted, one contained an excess of stems (24%).

Reported by C. H. LAWALL.

SCAMMONY, RESIN: One lot contained only 90.6% ether-soluble matter. The U. S. P. requires 95%.

Reported by G. E'WE.

SENEGA: One shipment was considered unsatisfactory because it contained 30% of stems instead of 5% as required by the U. S. P. and only 0.22 Gm. of ether-soluble matter from 5 Gm. of drug instead of 0.3 Gm. as required.

Reported by J. G. ROBERTS.

SOAP, SOFT: Four lots were practically neutral, inclining toward acidity, whereas the U. S. P. requires soft soap to be faintly alkaline.

Reported by G. E'WE.

SODIUM BENZOATE: The U. S. P. sanctions the use of synthetic benzoic acid and requires benzoic acid to be tested for chlorine because chlorine is a possible impurity in synthetic benzoic acid. Synthetic benzoic acid can be and probably is used to manufacture sodium benzoate, yet the U. S. P. evidently by oversight neglects to direct the application of a test for chlorine to sodium benzoate or benzoic acid recovered from it. None of the sodium benzoate tested during the past year contained chlorides.

Reported by G. E'WE.

SOLUTION HYDROGEN PEROXIDE: Every lot examined was of U. S. P. quality except that one lot had a slight excess of non-volatile matter and two lots a slight excess of free acid.

Reported by J. G. ROBERTS.

SOLUTION MAGNESIUM CITRATE: Two out of 5 samples were found to be low in amount of magnesium citrate present.

Reported by C. H. LAWALL.

STORAX, LIQUID: There appears to be no strictly U. S. P. liquid storax on the market. Some lots are marked "not U. S. P." Eight lots had the following characteristics:

| Sample. | Alcohol sol. | Alcohol insol. | Ash. | Acid value. | Sapon. val. |
|-------------------|--------------|----------------|-------|-------------|-------------|
| 1..... | 84.08 | 0.86 | 0.45 | 155 | 193.5 |
| 2..... | 87.0 | O. K. | 0.35 | 144 | 196 |
| 3..... | 87.5 | O. K. | 0.04 | 155 | 212 |
| 4..... | 90.8 | 0.18 | None | 41 | 167 |
| 5..... | 91.1 | 1.62 | 0.72 | 118.7 | 181 |
| 6..... | O. K. | O. K. | O. K. | 171.7 | O. K. |
| 7..... | O. K. | 1.6 | O. K. | 122.3 | 163 |
| 8..... | 91.0 | 7.37 | O. K. | 118.5 | 166.5 |
| U. S. P. req..... | 60 | 2.5 | 1% | 56-85 | 170-230 |

Sample No. 4 was labeled "American" and was clear and light yellow in color instead of turbid and brownish.

Reported by G. E'WE.

STRAMONIUM LEAVES: Two lots contained, respectively, 0.39% and 0.3% of alkaloids.

Reported by J. G. ROBERTS.

SUGAR (CANE): A grossly adulterated lot was found to contain 21% of sodium chloride.

Reported by J. G. ROBERTS.

SUGAR, CORN: All of the solid corn sugar examined during the past year was free from barium, arsenic and heavy metals. Reported by G. E'WE.

SULPHUR (PRECIPITATED): Three of the five lots examined were not as represented. One was found to be washed sulphur and two yielded exceedingly high amounts of ash. One of these was of Japanese origin and yielded 46.4%. The other yielded 45.1% whereas the U. S. P. permits not more than 0.3%. Reported by J. G. ROBERTS.

TERRA ALBA: All of the terra alba examined during the past year consisted of non-setting calcium sulphate. Reported by G. E'WE.

THYME: Three samples, one containing an excess of stems (17%).

Reported by C. H. LAWALL.

TINCTURE OF IODINE: The rejection of one lot was recommended because it contained only 6.14 Gm. of iodine in 100 mls instead of not less than 6.5 Gm. nor more than 7.5 Gm. as required by the U. S. P. Reported by J. G. ROBERTS.

VERDIGRIS: The following amounts of copper calculated as copper oxide were found in the samples given below:

| | Sample No. | Copper oxide. |
|----------------------|------------|---------------|
| Blue Verdigris..... | 1 | 38.49% |
| Green Verdigris..... | 2 | 32.91% |
| Green Verdigris..... | 3 | 37.80% |

Reported by J. G. ROBERTS.

WILD LETTUCE: One lot was rejected because of excessive proportion of midrib.

Reported by B. HOFFSTEIN.

WINTERGREEN LEAVES: One lot was rejected because of excessive proportion of stems. Reported by G. E'WE.

ZINC: This lot was stated to be arsenic free but upon examination was found to be of unsuitable quality as it contained a decided trace of arsenic. It complied with the requirement as given under the ordinary U. S. P. zinc but it was not suitable for U. S. P. reagent zinc as it yielded more than "a scarcely perceptible stain" when tested according to the method given. Reported by J. G. ROBERTS.

ZINC OXIDE: Sample contained an excess of heavy metals which, however, is not an unusual condition as most zinc oxide examined by us has contained excessive amounts. This sample contained 0.16% of lead calculated as lead oxide and compares favorably with the lowest amount found in various samples. During the past three years the samples examined have contained 0.09% to 0.44% of lead calculated as lead oxide. Reported by J. G. ROBERTS.

ZINC OXIDE: Of 8 samples examined but 2 responded to the U. S. P. heavy metal test. Reported by C. H. LAWALL.

ZINC OXIDE: Nine lots contained excessive heavy metals ranging from 0.05 to 0.236% calculated as metallic lead. Reported by G. E'WE.

ZINC PERMANGANATE: One lot was rejected because of the presence of a large proportion of water-insoluble matter. Reported by G. E'WE.

The Following Table Shows the Results of 131 Crude Drug Assays made in the Analytical Laboratory of the H. K. Mulford Company during the Year June 1, 1917-June 1, 1918.

| Drug | No of samples. | Lowest assay. | Highest assay. | Average. | Standard | Number. | |
|----------------------|----------------|---------------|----------------|----------|-----------------------|---------|--------|
| | | | | | | Above. | Below. |
| Aconite Leaves.. | 3 | 0 37% | 0 51% | 0 460% | 0 2% ether-sol. alks. | 3 | 0 |
| Aconite Root | 3 | 0 33% | 0 49% | 0 414% | 0.5% ether-sol. alks. | 0 | 3 |
| Belladonna Leaves. | 8 | 0 31% | 0 79% | 0 450% | 0 3% alkaloids | 8 | 0 |
| Belladonna Root | 8 | 0 40% | 0 710% | 0 530% | 0.45% alkaloids | 6 | 2 |
| Cantharides, Chinese | 3 | 1 08% | 1 90% | 1 60% | 0 6% cantharidin | 3 | 0 |
| Cinchona, red | 6 | 5 55% | 10 0% | 7 70% | 5% alkaloids | 6 | 0 |
| Cinchona, yellow | 3 | 6 01% | 9 38% | 7 46% | 5% alkaloids | 3 | 0 |
| Coca Leaves. | 2 | 0 73% | 1 14% | 0.93% | 0.5% alkaloids | 2 | 0 |

| Opium, Powdered..... | 9 | 9.98% | 10.50% | 10.16% | 10% anhydrous morphine | 8 | 1 |
| Pilocarpus..... | 1 | 0.67% | 0.67% | 0.67% | 0.6% alkaloids | 1 | 0 |
| Podophyllum..... | 7 | 3.10% | 6.70% | 4.31% | 3% resin | 7 | 0 |
| Sanguinaria..... | 2 | 3.37% | 3.95% | 3.66% | 2.5% alkaloids | 2 | 0 |
| Stramonium Leaves..... | 4 | 0.12% | 0.30% | 0.23% | 0.25% alkaloids | 3 | 1 |
| Stramonium Seed..... | 2 | 0.238% | 0.278% | 0.258% | 0.25% alkaloids | 1 | 1 |
| Totals..... | 131 | | | | | 113 | 18 |

COMPARISON WITH REPORTS PREVIOUSLY SUBMITTED.

| Year. | Total. | Above. | Below. | Percent. above. |
|------------------|--------|--------|--------|-----------------|
| 1909 Report..... | 395 | 313 | 82 | 79.3 |
| 1910 Report..... | 340 | 291 | 49 | 85.6 |
| 1911 Report..... | 263 | 224 | 39 | 85.1 |
| 1912 Report..... | 298 | 235 | 63 | 78.8 |
| 1913 Report..... | 382 | 264 | 118 | 69.1 |
| 1914 Report..... | 286 | 221 | 65 | 77.2 |
| 1915 Report..... | 133 | 98 | 35 | 73.6 |
| 1916 Report..... | 214 | 156 | 58 | 72.9 |
| 1917 Report..... | 172 | 147 | 25 | 85.3 |
| 1918 Report..... | 131 | 113 | 18 | 86.8 |

Last year practically none of the averages ran below standard. This year only aconite root, hyoscyamus and stramonium leaves ran below standard but only very slightly below. The general yearly average 86.8%, is the best yet recorded and is a very satisfactory indication that the general quality of drugs on the market is excellent, in spite of war conditions.

CORRESPONDENCE

EXPRESSES APPRECIATION OF THE JOURNAL.

FAJARDO, PORTO RICO.

JULY 16, 1918.

MR. W. B. DAY,
GENERAL SECT. OF THE AMERICAN PHARM. ASSOCIATION,
701 S. WOOD ST., CHICAGO, ILL.

MY DEAR MR. DAY:

At the kind invitation of my friend and fellow pharmacist, Mr. Rudolph Wirth, of the firm E. Fougere & Co. of New York, I take the liberty of soliciting admission as a member of the American Pharmaceutical Association, enclosing herewith postal money order for \$5.00 in payment of rights for one year, including subscription to the JOURNAL. Mr. Wirth has been so kind as to send me a copy of the June number of the JOURNAL, and I can assure you that same was a most agreeable surprise, said JOURNAL being new to me; in my estimation it is an ideal aid to pharmacists who like myself are obliged to live distanced from scientific centers and institutions, where new methods are obtained, and where a better knowledge of the profession can be facilitated. The literature comprised in this JOURNAL is excellent, being instructive and interesting to a degree, being really a monthly conference, demonstrating scientifically and practically the highest methods of technics, high pharmacy and chemistry, and in fact to all that which directly pertains to pharmaceutical science.

The petitioner is a graduate in pharmacy of the New York College of Pharmacy, class of 1902, having had four years' practice in the City of New York, first as a pharmacist of the Roosevelt Hospital, and afterwards with the corporation of Hegeman & Co.; since 1906 have resided in Porto Rico, where I am established with my father, Dr. Jose A. Veve, in the drug business. Also the petitioner holds a license of the New York Board of Pharmacy.

Considering your consent and aid on this occasion a premium of inestimable value, I beg to remain,

Very respectfully yours,

(Sgd.) MIGUEL A. VEVE, PH. C.

EDITOR, JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

Why is it that when one writes a prescription thus:

R Strontii Bromidi $\bar{\text{S}}$ i

(Specified brand)

Tr Cardam Comp.

Tr. Nucis Vom aa $f\bar{\text{S}}$ i

Aquae q. s. ad $f\bar{\text{S}}$ iii

the druggist calls you up to say that you have a 3-ounce mixture without the water! Or worse yet, that when you write

R Strontii Bromidi $\bar{\text{S}}$ iv

(Specified brand)

Elix Aromat. $f\bar{\text{S}}$ i

Aquae qs. ad $f\bar{\text{S}}$ ii

the druggist dispenses $\frac{1}{2}$ fluid ounce of a solution instead of the $\frac{1}{2}$ ounce of salt you have written for. These things happen constantly.

I do not give the name of the specified brand in this letter for obvious reasons. But why should it make any difference to a druggist who knows how to read a prescription? And how can I guard myself and my patients against the careless druggist? Surely $\bar{\text{S}}$ iv is not $f\bar{\text{S}}$ iv and Strontii Bromidi is not Liquor Strontii Bromidi!

Yours truly,

S. SOLIS COHEN, M.D.

In answering Doctor Cohen it was stated, that a pharmacist should and usually does understand the difference between a fluid ounce and an ounce by weight.

One part of strontium bromide is soluble in 0.35 part of water, and 60 grains of the salt dissolved in 60 minims of water produce practically a volume of 100 minims. Or, if one ounce of the salt is dissolved in $4\frac{1}{2}$ fluidrachms of water about one fluid ounce of liquid results.

The brand of the salt has nothing to do with the case. It is a matter which requires an explanation from the compounder. Evidently there has been a recurrence of the error and on request of Doctor Cohen we are printing his letter and the substance of our reply.

RESOLUTIONS PASSED AT THE ANNUAL CONVENTION OF THE INTERNATIONAL ASSOCIATION OF ROTARY CLUBS IN THE INTEREST OF PHARMACEUTICAL CORPS IN THE ARMY AND NAVY.

WHEREAS, We believe that one of the most important duties devolving upon the governmental authorities is to provide to the utmost for the conservation of the lives and health of the American soldiers, who, sacrificing the comforts of home, are jeopardizing their all for the principles for which the nation is contending, and as our loved ones, and as the soldiers of our country, they are certainly entitled to the very best medical and surgical skill and to expert pharmaceutical service. It is deplorable that in the United States Army medicines are continuously dispensed by those who are unfitted for such duty and who lack a systematic education in the knowledge of drugs and the art of compounding medicines.

WHEREAS, While in civil life each state protects its citizens from incompetent practice, and by law provides for the required experience, education, examination and licensure of those entrusted with the dispensing of medicines, nevertheless the military authorities of the nation ignore the necessity for a like protection for the soldiers and permit potent, and even the most toxic drugs, to be dispensed by incompetent men without any pharmaceutical experience or education. To continue such practice is to continue to invite calamities and to perpetually expose those in the military service to untoward accidents and untimely deaths.

WHEREAS, It is regrettable that the United States with its progressive spirit and commanding position and its enormous resources should in this respect be found lagging and to have a medical department of the army not fully abreast with medical departments of the armies of other nations. In the armies of France, Germany, Austria, Japan, Italy, Spain, Belgium, Holland, Switzerland, Norway, Sweden, and in the colonial armies of Australia and Canada, there are organized pharmaceutical corps with recognized commissions and responsibilities aiding ably the medical officers in safeguarding the troops in these armies. The United States, that can well afford to give to the men in her military service the best, should not do less than these other nations; yet we have, at present, no pharmaceutical corps in either the army or navy.

Therefore, It is Resolved by the Ninth Annual Convention of the International Association of Rotary Clubs, that the establishment of a pharmaceutical corps in the United States Army as proposed by Bill H. R. No. 5531, introduced by Hon. George W. Edmonds of Philadelphia, and now pending before the Committee on Military Affairs of the House of Representatives, be endorsed. We urge that the medical department of the army be speedily reorganized to permit of this needed additional safeguard to our soldiers, and to guarantee to the men in the military service the same efficient pharmaceutical service that the States assure in civil life and that is now so generally vouchsafed to the armies of most of the other nations.

RECOGNITION OF PHARMACY.

An editorial in the *Pennsylvania Medical Journal* for June reads in part as follows:

"Practically every state of the Union has a law which provides that those who furnish drugs to the public shall be qualified for this professional work. In our Army, the hospital steward who dispenses the medicines ordered by the physician for the sick soldier is detailed from the ranks without requirement of pharmaceutical training.

"To remedy this defect and thus increase the efficiency of the Medical Department of the Army, it is proposed to establish a Pharmaceutical Corps. As is the case with the Dental Corps, the Sanitary Corps and the Ambulance Corps, this corps is to be under the command of the Surgeon-General of the Army.

"To provide for this recognition of pharmacy, Representative Edmonds of Pennsylvania last July introduced into the House of Representatives a bill to increase the efficiency of the Army, to provide a Pharmaceutical Corps in that department, and to improve the status and efficiency of the pharmacists of the Army."

Then follows a synopsis of the Bill and part of the concluding statements of the editorial are:

"It goes without saying that the efficiency of the Medical Department will be increased if trained and experienced pharmacists purchase (or manufacture), test and dispense the drugs selected and prescribed by the medical men. Also, though the pharmacist is not trained to render medical aid nor, except in isolated instances, to do chemical or bacteriological work, his familiarity with drugs should make him of considerable assistance 'in rendering first aid in wound treatment and the making of diagnostic and chemical tests.' The provision 'to establish and maintain a systematic course of study,' for those seeking promotion, follows the example set by the Army in establishing the Army Medical School, of the Navy in establishing the Naval Medical School and of the United States Public Health Service in providing courses of instruction to the men in the service and should do much to elevate the status of pharmacy.

"Altogether the establishment of a Pharmaceutical Corps, through the enactment of the Edmonds Bill or some similar measure, should make for greater efficiency in the Medical Department of the Army. Further, the commercial training of the pharmacist should also make for economy."

A PHARMACEUTICAL CORPS FOR THE ARMY.

An editorial in the *Missouri State Medical Journal* for July reads:

"The present world war is stopping the onward march of civilization in many directions; it is even forcing disorganized retreat that will require decades to recover. But, on the other hand, the stress is making science, arts and industry accomplish a ten-year advance in one year.

"In the United States it is bringing about a realization that the time of isolation with untold possibilities is past, and that the life of the individual and of the nation must be patterned so as to permit competition with the wide world. One result is that abuses and wrongs which in peace would have taken a decade of legislation to correct, are now adjusted in a single session of Congress.

"In former days, the surgeon's apprentice handed out to his master's patients the desired decoctions and boluses; a similar situation exists today in the Medical Department of the Army, which is forced to depend on untrained men to perform the services that in private life the professionally trained pharmacist is required to perform. However, the cry for still greater efficiency in the Medical Department of the Army gives promise that ere long a corps of professionally trained pharmacists will be placed under the command of Surgeon-General Gorgas."

Then follows a synopsis of the Edmond's Bill.

SULPHUR INDUSTRY TAKEN OVER BY THE GOVERNMENT.

The sulphur industry of the United States passed into Government control July 9. Production and distribution of the mineral will, with the approval of the President, be administered by the War Industries Board. The action was necessitated by the increased war demands for sulphur as an ingredient in explosives, and by the increasing burdens of the rail and water systems in transportation of war materials.

A. E. Wells, consulting engineer of the War Department, has stated that it would be possible to develop a comparatively swift source of supply by the thio-gen process of reclaiming sulphur from the smelter fumes, and that it

would be possible to erect two plants with a capacity of 500 tons a day to come into operation within a few months.

Present sources of sulphur supply are from two mines: one in Louisiana, producing over 3,500 tons of sulphur a day, and another in Texas, producing in excess of 1,000 tons a day. Minor properties in Nevada, Utah and Wyoming produce about sixty tons a day combined. Present sulphur consumption in the United States exceeds 125,000 tons per month, and Mr. Wells has stated that this will increase to over 150,000 tons per month before the end of the year, due to increased Government use.

AIDS IN THE USE OF DAKIN-CARREL TREATMENT.

Dr. Max Bornstein, of Milwaukee, Wis., describes a glass automatic siphon for delivering a definite amount of fluid to a wound at a definite period of time, in *Journal A. M. A.*, June 15, 1918, p. 1820. The apparatus is shown in Figure 1; the periodicity of flushing is regulated by a Hoffman pinch-cock on the tubing between the solution tank and the apparatus. Two bells (*A* and *B*) annealed one to the other are connected by a siphon tube (*C*). A drip point is annealed into the upper end of the upper chamber. Both chambers have air vents.

The apparatus works as follows: Solution from an irrigating bottle or bag is allowed to pass a pinch-cock at a fixed rate. It accumulates in the upper chamber until it reaches the highest point of the siphon, when it suddenly is emptied by the siphon into the lower chamber. Here, by virtue of its height and its weight, it forces its way through the holes in the Carrel tube and flushes the wound. The flushing is periodic and eliminates the inconstant human element which is so often the cause of failure in the Dakin-Carrel technic.

Doctor Bornstein (First Lieutenant, M. R. C., U. S. Army) also has devised a suction drainage bell for applying Dakin-Carrel treatment in empyema, and is described in the same issue. This apparatus, Figure 2, consists of a flattened bell of glass, resting on a wide flange (*A*), where it comes in contact

with the skin around the wound opening. At the upper end of one diameter are two small tubular openings (*B*), for transmitting the usual Carrel tube into the wound cavity. One of these may be used for flushing the bell and for cleansing. On the opposite side is a large tubular opening (*C*) for carrying off drainage, by means of a rubber tube into a waxed or rubber bag. Also, to this latter opening may be applied vacuum suction in empyema cavities by connecting with a vacuum water suction pump. The apparatus is held in position by a rubber dam fitted on the flange and by adhesive. By its use one can save large quantities of dressings, a very important item. It prevents secondary contamination of the wound, and permits instillation of neutral solution of chlorinated soda. It allows for drainage which seeps out beside the Carrel tube; and in the urinary bladder, it does away with the constant overflow of foul smelling urine. In empyema it permits the use of negative pressure to expand the lung and hastens obliterations of the empyema cavity. A Furniss rubber empyema spool is a valuable aid. It is made of glass; can be removed easily for cleansing and boiling, and can be easily reappplied.

PARAFFIN PAPER AS A SURGICAL DRESSING.

Charles M. Harpster, Ph.G., M.D., of Toledo, Ohio, writing in the *Journal A. M. A.*, June 8, 1918, p. 1763, states that paraffin paper will be found an excellent dressing for burns or any other condition in which a non-adherent dressing is desirable. It is far superior to the paraffin dressing of burns by the spray method, is much more easily and rapidly applied, results in more rapid healing of the burned surface, and is more easily removed.

In the first stage of burns, when there is great pain, the various ointments now in use can be applied directly to the paraffin paper and this applied to the burned area after all vesicles have been opened. It has the advantage of excluding the air, which relieves

the pain of the burns, and it is readily removed at the time of redressing, leaving the developing granulations unaltered.

The first dressing of pure petrolatum on paraffin paper, is applied directly to the burn, and over this a layer of cotton and the usual bandage. As the paper is impervious to moisture, the serum that seeps from the injury runs away from the raw surface, and is absorbed by the outer dressings beyond the injury. There is no sticking to the burn or other wounds, when the dressings are removed. Experience has proved that dressings once in two or three days are sufficient in most cases. Certain cases, however, may require more frequent dressings.

Paper bandages, which are now being universally used, perhaps more through necessity than choice, have been found to work well in certain dry dressings. But the thought arose, what a great saving could be accomplished if they could be used on moist dressings or dressings in which there is considerable oozing or drainage. Here again, the paraffin paper can be utilized as a barrier between the moist dressings and the paper bandage. It has the desired effect of keeping the moisture inside the dressing, and prevents the paper bandage from becoming wet and tearing easily.

Dr. Harpster concludes the article by saying that an attempt is being made to have sterile packages of the paper put up and, that to an extent, the paper will replace oiled silk and rubber tissue, especially if a heavier coating of paraffin can be applied to the paper.

SKIN CANCER.

The *New Orleans Medical and Surgical Journal* states that perhaps the most frequent excitant of all causes, so far as skin cancer is concerned, is dandruff. If falls from the scalp, and lights on the ear, eyelids, nose, neck, lips and face, and if there is already a scaling spot, or a thickening, or a wart, a mole, or a gland ready to receive the dandruff scale, it sets this spot alive with activity and it goes on to form a skin cancer. Probably 60 percent of skin cancers are due to this cause, and many a cancer has been prevented and may be prevented by curing the dandruff or by preventing it.

INSOLUBILITY OF SOFT GELATIN CAPSULES.

Dr. F. W. Dersheimer, director of the work of the International Health Board in British Guiana, reports on experiments showing that soft capsules are relatively insoluble in the stomach. Comparative experiments were also made with hard capsules which proved that these completely dissolved in an acidified pepsin solution in twenty-one minutes, while the soft capsules similarly treated showed no signs of dissolving beyond slight softening after twenty-four hours. The experiments on which the reports are based were conducted with the support and under the auspices of the International Health Board of the Rockefeller Foundation. The article is printed in the *Journal A. M. A.*, for November 3, 1917, p. 1508. It would seem that this is a subject for further investigation.

PROTECTION AGAINST MUSTARD GAS.

Protection against any of the gases now in use by the Germans is given to American soldiers by the masks now being worn. Statements that American masks do not protect soldiers from the effects of mustard gas are not warranted, according to an official statement from the Chemical Warfare Section authorized by the War Department.

The masks now worn will protect soldiers as long as they are required to remain in areas drenched by gas. The clothing worn by the soldiers will resist the effects of the gas for a normal period. As an added precaution, the soldiers are now provided with a neutralizing ointment to be rubbed on those parts of the body where mustard gas is likely to penetrate through the clothes.

OFFICIAL NAMES FOR LICENSED DRUGS.

Prof. Julius Stieglitz, chairman of the Subcommittee on Synthetic Drugs, National Research Council, on behalf of the committee, urges the use of the official names of licensed drugs, and if the proprietary brand name is to be used to place this side by side with the official name. The official names so far adopted by the Federal Trade Commission are:

Arsphenamine for the drug marketed as Salvarsan, Diarsenol and Arsenobenzol, etc.

Neoarsphenamine for the drug marketed as Neosalvarsan, Neodiarsenol and Novarsenobenzol, etc.

Barbital for the drug marketed as Veronal.

Barbital-Sodium for the drug marketed as Medinal and Veronal-Sodium.

Procaine for the drug marketed as Novocaine.

Procaine Nitrate for the drug marketed as Novocaine Nitrate.

Phenylcinchoninic Acid for the drug marketed as Atophan.

AMERICAN CASTOR OIL.

According to Government reports the biggest castor oil mill in the world will be in operation this month at Gainesville, Fla. Reports from Florida are fully up to expectations and Texas will have a yield as large as has been counted upon.

W. S. Glynn-Jones, M. P., has been elected Secretary of the Pharmaceutical Society of

W. S. GLYNN-JONES

Great Britain. Mr. Glynn-Jones was elected member of the House of Commons in 1910.

He is the author of "The Law of Poisons and Pharmacy," and has been active in British legislation relating to pharmacy.

William Kirkby, elected president of the British Pharmaceutical Conference, is the son of a pharmacist and obtained his degree of pharmaceutical chemist in 1882. In 1886 he became associated with Jewsbury and Brown.

WILLIAM KIRKBY

New President British Pharmaceutical Conference

He has been active in pharmaceutical affairs of Great Britain and is well known for his work in historical research.

Charles H. LaWall, president-elect of the American Pharmaceutical Association, has been invited to become a member of an Advisory Board to the Division of Medical Industry.

OBITUARY.

CHARLES FORD DARE.

Charles F. Dare, engaged in the drug business in Bridgeton, N. J., since 1872, died May 16, 1918. The deceased was born in Bridgeton, May 19, 1842, and the funeral services were held on the anniversary day of his birth.

Mr. Dare graduated March 1861, from the Philadelphia College of Pharmacy; this same year he entered the service as hospital steward

and served in that capacity to the end of the Civil War. On his retirement from the Army he entered the employ of Edwin F. Brewster, and in 1872 engaged in business on his own account. For a number of years his son Charles W. has been a member of the firm.

Mr. Dare was a director of the Bridgeton National Bank, secretary of the Merchants and Mechanics Building and Loan Association. He was member and officer in the First

Presbyterian Church of Bridgeton and affiliated with the Masonic bodies and Odd Fellows. He joined the New Jersey Pharmaceutical Association in 1874, was secretary for several years and its president in 1895. He became a member of the American Pharmaceutical Association in 1889. One son and a daughter survive the deceased.

GEORGE D. TIMMONS.

George Deming Timmons, descendant of a long line of Scotch-Irish ancestors, was born on August 10, 1867, in Warren County, Indiana. After receiving his early training in Green Hill Seminary, he taught in the public schools from 1884 to 1895. He married Mary Alice Sayers in 1888 and to them were born five children, four of whom are living. The mother of these children died in 1904. Mr. Timmons was married to Mrs. Cecilia Spurbek in 1905. They had one daughter.

GEORGE D. TIMMONS

Mr. Timmons entered Valparaiso University in 1895, was graduated with honors in the Pharmacy class of 1897, appointed assistant Professor of Chemistry and Pharmacy, from which position he was elected Head of the Department of Chemistry in 1909 and Dean of the Department of Pharmacy in 1912. During this time he attended the University

of Chicago, doing post-graduate work under Alexander Smith, with whom he continued a cordial relationship.

Under Mr. Timmons' leadership the School of Pharmacy became one of the most important and most completely organized and equipped departments of the University. His acquaintance with members of his profession, his activity to place the School of which he was Dean among the most efficient in the country, a constant and conscientious endeavor to be loyal to the best interests of the students, the University, the ethics of his chosen work, and the spirit of his subject, made of him a distinct personality.

Mr. Timmons published in 1914, "Experiments in General Chemistry I and II," and in 1917 "Qualitative Chemical Analysis." At the time of his death he was engaged in gathering data for a further publication.

An active member of the American Pharmaceutical Association and of the American Chemical Society, and for four terms a member of the Valparaiso City Council, he continually made himself felt as a factor in the life of his community and his profession.

Since May Mr. Timmons had been in the offices of the Eli Lilly Company of Indianapolis, filling a position made vacant by the draft. Following a week's illness with typhoid fever, he died July 18th, at the Methodist Hospital in Indianapolis. Services were held in the Auditorium of Valparaiso University at Valparaiso, interment being made in Grace-land Cemetery.

E. H. WISNER.

John Frederick Kutchbaugh, member of the A. Ph. A. for a number of years, and veteran druggist of Northside, Cincinnati, Ohio, died June 22, aged 62 years. Resolutions of sympathy were prepared by a committee composed of J. Fred Zuenkel, Charles T. P. Fennel, Theodore D. Wetterstroem, Louis Werner, Sr., and submitted by Secretary Charles A. Apmeyer, of the Cincinnati Branch, A. Ph. A. Mr. Kutchbaugh conducted a pharmacy at Blue Rock and Lake-man Streets for thirty years and was previously engaged in the drug business in Dayton, Ohio. He participated actively in association work and was a graduate of the Cincinnati College of Pharmacy. He is survived by a daughter and one son, who is in service in the Motor Truck Division.

SOCIETIES AND COLLEGES.

THE CHICAGO CONVENTION OF THE
AMERICAN PHARMACEUTICAL
ASSOCIATION.

This issue of the JOURNAL will reach the homes of the members during Convention Week, and it is to be hoped many will be in attendance as there is much important work that requires attention.

Whatever the attendance may be, the thanks of the Association are due the pharmaceutical publications for the splendid publicity given by them. While such expression will be given in resolutions we desire to take this opportunity of making such record of appreciation. Many who are usually in attendance will be absent and doubtless for good and sufficient reasons. All, however, have been impressed with the importance of the meeting.

FOURTH NATIONAL EXPOSITION OF
CHEMICAL INDUSTRIES.

The Fourth National Exposition of Chemical Industries will be held in the Grand Central Palace, New York, during the week of September 23. The coming Exposition will be the largest Chemical Exposition ever held and it will be necessary to use four floors of the Grand Central Palace. The amount of floor space already engaged is greater than last year so the managers say the exhibits will be much more attractive and a movement is under way to show all exhibits of machinery in operation under actual working conditions as they would be found in the field. The products of the chemicals manufactured and as they enter into the world's commerce will be there as examples of what the chemist has produced in America since the world war began.

SYLLABUS COMMITTEE.

BULLETIN XVIII.

The Committee will meet at the headquarters hotel during the meeting of the American Pharmaceutical Association in Chicago, in the week beginning August 12, 1918. The exact time and place will be announced by the Chairman and Secretary.

It is expected that the three sub-committees will submit the revision of their several sections of the present Syllabus for consideration and adoption by the whole committee, after any necessary changes are made.

The Chairman has been collecting suggestions and material for the proposed third year course and will present the results as a basis

for the preparation of this addition to the Syllabus.

The programme of the meeting will be as follows:

- I. Roll-call.
- II. Report of the Chairman.
- III. Report of the Secretary-Treasurer.
- IV. Report of the Sub-Committee on Materia Medica, H. H. Rusby, *Chairman*.
- V. Report of the Sub-Committee on Chemistry, J. A. Koch, *Chairman*.
- VI. Report of the Sub-Committee on Pharmacy, W. H. Rudder, *Chairman*.
- VII. Discussion of the proposed addition to the Syllabus, covering a third year of study, leading to the degree of Pharmaceutical Chemist.
- VIII. Miscellaneous business.
- IX. Adjournment.

Signed, THEODORE J. BRADLEY,
Chairman.

BOSTON, July 25, 1918.

THE ANNUAL CONVENTION OF THE
NATIONAL ASSOCIATION OF RETAIL
DRUGGISTS.

The appeals for attending the meetings of associations apply with equal force to that of the National Association of Retail Druggists. Never before in the history of the country have so many problems confronted the retail druggists and by conferring together benefit will accrue to all of them. We use the words of President W. H. Cousins:

"To-day, as never before, druggists should stand together in the unstinted support of their local, state and national organizations. Your craft and your country need you, and you can serve your country best through co-operating with your craft. Every industry in America feels the tightening tentacles of the monster war; every industry in America is making its sacrifices.

"Will any craft make sacrifices more readily or more willingly than the men trained in the science of pharmacy? We say 'No,' a thousand times no! This is no time for idle words. There is work to do that requires grim determination, backbone and hearts of oak.

"On behalf of the National Association of Retail Druggists, we urge every druggist in America to do not only his bit, but his best for the organizations whose missions in the world are for the betterment of the conditions of our calling—thus serving our government to the best possible advantage."

THE NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

The regular monthly meetings of the National Pharmaceutical Service Association held throughout the winter in Philadelphia expanded during the last month into many centers of activity where State associations were gathered. The Edmonds Bill, for which the N. P. S. A. is working hard, was again approved through strong resolutions at practically every State Association meeting held during the last six weeks. In many places petitions were signed and forwarded to the President of the United States, Secretary of War, and the Surgeon-General of the Army, and to Congress, and in Pennsylvania and New Jersey, similar petitions have been circulated to all members of the State Associations with the request that they secure signatures of the parents of the men in the service, of physicians, and other prominent men in the community, urging upon Congress the passage of suitable legislation for the establishment of a pharmaceutical corps.

One encouraging development has been the active advocacy of the Edmonds Bill by the *Pennsylvania Medical Journal*.¹ Everyone who is interested in this legislation should try to secure the support of physicians, the large majority of whom are entirely in harmony with the efforts of this association, knowing well the importance of pharmaceutical help and recognizing the need for the use of all resources of the country, which are available for helping the Medical Service. Another encouraging development has been the support given the Edmonds Bill by the Rotary Clubs of the country, not only in many local organizations, but at the recent Convention of the International Association of Rotary Clubs, resolutions were passed and forwarded to the officials at Washington, strongly urging the establishment of a pharmaceutical corps in the Army and Navy.

Those who are impressed with the importance of securing this kind of service for the men in the Army, can help by securing the interest of citizens, especially those who are not pharmacists, to prove the disinterested character of our claim. They should send letters and signed petitions, urging this legislation. Anyone who is willing to help in this way should correspond at once with the Secretary, E.

Fullerton Cook, 145 N. Tenth Street, Philadelphia, Pa.

When confronted with the question, "What can be the help of a Pharmaceutical Corps in the American Army?" let us point with pride and with hope to the splendid work being done to-day in France by the Marines and also in our Navy. Here the Chief Pharmacists, over 200 of whom have been advanced since the war began, to the rank of Junior Lieutenant, are doing the very work which we advocate for the Pharmaceutical Corps in the Army, and are doing it exceptionally well. This fact should answer conclusively the claim that the Army cannot use pharmacists. It is true these men have had special training in the needs of the service; they know how to take care of the medical stores, to look after the sanitation of the camp, to dispense needed medicines, and act as general superintendents for the hospitals, but this same training can be given to graduate pharmacists in the Army, and Navy. Doctors admit that graduate pharmacists respond to the training more quickly, and produce, as a class, a better type of men than any others who enlist.

THE NATIONAL WHOLESALE DRUG- GISTS' ASSOCIATION CHARGED WITH "CONSPIRACY" BY THE FEDERAL TRADE COMMISSION.

The Federal Trade Commission, on June 29, served complaint against the National Wholesale Druggists' Association, alleging that it has reason to believe, and charges on information and belief, that the respondents are, and for more than two years last past have been wrongfully and unlawfully engaged in a combination or conspiracy among themselves, with the intent, purpose and effect of discouraging, stifling and suppressing competition in interstate commerce in the wholesale drug trade of the United States.

The complaint further charges that the aforesaid combination and conspiracy to induce or compel manufacturers of drugs and druggists sundries, to refuse to sell them as such or to discriminate in price against them, have been effected and carried out by various means, among them the following: By verbal and written notices to manufacturers that certain customers or prospective customers were not entitled to recognition, as so-called regular or legitimate jobbers; by the appointment of committees to confer with said manufac-

¹ Also the *Missouri State Medical Journal*.—Editor.

turers or owners, for the purpose of influencing said manufacturers to adopt sales methods in harmony with the policies of the National Wholesale Druggists' Association; by written and verbal notices given by the secretary of the National Wholesale Druggists' Association to said manufacturers that said competitors who are not members of said association are selling below the net price named by manufacturers for resale; by the compilation and distribution among manufacturers and wholesalers of lists of so-called legitimate jobbers; by bringing influence to bear on various local associations of drug jobbers and wholesalers to adopt policies in harmony with the policies of the National Wholesale Druggists' Association.

The predominant issue seems to involve questions concerning resale prices and may bring about a definite understanding of the law on the subject. We concur with the *Paint, Oil and Drug Reporter* in saying:

"We do not believe—particularly in view of the character of the men named in the N. W. D. A. citation, and of the complete and self-sacrificing coöperation by this branch of the pharmaceutical industry with the Government in all war activities—that there has been any attempt on the part of the Association to evade any statute law of the United States."

SCHLOTTERBECK MEMORIAL PORTRAIT.

At the Fiftieth Anniversary of the Michigan University College of Pharmacy, the presentation of the Schlotterbeck Memorial Portrait was one of the features. Also at this time Dean A. B. Stevens was pleasantly surprised by the Alumni, who presented him with a fine engraved gold watch.

RECRUITING FOR Y. M. C. A.

Manufacturers and wholesalers in the New York drug trade have been asked to assist in the recruiting of the four thousand Y. M. C. A. workers requested by General Pershing to go to France and look after the needs of the American Army there. An informal committee of the drug industry, comprising Dr. Wm. J. Schieffelin, Sanders Norvell, F. E. Holliday, Henry S. Livingston and Franklin Black decided to make an appeal to those manufacturing and wholesale houses who have salesmen on the road, asking them to designate one of their travellers for the overseas work.

Travelling men are specified in this letter,

because of the intimate touch they acquire with human nature, as well as other qualifications which might be expected to fit them for the work. They are not particularly designated in General Pershing's request, and any man who can meet the mental, moral and physical requirements is desired.

STATE PHARMACEUTICAL ASSOCIATIONS.

OFFICERS FOR 1918-1919.

CONNECTICUT.

President, Carl S. Ramsey, New Britain (re-elected).

First Vice-President, Chas. T. Hull, New Haven.

Second Vice-President, Semion S. Nelson, Hartford.

Secretary-Treasurer, P. J. Garvin, Bethel (re-elected).

DELAWARE.

President, W. B. Jester, Delaware City.

Vice-Presidents, George W. Rhoades, Newark; Walter Keys, Smyrna; R. N. Kauffman, Seaford.

Treasurer, Oscar C. Draper, Wilmington.

Secretary, Nora V. Brendle, Wilmington.

Executive Committee, W. B. Jester, J. M. Tarvey, Erdman Hoffman, Harry Worrell and R. H. Leesome.

FLORIDA.

President, Marshall Rize, Tampa.

Vice-Presidents, J. S. Jewett, Lakeland, Roy N. Chelf, Brooksville, and T. H. Lander, Bradentown.

Secretary-Treasurer, J. H. Haughton, Palatka.

Executive Committee, W. D. Jones, Jacksonville; W. A. Rawls, Pensacola; M. M. Taylor, Tampa.

GEORGIA.

President, Dr. T. F. Burbank, Cedartown.

Vice-Presidents, W. T. Knight, Savannah; D. G. Wise, Atlanta; and R. E. Perry, Sylvia.

Secretary, T. A. Cheatham, Macon.

Treasurer, T. C. Marshall, Atlanta.

Tybee Island was chosen as the permanent meeting place.

IDAHO.

President, A. E. Sutton, Caldwell.

First Vice-President, Thomas Poole, Nampa.

Second Vice-President, Roscoe Smith, Boise.

Secretary, Norman C. Beckley, Boise.

Treasurer, C. W. Isenbun, Ashton.

IOWA.

President, T. M. Watts, Holstein.

Vice-Presidents, J. G. Becker, Dubuque; George Judisch, Ames; and P. W. Dowd, Guthrie Center.

Secretary, Al Falkenhainer, Algona; *Membership Secretary*, H. E. Eaton, Des Moines.

Treasurer, J. M. Lindly, Winfield.

INDIANA.

President, E. W. Stucky.

Vice-President, W. A. Oren.

Secretary, Wm. R. Werner (re-elected).

Treasurer, Frank H. Carter (re-elected).

One Executive Committeeman, B. M. Keene.

MAINE.

President, Frank H. Neal, Fairfield.

First Vice-President, E. F. Carswell, Gorham.

Second Vice-President, C. F. Cox, Bath.

Third Vice-President, S. I. White, Houlton.

Treasurer, A. W. Meserve, Kennebunk.

Secretary, Dr. M. D. Porter, Danforth.

MASSACHUSETTS.

President, Clifford P. Thompson, Springfield.

Vice-Presidents, Charles C. Hearn, Quincy; Alfred J. H. Paquette, Lynn; J. K. Mullarkey, Framingham.

Treasurer, James F. Finneran, Boston.

Secretary, James F. Guerin, Worcester.

MICHIGAN.

President, J. H. Webster, Detroit.

Vice-Presidents, Lee Chandler, Charlotte; and P. C. Brooks, Houghton.

Secretary, Frank J. Wheaton, Jackson.

Treasurer, Francis B. Drolet, of Kalamazoo.

Members of the Executive Committee, Geo. H. Grommet and E. W. Austin, Midland.

NEW JERSEY.

President, George M. Beringer, Jr., Camden.

First Vice-President, Louis L. Stachle, Newark.

Second Vice-President, Charles A. Bye, Lakewood.

Treasurer, Edgar R. Sparks, Burlington.

Secretary, Jeannot Hostmann, Hoboken.

Board of Trustees, Harry W. Crooks, Frank C. Eckert, E. T. N. Stein, Luke C. Hines and H. W. Holzhauser.

The next meeting will be held at Atlantic City in June 1919.

NEW YORK

President, Henry B. Smith, Brooklyn.

First Vice-President, Robert S. Lehman, New York.

Second Vice-President, O. B. Chapman, Richfield Springs.

Third Vice-President, Walter B. Tongue, Poughkeepsie.

Secretary, Edward S. Dawson, Syracuse.

Treasurer, Frank Richardson, Cambridge.

Executive Committee, Charles N. Lehman, Tottenville; Pineus Hertz, New York; and Herbert Wright, Syracuse.

PENNSYLVANIA.

President, Charles R. Rhodes, Hyndman.

First Vice-President, Ambrose Hunsberger, Philadelphia.

Second Vice-President, James F. Kane, Pittston.

Secretary, Robert P. Fischelis, Philadelphia.

Treasurer, Francis H. E. Gleim, Lebanon.

Assistant Secretary, Louis Saalbach, Pittsburgh.

Local Secretary, C. Lyston Jones, Easton.

Executive Committee, W. H. Knoepfel, for 3 years.

Next meeting Forest Park, Pa., 4th week of June 1919, unless Executive Committee makes other arrangements prior to January 1, 1919.

WEST VIRGINIA.

President, Roy B. Cook, Huntington.

First Vice-President, John W. Davis, Wheeling.

Second Vice-President, John A. Fitch, Charleston.

Secretary, P. H. Kelly, Thurmond.

Treasurer, G. H. Dent, Morgantown.

WISCONSIN.

President, A. F. Wussow, Milwaukee.

First Vice-President, C. B. Curran, Eau Claire.

Second Vice-President, A. F. B. Mentzel, Milwaukee.

Third Vice-President, L. Urheim, Eau Claire.

Secretary, Edw. G. Rauber, Milwaukee.

Treasurer, Henry Rollman, Chilton.

The 1919 convention will be held in Eau Claire, the last week in June.

UTAH.

President, John L. Boyden, Coalville.

First Vice-President, Frank J. Folland, Salt Lake City.

Second Vice-President, Chas. E. Driver, Ogden.

Treasurer, Geo. A. Huscher, Murray.

Secretary, Eugene L. Wade, Salt Lake City.

THE PHARMACIST AND THE LAW.

VENEREAL DISEASE ACT OF ONTARIO.

The Act for the Prevention of Venereal Diseases passed by the Ontario Legislature, came into force July 1. It provides that anyone publishing in a newspaper, magazine or other periodical, or posting up any statement or advertisement intended to recommend the purchase of any article, medicine, appliance, instrument or treatment for the alleviation or cure of venereal disease is liable to a fine of from \$100 to \$500.

It permits the filling of prescriptions, of regular medical practitioners, by pharmacists and the selling of patent or other proprietary medicines for the cure or alleviation of venereal diseases, provided that these remedies have been approved by the regulations of the Act.

The following remedies are approved by the Board named in the Act (Sec. 13) by the Legislature of Ontario:

For Gonorrhea: Silver, iodine, mercury, potassium, zinc, lead, and other mild astringents in their various forms. Essential oils, alkalies, balsams, and hexamethylene-tetramine.

For Syphilis: The arseno-benzol derivatives administered intravenously. Mercury in its various forms administered orally, intramuscularly and by inunction. The iodides, administered orally. The use of tonics, good food and life in the fresh air. The latter is essential to successful treatment.

For Chancroid: Carbolic acid, alcohol, silver salts, antiseptic dressings.

None of these remedies nor any other remedy, form of treatment, appliance, instrument or medicine, patent, proprietary or otherwise, shall be sold, offered for sale, recommended, suggested, advertised or promoted by anyone as a treatment for venereal or genito-urinary disease, unless such remedy,

medicine, treatment, appliance of instrument is prescribed by a legally qualified practitioner.

VENEREAL DISEASE REGULATIONS.

Regulations for adoption by State Boards of Health for the prevention of venereal disease have been suggested by the United States Public Health Service. They provide for registering all cases and quarantine if necessary for protection of public health. One section forbids druggists to prescribe treatment and reads as follows:

Rule 6.—Druggists forbidden to prescribe for venereal disease.—No druggist or other person not a physician licensed under the laws of the state shall prescribe or recommend to any person any drugs, medicines or other substances to be used for the cure or alleviation of gonorrhea, syphilis, or chancroid, or shall compound any drugs or medicines for said purpose from any written formula or order not written for the person for whom the drugs or medicines are compounded and not signed by a physician licensed under the laws of the state.

NARCOTIC NEWS.

Federal Judge Dickinson, Philadelphia, a few weeks ago sentenced seventeen drug peddlers. The sentences ranged from eighteen months to two years.

Several important arrests have recently been made in St. Louis and Baltimore. Morphine, cocaine and heroin, to the value of \$10,000, were seized by Federal officers in a raid upon the rooms of Frank Krissler, a confidential clerk in the employ of the Adams Express Co., who lived on Jefferson Street, Hoboken, N. J. The drugs were bottled and it is believed that they were stolen from shipments to the Army Medical Department.

BOOK NOTICES AND REVIEWS.

Pharmaceutical Botany. By Heber W. Youngken, Ph.G., A.M., M.S., Ph.D. Second Edition, Revised and Enlarged with 195 Illustrations. Publishers P. Blakiston's Son & Co. Philadelphia. Price, \$2.00, cloth.

The degrees earned by the author of "Pharmaceutical Botany" indicate his experience in pharmacy, and his studious application in pharmacy, pharmacognosy and botany is shown in the preparation of the

book. Thoroughness is evident and also a desire to communicate information relative to the subject that is necessary and will be serviceable for pharmacists. Extensive detailed studies of the structures of individual drugs have not been attempted, but more by giving a type; the book supplies knowledge of structural botany; the systematic arrangement is excellent and the text is characterized by succinctness and clearness in definitions

and descriptions. The volume has 386 pages which present essential information of pharmacognosy and botany that a pharmacist should have for an intelligent understanding of the official vegetable *materia medica*. The first edition of the book was prepared to meet the needs of students in pharmacy and in the revision and enlargement the same purpose has been kept in mind; while, therefore, especially adapted for students, pharmacists will find the book of interesting usefulness. Professor Youngken is professor of botany and pharmacognosy in the Philadelphia College of Pharmacy.

PUBLICATIONS RECEIVED.

The Pharmacist's Place, by J. U. Lloyd, reprint from *Eclectic Medical Journal*, 1887.

An American Crusade, a phase of the evolution of American Medicine and Pharmacy in the struggle against transplanted European cruelty, J. U. Lloyd. We reprint the concluding paragraph: "Lastly, while we accept that there is no man without the mote in his eye, may we not hope that one and all, regardless of medical politics, may realize that practicing physicians and educated pharmacists, not less than the leaders in both medicine and pharmacy, are allies in a progressive humanitarian cause; the differences of opinion are justified by distinctions in education, opportunities and location, but that all are alike working toward a common end—the uplift of humanity?"

Courses in Applied Science, an announcement of the Philadelphia College of Pharmacy.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGES OF ADDRESS SINCE MAY 28, 1918.

ALBERT ETHELBERT EBERT, PH.D.

CHICAGO, ILL.

1840-1906

President of the American Pharmaceutical Association, 1872-1873

ALBERT E. EBERT

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

SEPTEMBER, 1918

NO. 9

ALBERT ETHELBERT EBERT.

The meeting of the American Pharmaceutical Association in Chicago brought back to memory the lives of those who sojourned here and labored for pharmacy and the Association in the earlier years of its history. An interesting lecture on "Ebert, Oldberg and Hallberg" was delivered by Dr. H. M. Whelpley before the Historical Section in which he spoke of the characteristics of these pharmacists as they had impressed him during the many years of his association with them. The historical exhibit on this occasion was largely concerned with Mr. Ebert whose life is closely linked to the Association through his active participation in its affairs and his legacies. No attempt will be made to present a sketch of the deceased but only brief references to a few of his activities.

Mr. Ebert joined the American Pharmaceutical Association in 1864, was its third vice-president in 1868-1869; and president in 1872-1873. He was one of the delegates to the International Pharmaceutical Conference held at Paris in 1867 and to the British Pharmaceutical Conference the same year. He was a charter member of the Chicago Veteran Druggists' Association; a member of the Revision Committee of the U. S. Pharmacopoeia in 1870, vice-president of the Convention in 1900 and member of the board of trustees. He became connected with the Chicago College of Pharmacy in 1868 and was for a number of years professor of pharmacy in this institution. He graduated from the Philadelphia College of Pharmacy in 1864 and later received the honorary degree of master of pharmacy. In 1868 he received the degree of doctor of philosophy in the University of Munich.

By his will, most of the property he was possessed of was given to the American Pharmaceutical Association and this legacy, according to the last report of the treasurer, amounts to \$4,324.47. The Ebert Prize Fund was established by the deceased in 1873 and now has a value of \$1,133.27.

The last words spoken by Mr. Ebert were: "The American Pharmaceutical Association, it was my life; it gave me a profession."

Every man at time of Death,
Would fain set forth some saying that may live
After his death and better humankind;
For death gives life's last word a power to live,
And, like the stone-cut epitaph, remain
After the vanished voice, and speak to men.

—Tennyson.

EDITORIAL

E. G. EBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

THE SIXTY-SIXTH ANNUAL CONVENTION OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

THE valuable results of a convention are estimated from its accomplishments or the progress made in its laudable endeavors. The attendance at the Chicago meeting of the American Pharmaceutical Association was not as large as it would have been in normal times, but the registration records were very satisfactory and beyond the expectations of officials prior to convention dates. The accession of membership exceeded that of last report; 410 names were added during the year.

Throughout the proceedings the purpose to advance the opportunities of pharmacy was evident, and this determination found expression in the transactions of the affiliated bodies, of the Sections, the House of Delegates and the General Sessions of the Association.

Federation of the Drug Industries did not become an accomplished fact, but the movement has progressed by the expansion of the National Drug Trade Conference through the inclusion of delegates from the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties. Another step toward federation was taken by enlarging the functions of the House of Delegates of the A. Ph. A. and admitting representatives of State Pharmaceutical Associations to participate in its deliberations and promotions. Quoting from the report of the Federation Committee: "The National Drug Trade Conference and the House of Delegates will be as two piers of a great bridge, and when, as the years go on, there is completed between the two a connecting span in the shape of service features, so vitally needed in American Pharmacy, the federation will then be a realized dream."

The conclusions reached by the majority in attendance were that if a Pharmaceutical Corps is established in the U. S. Army only properly qualified pharmacists will be commissioned in that department. It was also recognized as essential that Congress and the public must be convinced of the significance of pharmaceutical service. In the present crisis coöperation with the Government in conservation is of paramount importance, and both the desire and ability to be helpful were clearly indicated in a number of the papers presented.

As a part of the program of the Scientific Section, Dr. H. H. Rusby delivered a lecture, illustrated by lantern slides, on "The Recognition at Sight of Poisonous and Medicinal Properties in Unknown Plants;" a series of papers dealt with the effect of the war on drug supplies, the manufacturing pharmacists, chemists, re-

tail pharmacists, etc., while others related to the development of materia medica. Instructive discussion in the Section on Practical Pharmacy and Dispensing added value to contributions on the conservation of alcohol, sugar and glycerin, all important items of the conservation list. In the Section on Commercial Interests, following the reading of a paper by Dr. A. R. L. Dohme, action was taken to provide for a Conservation Committee to which the Association signified its approval. Related work is now also engaging the Committee on Revision of the United States Pharmacopoeia and that of the National Formulary, all of which should convince the Surgeon General, the Medical Department of the Army, and Congress, that pharmacists have contributed, can, do and are willing to render service of the highest importance to the Medical Department, and that they are entitled to better recognition than has so far been accorded to them. The remarks made before the Association by Colonel Henry Raymond, representing the Medical Department of the U. S. Army, emphasized the necessity of furnishing convincing proof that pharmacists are in a position and qualified to render an indispensable service to the Medical Department,—he admitted that in the Army rank made greater efficiency and authority possible. It required no stretch of imagination to deduce that technicians and professional men should serve in the capacity for which they are qualified by training and education and should be given commissions commensurate with the service. Without unveiling his thoughts he commended the dentists for their past activities, and referred to their signal success in having a dental corps made part of the Medical Department of the U. S. Army.

The report of the Committee on the Status of Pharmacists in the Government service, printed in this issue of the JOURNAL, is of particular interest. The recommendations of F. H. Freericks, presented in a paper, that provisions be made now for looking after the welfare of pharmacists when they return from service abroad, received the hearty endorsement of the Association.

Provisions were made for a committee to devise ways and means for the creation of a loan fund for distressed pharmacists in the war zone.

Another subject—and this will be the final consideration of this writing—was presented in several papers and addresses, and related to the separation of pharmacies and drug stores. A committee was appointed to study the proposition, not only from the standpoint of practicability but of necessary legislation and applicable school curricula for both divisions. The thought is not new, and such distinction obtains in some European countries. It may not be altogether impracticable to make a division of this kind at this time, but as the convenience of the public enters into the move along with the inclinations of druggists and pharmacists considerable time will elapse before workable plans are stabilized for the decided changes that are involved. The general expressions on the

subject, however, indicate that there are some who would pursue exclusively the practice of pharmacy if those who are most interested in merchandizing would be willing to discontinue the pharmaceutical departments of their stores, and there are, doubtless, many druggists who would welcome the opportunity.

There was about a balance of arguments, pro and con, relative to the practicability of the proposition. The majority admitted that if it was possible to effect such a change pharmacy would acquire its professional standing and the druggists would attain a higher degree of proficiency and more general success in the business world. In other words, it was acknowledged that there was a degree of incompatibility under present conditions which interfered with the development of both pharmacy and the drug business.

The suggestion was made that because of the present status of the drug business recognition was not forthcoming to pharmacy by the establishment of a pharmaceutical corps in the U. S. Army. On this question the consensus of opinion was that there were many qualified American pharmacists, that their work conclusively proved this, and there was no expectancy of commissioned rank except for those pharmacists who could meet the requirements proposed in the Edmonds Bill.

Cicero said, "Certain signs precede certain events;" someone else has paraphrased this: "Great events have sent before them their announcements."

E. G. E.

PHARMACY IS AN "ESSENTIAL SPECIALTY" OF ARMY MEDICAL PRACTICE.

LET us be frank. The "lion in the pathway" of securing the establishment of a Pharmaceutical Corps in the U. S. Army is Surgeon General Gorgas, who has consistently and persistently opposed the movement for the establishment of the corps, the crux of his objection being that the practice of pharmacy in the Army is a non-essential specialty. (See Memorandum of War Department, February 13, 1918.)

There is, of course, a ready and complete answer to this. If pharmacy, which is a branch of therapeutics, is essential in civil life, it is equally essential in Army life. If the 150,000 physicians of the country require 50,000 retail pharmacists for civil medical practice, as they do, and if it is necessary for the 48 States of the Union to have pharmacy laws for the protection of the public against the serious dangers of incompetency in the compounding of drugs and poisons, as they have—surely the men of the Army deserve as skilled pharmaceutical service as they received at home, and this they do not get. There is no commissioned rank for pharmacists in the Army and no adequate pharmaceutical service.

We believe that the Surgeon General stands practically alone in his attitude. The American Medical Association, which stands for the medical profession of this country, has earnestly and enthusiastically urged the commissioning of pharmacists in the Army because "it would be but simple justice to the pharmacists themselves, because the usefulness of the Medical Corps will be greatly augmented, and lastly, and most important, because the efficiency of the Army demands it." And we are confident that if the matter of establishing a Pharmaceutical Corps in the Army was referred by vote to the men in the field there would not be the slightest doubt of its establishment.

The pharmacists of this country have repeatedly approached the Surgeon General on the subject of a Pharmaceutical Corps for the Army, but he is apparently adamant in his opposition. Why? "Is it because he is preëminently a sanitarian and not a therapist, and is more sympathetic to preventive medicine (of which sanitation is a branch) than to curative medicine (of which therapeutics and pharmacy are branches), as his establishment of a Sanitary Corps in the Army, while opposing the establishment of a Pharmaceutical Corps, might imply?" "Or is it"—and we believe this—"because he does not know and can not visualize the possibilities of an adequate and properly systematized pharmaceutical service in the Army?"

Possibly, also, he fears that if a Pharmaceutical Corps were established the Medical Department would be swamped by a large number of inadequately trained pharmacists when only a relatively small number of highly trained men would be needed.

But these objections are minor. The big, vital question is: "*Are trained pharmacists essential for the better protection of the health and lives of the men in the service?*" and there can be no doubt on this question in the light of the experience of our allied armies abroad with their pharmaceutical corps and the wonderful work the latter have done.

We believe that Surgeon General Gorgas—for whom we have the highest respect as a scientist and as a man—is honest and sincere in his opposition to a Pharmaceutical Corps, but he has been ill-advised, *looking towards the future needs of the Army*. The pharmacists of this country do not want a Pharmaceutical Corps *as pharmacists*, but as American citizens, and because they know that American Pharmacy can be made most helpful to the Medical Department.

The Military Surgeon (August 1918, 207) estimates editorially that there are 115,500 physicians in the United States available for all purposes, being 80,000 under 50 years of age; and states that "we are probably not suffering this moment from lack of medical officers, as there are 25,000 of us, but, should volunteers fail, we soon would be in dire need of them to supply our rapidly increasing forces." The ratio of medical men in the regular Army has been 7 to 1,000 of

military population. This war is more destructive of medical men than any previous war, and if prolonged will require 15 per 1,000. (In the British Army the ratio is now 19 per 1,000) or 75,000 for five million troops or, practically, all the active medical men of the country!

In the light of these facts it seems to us that the Surgeon General could exhibit no greater prescience than to conserve the medical forces of the country by utilizing properly trained pharmacists as medical assistants in first aid, as laboratory technicians, and in releasing medical men from non-medical duties, as well as in technical pharmaceutical work.

As Torald Sollmann (*Journal A. M. A.*, August 10, 1918) so well says, in his article on "Pharmacology in the War"—"It is the problem of the war for a country to meet and to defeat not only the human enemy, but the forces of nature. Severe necessity arises in many forms, in many new garbs. That, however, brings out one of the compensations of the war. *Necessity is the mother of invention, of conservation, of efficiency. The happy-go-lucky ways of peace no longer suffice. Every form of human endeavor is forced to the supreme effort.*"

American Pharmacy stands ready to make the supreme sacrifice, if needs be. Why ignore it?

J. W. ENGLAND.

AMENDMENT TO REGULATIONS, UNITED STATES PUBLIC HEALTH SERVICE.

No. 4.

TREASURY DEPARTMENT,
BUREAU OF THE PUBLIC HEALTH SERVICE,

Washington, July 16, 1918.

To Commissioned Officers, Acting Assistant Surgeons, Pharmacists, and Others concerned:

Paragraph 87, Regulations of the United States Public Health Service, approved March 4, 1913, as amended June 19, 1914, is hereby amended to read as follows:

Par. 87, Pharmacists, when on duty at United States marine hospitals or quarantine stations, shall, when practicable, be entitled to quarters, necessary household furniture for same, subsistence (as allowed previous to Mar. 4, 1913), fuel, light, and necessary laundry work, and when on duty at stations where there are no quarters belonging to the service, they shall be entitled to commutation therefore at the rate of \$40 a month for quarters, fuel, and light, and \$60 a month for subsistence and all other allowances.

RUPERT BLUE,
Surgeon General.

Approved:

L. S. ROWE,
Acting Secretary of the Treasury.

Approved

WOODROW WILSON,
The White House.

THE ANALYSIS OF LIQUID AND AROMATIC EXTRACTS OF CASCARA SAGRADA, AND THE INTRODUCTION OF A MANGANESE NUMBER FOR THE SAME.*

BY L. E. WESTMAN AND R. M. ROWAT.

Much work¹ has been carried out in connection with the examination of *Rhamnus purshiana* bark (cascara sagrada) from the viewpoint of establishing its various constituents and their chemical nature. For the analyst who is called upon to examine extracts of this drug there is no very definite data or procedure available and the relative meaning of constants obtained is not easily judged from results so far published. When it is considered that anywhere from 500 to 2,000 tons of this bark comes upon the American market annually, it would seem that more than odd partial analyses of extracts and trade preparations made from it would be of some value. Having the opportunity to work on a very large number of different samples, we have attempted to supply some general averages for constants observed from commercial samples just as they are found on the market. The most important objective was, however, to devise a means of estimating quantitatively the amount of actual cascara extractive present. Within limits this has been done by the development of a manganese number for these extracts.

Tichborne² reports the examination of some 29 samples of liquid extract of cascara sagrada. He found that liquid extracts of this drug when prepared according to B. P. methods yielded 24 to 25% solids. The drying and non-drying properties of these preparations were examined. The non-drying samples were found to contain glycerin, and excessive reduction with Fehling's solution was taken as an indication of adulteration of the sample. Mort and Rotlie³ reports the analysis of a single sample of cascara. The tests they make are in no respect very distinctive.

Before approaching work of this kind a comparative knowledge of the requirements of the various pharmacopoeias is essential as a constant guide. This information is outlined below for the reason that there seems to exist sufficient differences in methods of percolation to give rise to a wider range of values for certain determinations than is generally taken into account.

In the British Pharmacopoeia⁴ and Codex, Cascara Sagrada is defined to be "The dried bark of *Rhamnus purshiana* D. C. and collected at least one year before being used." The official liquid preparations as defined in this edition are: (1) Liquid Extract of Cascara Sagrada containing the extract from 100 Gm. of No. 20 powder made up to 1000 Cc. with distilled water and 250 Cc. of 90% alcohol. Instructions are given to exhaust the bark with distilled water by the percolation process. This reads as follows:¹

"Moisten the solid materials with the prescribed quantity of menstruum, set aside for four hours in a well closed vessel, pack in a percolator and add sufficient of the menstruum to saturate the materials and leave a layer of liquid above. Macerate for 24 hours. Then allow percolation to proceed slowly until the percolate measures about three-fourths of the volume required for the

* Published with the permission of the Minister of Inland Revenue, Canada.

finished tincture. Press the marc, mix the expressed liquid with the percolate and add sufficient of the menstruum to produce the required volume. Clarify by subsidence or filtration if necessary."

Following this the percolate is evaporated to 600 Cc. and the alcohol, previously mixed with sufficient distilled water to produce the required volume, is added.²⁶ An aromatic Syrup of Cascara, containing liquid extract of cascara, tincture of orange, alcohol, cinnamon water, and syrup is also an official preparation. This syrup is a solution of sucrose and water of a Sp. Gr. of about 1.330. The B. P. Codex 1911 mentions⁴ 17 extracts and compounds in which cascara may be employed. Four of these are compound tablets or pills. The rest are liquid, fluid, or aromatic extracts or mixtures. They may contain, in general, any combination of harmless aromatic oils, tinctures, licorice, glycerin, alcohol, alkalies, ammonia, or chloroform water. In order to destroy the natural bitter taste of the cascara, lime, magnesia, potassium hydroxide, ammonia, sodium and ammonium salts, and zinc oxide⁸ have been used during percolation. Chloroform water is added to prevent active fermentation, while the use of alkalies follows from the incompatibility of extracts of cascara with acids or strong solutions of mineral salts.

Three official preparations are mentioned in the United States Pharmacopoeia. They are the extract⁹, the fluidextract,¹⁰ the aromatic fluidextract.¹¹ The fluidextract contains a gramme equivalent of the bark per Cc. as well as 250 Cc. of alcohol in every 1000 Cc. of standard extract. No. 40 powder is used and the method of percolation is as follows:¹²

"To 1000 Gm. of the dried drug add 5000 Cc. of boiling water, mix thoroughly and allow it to macerate in a covered container in a warm place for two hours. Then transfer the moist drug to a tinned or enamelled percolator and allow percolation to proceed, gradually adding boiling water until the drug is exhausted. Evaporate the percolate on a water bath to the volume specified and when cold add the alcohol directed and mix thoroughly."

The official aromatic fluidextract of cascara in U. S. P. is a product debittered by magnesium oxide and contains glycerin, licorice and alcohol along with small amounts of benzolsulphinide, methyl salicylate, oil of cinnamon, oil of anise, and oil of coriander.

In evaluating relatively a large number of preparations the following data grouped under various headings has been derived. We have divided the samples into two classes, as follows:

Class (1). Aromatic extracts of cascara sagrada and unofficial trade preparations containing licorice, glycerin and aromatics.

Class (2). Samples deemed to be genuine fluid extracts of cascara sagrada.

SPECIFIC GRAVITY.

By this determination alone a close line may be drawn between those samples which are likely to prove to be aromatic and those likely to be found to be liquid or fluid extracts of cascara. Determinations were made directly at room temperature (20° C.) by means of a set of hydrometers. Finer work than this does not yield correspondingly more valuable results. The following table¹³ deals with 136 samples, which are divided into two classes as defined above:

TABLE I.

| Class (1). Range of sp. gr. | No. of samples in range. |
|--------------------------------|--------------------------|
| 1.000 to 1.100..... | 5 |
| 1.100 to 1.200..... | 22 |
| 1.200 to 1.300..... | 9 |
| 1.300 to 1.400..... | 1 |
| | — |
| | 37 |
| Class (2). | |
| Below 1.030..... | None |
| 1.030 to 1.040..... | 1 |
| 1.040 to 1.050..... | 3 |
| 1.050 to 1.060..... | 14 |
| 1.060 to 1.070..... | 33 |
| 1.070 to 1.080..... | 40 |
| 1.080 to 1.090..... | 4 |
| 1.090 to 1.100..... | 4 |
| | — |
| | 99 |

Squire's Companion to the B. P.¹⁴ gives the Sp. Gr. of liquid extracts of cascara sagrada as 1.06. It would appear from our work that a suitable range would be from 1.05 to 1.08. Working by the method quoted above for B. P. percolation, we obtained on two trials, values of 1.058 and 1.057, as the Sp. Gr. of the finished extract. By the U. S. P. method, working on the same bark we obtained 1.078 and 1.079 as the Sp. Gr. of the extract thus prepared. It is thus necessary to recognize a large range in order to include all the possibly genuine samples. Preparations below this range could, by other determinations, be shown to be diluted extracts, while samples above this range invariably contain more solids than is normally possible to extract by any official method of percolation.

No such limits of Sp. Gr. as have been prescribed for fluid extracts of cascara sagrada can be laid down for preparations of the order of class (1). The Sp. Gr. of aromatic syrups of cascara B. P. and of aromatic fluidextract of cascara sagrada U. S. P. calculated from pharmacopoeal requirements, should be 1.17 and 1.18, respectively, and in class (1) 18 samples very closely approach these figures, yet from the Sp. Gr. alone it would be rash to infer that any given sample were one or the other of these official preparations. Indeed the majority of the samples in class (1) are not official, although the greater number show Sp. Grs. which are approximately those of the official aromatic preparations.

ALCOHOL.

The alcohol content V/V of the various official liquid preparations of cascara sagrada may be readily shown by reference to the requirements of the various pharmacopoeias to be approximately as follows:

| Name of extract. | Alcohol V/V %. |
|-------------------------------------------|----------------|
| Fluid Extract Cascara Sagrada B. P..... | 22.5 |
| Aromatic Syr. Cascara Sagrada B. P..... | 13.5 |
| Fluidextract Cascara Sagrada U. S. P..... | 24.0 |
| Aromatic Cascara Sagrada U. S. P..... | 24.0 |

From an inspection of the above figures, and from consideration of the alco-

The problem of relatively evaluating a fluid extract on the basis of its total solids is more complicated than would appear at first sight. Squire would allow a range of from 17 to 27%.¹ Reasonable commercial practice and theoretical possibilities conflict on this point. The chief causes of this variation are: (1) In the hands of different operators results obtained by the same official method of percolation may differ. (2) The Official U. S. P. and B. P. methods of percolation themselves differ and yield correspondingly different results in extracting the same drug.

We extracted two 50 Gm. samples of genuine cascara bark by the B. P. method of percolation and obtained two liquid extracts yielding 21.79 and 21.03% of total solids. Working on equal amounts of the same bark, but following the official method of U. S. P. percolation, we obtained extracts yielding 30.50 and 31.48% of total solids. This difference may be traced directly to the variation of pharmacopoeial directions. The U. S. P. requires the drug to be exhausted with boiling water, and the percolate, to be evaporated to a definite volume. Neither the amount of boiling water to be used nor the size of the portions are specified. We found the volume of water necessary to completely exhaust the cascara bark to be exceedingly large compared with the volume to which the percolate must subsequently be evaporated. To completely exhaust 50 Gm. bark 2000 Cc. of boiling water in 75 Cc. portions were required, and this had to be evaporated to 37.5 Cc. Such a rigorous extraction, although theoretically official, would be very impractical commercially. At the same time it may be pointed out that extracts of cascara sagrada containing a greater proportion of total solids than Squire would allow may very readily be prepared by following official methods of percolation.

A well-known firm of manufacturing pharmacists in a private communication supplied us with data relative to the possibility of obtaining a uniform extract from cascara bark. Out of 24 lots of this drug, working on a commercial basis, the extractive never fell below 18.8% and exceeded 22% in only one instance. On this particular lot the extractive measured 26.6%. They were using the official U. S. P. method of percolation. It seems evident then that the official methods may be translated into a number of uniform procedures which may differ in results over a wide range according as the detail varies. All these considerations must be taken into account before passing an opinion on any sample based on a determination of its total solids.

SOLIDS PRECIPITATED ON DILUTION WITH WATER.

On dilution with water an aromatic extract of cascara sagrada which contains licorice or glycerin in pharmacopoeial proportions will retain all its solids in solution. On the other hand, a liquid extract of cascara whose solids are held in solution by virtue of its alcohol content will, when diluted, give a measurable precipitation, when the alcohol content drops below 10.0%. Our determination of this value was made by dropping 5 Cc. of extract into 95 Cc. of water and filtering off on a tared filter.

We tested 75 samples in this manner with the following results:

TABLE IV.

| Class (1). Range of solids precipitated on dilution | Number of samples in range. |
|-----------------------------------------------------------|----------------------------------------|
| None..... | 20 |
| 1.0 to 2.0%..... | 2 |
| | — |
| | 22 |
| Class (2). | |
| None..... | 1 (this sample contained only 3% alco- |
| 0.5 to 1.0%..... | 5 hol and no precipitation was to be |
| 1.0 to 2.0..... | 24 expected.) |
| 2.0 to 3.0..... | 17 |
| 3.0 to 4.0..... | 4 |
| 4.0 to 4.5..... | 2 |
| | — |
| | 53 |

It is more than probable that any sample of Class 2 that is found to give less than 1.5% solids on dilution by this method will be found to be a diluted extract, from alcohol or other determinations.

REDUCING SUGARS.

We adopted the practice of taking up to a definite volume the filtrate from the determination of solids on dilution and determining the reducing sugars in an aliquot thereof by means of Fehling's solution. In our results sugars are reported as glucose. There is evidently a normal content of such sugars for genuine fluid extracts of cascara sagrada, which varies within quite narrow limits from 5 to 7.5%. Aromatic extracts are always much lower than this and run from 1 to 3%.

TABLE V.

| Class (1). | | Class (2). | |
|----------------------------------------------------|--------------------|----------------------------------------------------|--------------------|
| Range of reducing sugars calculated as glucose. | No. of samples. | Range of reducing sugars calculated as glucose. | No. of samples. |
| 0.0 to 5%..... | 16 | 4.0 to 5.0%..... | 9 |
| 5.0 to 10.0..... | 7 | 5.0 to 8.0..... | 33 |
| | — | 8.0 to 10.0..... | 12 |
| | 23 | | — |
| | | | 54 |

All genuine aromatic extracts in Class 1 come in the group from 0.0 to 5.0%. Samples above this range in this class are nondescript trade preparations. All samples in Class (2) running above 7% gave abnormally high total solids.

LICORICE, GLYCERIN AND AROMATICS.

These substances are used to disguise the bitter taste of the cascara. No quantitative work was attempted save in the case of glycerin and even in this case an exact determination presents considerable difficulty. An approximation was arrived at by the method of boiling off the glycerin in steam. Ten Cc. of the aromatic extract were slowly heated to 160° C. and by the addition of small quantities of water from time to time, the glycerin was boiled off. The difference in weight between the solids remaining at this temperature and those remaining after drying at 110° C. was considered to represent the glycerin. A certain increase in weight occurs owing to the slow oxidation of cascara solids at 160° C. and it is also possible that some glycerin may become non-volatile during the

process. The sum total of these errors as determined through such suitable blanks as could be devised is not sufficient to destroy the usefulness of the method. The former is the greater of the two errors and may account to a 2% increase of the total solids present after 8 hours at 160° C. By subjecting a mixture of pure glycerin and cascara extract to this treatment it was found that practically all the glycerin could be driven off. It may be calculated that there should be about 25% of glycerin W/V present in U. S. P. aromatic extract of cascara sagrada. Out of 17 samples examined 8 contained less than this amount. The exposure of a few drops of cascara extract on a porcelain plate¹⁶ serves as a very simple and useful test of the nature of any cascara extract. A genuine liquid extract will dry up in a short time to a hard glassy varnish; an extract containing licorice or glycerin will not dry up even after long exposure over days and weeks, while an extract which has been so diluted as to lose the solids held in solution by virtue of its alcohol forms a sticky semi-crystalline mass which does not lose its stickiness for some days. All aromatic extracts examined were found to be non-drying, owing to their licorice and glycerin content.

ASH.

The value of an ash determination becomes evident from a consideration of its variation. If some attempt has been made to debitter the extract by application of lime, or application of the ordinary alkaline debitterants it is quite possible that through contamination or solution these might greatly increase the amount of ash. We found this to be the case. The color of the ash when heated strongly in a muffle is also a good indication of the nature of the sample. The ash from an aromatic extract containing licorice and glycerin will be greyish white; that from samples containing excess of lime salts will be pure white, while the ash of a genuine extract will be some shade of green, depending upon the amount of manganites present. This manganese comes from the bark and is sufficiently soluble in water to be found in this way in the ash. The calcium in the ash is not a constituent which might result from solution of the calcium salts of the bark during percolation. These salts are not removed to any extent by boiling the bark in water but are evidently present in the plant as oxalates and carbonates. From an inspection of the following table it will be seen that samples in Class (1) give ash values of a very wide range. In Class (2), however, the variation would seem to be within more reasonable limits.

TABLE VI.

| Class (1). | | Class (2). | |
|-----------------|-----------------|-----------------|-----------------|
| Range of ash. | No. of samples. | Range of ash. | No. of samples. |
| Below 1%..... | 1 | Below 0.5%..... | 1 |
| 1.0 to 1.5..... | 1 | 0.5 to 1.0..... | 33 |
| 1.5 to 2.0..... | 2 | 1.0 to 1.5..... | 18 |
| 2.0 to 2.5..... | 3 | 1.5 to 2.0..... | 5 |
| 2.5 to 3.0..... | 0 | 2.0 to 2.5..... | 1 |
| 3.0 to 3.5..... | 1 | Above 2.5..... | 1 |
| 3.5 to 4.0..... | 8 | | — |
| 4.0 to 5.0..... | 1 | | 59 |
| 5.0 to 5.5..... | 2 | | |
| — | — | | |

It would seem from our work that a range of 0.75 to 1.1% for the ash of genuine fluid extracts of cascara would not be unjust. Any extracts yielding ash above or below these limits were found to be abnormal in some other respect.

COLOR REACTIONS AND TESTS.

Hubbard¹⁷ reviews the generally known color reactions for the emodin-bearing drugs and we shall not attempt to do more than supplement this work. The presence of emodin (trihydroxymethylanthraquinone) is characteristic of rhubarb, aloes, senna, and cascara. These substances, from their properties, may be found at any time in admixture. The Bornträger¹⁸ reaction is the most convenient means of testing for this class of drugs. The well washed benzol extract of a few Cc. of the acidulated sample is made alkaline. In the presence of emodin a deep red color will appear in the water layer.

Cascara extract will give this test in greater dilution than any other common emodin-bearing drug while senna may fail to respond easily to the test. It must always be remembered that phenolphthalein may also be present. It may be removed by the method of Warren.¹⁹ There is a difference between the colors given by emodin alone and by phenolphthalein alone, in alkaline solution, that is easily distinguished by the eye. The emodin color is a deep red and more like methyl orange in acid solution, while the color from phenolphthalein is a deep pink. In admixture the color is quite distinct from either individual colors, when observed through thin sections of solution. Moreover, the phenolphthalein color fades when the solution is made strongly alkaline and allowed to stand for some time.

Phenolphthalein may also be detected in the presence of emodin by the following procedure: By a careful adjustment of the reaction of the solutions the Bornträger reaction may be modified in such a way as to give a separation of emodin from phenolphthalein. Extract 2 to 3 Cc. of the acidulated cascara extract with 25 Cc. benzol. Wash the benzol several times with water in a separating funnel and make alkaline with a dilute soda solution of known concentration and note approximately the amount used. Both phenolphthalein and emodin will now pass into the water layer. Neutralize this soda solution with dilute sulphuric acid of corresponding strength until two or three drops would suffice to destroy all the red color, shaking well during this operation. Wash the benzol again two or three times with water. The benzol will now contain no appreciable amount of emodin but if phenolphthalein was present some will still remain in the benzol layer, and will now give a pinkish red color to a further alkaline wash of the benzol; in the presence of phenolphthalein this alkaline wash will remain practically colorless. Differences between the solubility of phenolphthalein and emodin under these conditions coupled with the fact that emodin would seem to be a stronger acid than phenolphthalein probably accounts for this reasonably close separation. This method lends itself to fairly rapid work.

In attempting to carry out a Bornträger test for emodin, the operator must always have in mind the possibility that alkalis have been used to debitter any given extract. Many extracts of cascara will give a distinct red emodin test on simple dilution with water. Extracts which have been treated with alkalis and which yield a high ash are frequently so strongly basic that relatively quite large

amounts of acid must be added before a positive Bornträger reaction may be obtained.

All color reactions, when alkaline salts are used as a basis and where the formation of rings of different shades was depended upon to indicate the presence of emodin-bearing drugs other than cascara, were found to be untrustworthy. When the ether extract of any of the emodin-bearing drugs is poured into a solution of an alkaline salt a reddish ring will be formed at the junction of the two layers. This is really a miniature Bornträger reaction. The colors produced in these tests depend more on the concentration of emodin and chrysophanic acid in the ether layer than on any other single factor. The depth of color produced by equivalent amounts of ether extract of cascara, aloes, rhubarb and senna with solutions of borax, sodium hydrate, ammonium hydrate, sodium carbonate, sodium silicate, or any solution of salts alkaline by hydrolysis, were found to range from strong to weak in the order in which the drugs are named. The ether extract of a cascara never failed to give a decided red ring with these alkaline solutions and that of senna with equal regularity gave a much fainter red ring. It is to be noted that a ring such as was given by senna could be obtained by the action of a very dilute ether extract of cascara on these alkaline solutions. The ether extract of a pure infusion of rhubarb will give a blue color when brought in contact with a solution of ferrous sulphate.²⁰ This may be due to the presence of tannic acid. When one tries to follow this reaction in the presence of 50% cascara extract the detection of the rhubarb becomes almost impossible for the reason that, although cascara does not give the same coloration as rhubarb, it does give a color change sufficiently dense to obscure the rhubarb reaction. It is quite safe to say that small percentages of emodin-bearing drugs are much more likely to be missed than they are to be positively identified when present in unknown admixture in cascara. Senna is more commonly used in admixture with cascara than any of the others and is most difficult to detect. The ether extract of senna is said to impart a yellow to brownish coloration to ammonium thiocyanate or ammonium molybdate solutions.²¹ We were unable to obtain either reaction and in each case observed no color change. The absolute detection of aloes has been better worked out than that of any of the other emodin-bearing drugs. Mossler²² claims the ability to detect 0.2 Gm. of aloes in 5 Gm. of rhubarb or cascara. The fluorescence test²³ for aloes using borax solution with the ether extract, is certainly not sufficiently delicate to be of any value as a test for aloes in the presence of much cascara. Most of the samples of aromatic cascara and a large percentage of the trade preparations which we examined yielded a relatively faint test for emodin indicating a very low content of cascara extractive. It is worthy of note also that these same samples gave us unusually low manganese numbers.

MANGANESE NUMBER.

It has been pointed out in a previous article by us²⁴ that the bark of *Rhamnus purshiana* contains a relatively large quantity of manganese which is soluble by the method of percolation. The general usefulness of this determination depends on the fact that the manganese content of this bark is greatly in excess of that of other laxative drugs. It is exceeded by *Rhamnus frangula*, but this bark, by reason of its higher cost and the fact that it is imported is not likely to be used to replace

cascara sagrada. In liquid extracts then where cascara is the only drug extractive present a determination of the manganese content of the ash becomes a quantitative measure of the amount of cascara extractive present. Before trusting such data it is necessary to show that the manganese content of cascara is fairly uniform, or at least to define its limits. On an air-dry basis it has been found that the lower limit is around 0.0093% and the upper limit 0.015%. For the purpose of this work where the manganese is used as a standard the lower limit is the more important and it is safe to say that the greater part of the bark on the market will reach this standard. It is also necessary to show that the methods of percolation extracts this manganese in a uniform manner. It has been shown that for a definite method of percolation the manganese is extracted in proportion to its total amount in the bark.²⁵ For a certain bark it was found that the B. P. method of extracting gave 0.0023% manganese extracted and the U. S. P. gave 0.0028% manganese.

This was due to the fact that in our application of the latter method we used so much water and washed so often that the unusually high value of 30% was obtained for the solids extracted. It is thus possible to establish the minimum amount of manganese that should be present provided genuine cascara bark has been used and no dilution of the extract has taken place. For a liquid extract one Cc. is the equivalent of one Gm. of the bark. The percentage of manganese W/V in the extract is in direct proportion to the amount of cascara solids present. Therefore this percent is a direct measure of the bark equivalent of the extract. With this as a basis we have developed a manganese number for these extracts. We have defined this to be the percent of manganese $W/V \times 100,000$. Our lower limit then would come at 230 for samples prepared from air-dry bark. The amount of manganese will be proportional to the solids extracted; that is, the percent of manganese in the total solids of genuine extracts of cascara should be an approximate constant. Considering all our results where extraction may not have been uniform, we may say that this number varies from 0.01 to 0.02 for all samples found genuine. If the number falls below this limit it is evident that the solids of this extract are not all cascara solids. This manganese test is of particular value in distinguishing *Rhamnus purshiana* and *Rhamnus californica*. The latter contains only about one-third the manganese of the former and yields an extract with a manganese number of about 80. Whether or not some of the extracts examined which show low manganese numbers have been prepared from this bark is a matter of inference. The manganese content of licorice root²⁶ and its extract is sufficiently low not to interfere with the application of this method to aromatic extracts. The presence of no other common laxative drugs destroys to any extent the value of this manganese number. If, on the other hand, these drugs displace cascara, the manganese content will be very much lowered. It is safe to say when considering aromatic extracts that their manganese content varies directly with their cascara content. The method of estimation is that given elsewhere by us,²⁷ except that in the case of liquids, 10 Cc. were taken as a sample, being the equivalent of 10 Gm. of the bark when properly prepared. From the ash of this amount the manganese was determined by the ammonium persulphate method with silver salt as catalyzer. 76 samples are tabulated as follows:

TABLE VII.

| Class (1). | | Class (2). | |
|---------------------|-----------------|---------------------|-----------------|
| Range of manganese. | No. of samples. | Range of manganese. | No. of samples. |
| 0 to 50..... | 8 | 0 to 100..... | 0 |
| 50 to 100..... | 2 | 100 to 150..... | 6 |
| 100 to 150..... | 1 | 150 to 200..... | 6 |
| 150 to 200..... | 5 | 200 to 250..... | 7 |
| 200 to 250..... | 1 | 250 to 300..... | 10 |
| 250 to 450..... | 2 | 300 to 350..... | 6 |
| 450 to 600..... | 2 | 350 to 400..... | 3 |
| 600 to 700..... | 2 | 400 to 500..... | 13 |
| | — | 500 to 600..... | 1 |
| | 23 | 700 to 800..... | 1 |
| | | | — |

53

In conclusion, our thanks are due to Dr. J. M. Francis, of the Parke, Davis Co., Detroit, Mich., who kindly supplied us with genuine samples of these barks and practical information of value.

SUMMARY.

(1) Complete data relative to the analysis of 76 samples of extracts of cascara has been given.

(2) It has been shown that methods of percolation are not sufficiently detailed in various pharmacopoeias to allow general uniformity in trade preparations.

(3) A fairly rapid and reasonably conclusive test for the presence of phenolphthalein in emodin-bearing drugs is proposed.

(4) The introduction of a Manganese Number for cascara extract is proposed as a method for determining the amount of cascara extractive present, and as a basis of judgment on the nature of the extract.

THE RECOGNITION AT SIGHT OF POISONOUS AND MEDICINAL PROPERTIES IN UNKNOWN PLANTS.*

BY H. H. RUSBY, M.D.

The following paper is based on three simple facts:

1. There are certain groups of plants whose members are so uniform in medicinal or poisonous properties, or both, that the mere recognition of a plant as belonging to one of them is sufficient to indicate its general medicinal usefulness or its dangerous nature.

2. Associated with these physiological relationships are genetic relationships which are clearly indicated by the structural characteristics.

3. These structural characteristics are so manifest that the physician or pharmacist who possesses a fair practical knowledge of structural botany can at once recognize them, and thus be enabled, in cases of emergency, to utilize the plant medicinally or to avoid it if poisonous, in the absence of other knowledge concerning it.

Centuries ago, before the relationships among plants were understood, and when there was a complete absence of knowledge concerning the nature of medicinal action, mankind believed in divine revelation regarding medicinal treatment, which was supposed to be afforded only to the priesthood, who based thereon their claims to service as physicians. Later, a belief developed that this revelation had been made to all mankind, through the impression upon each medicinal plant of some visible sign of the nature of its medicinal action. This idea persists to some extent to the present day. One of my earliest recollections was that of being taken out by a neighbor, descendant of an old family of Dutch settlers, who explained to me the theory of signatures. "You will find," said he, "if you hunt close enough, that every plant has a sign somewhere that shows what part of the body it is good for." We pharmacists see this belief perpetuated in the common names of many of our drugs, as the blood root, the liver leaf, Solomon's seal, golden seal, lungwort moss, snake root and Devil's bit.

There have been various other so-called methods by which one was supposed to be able to judge the physiological properties of plants. A quarter of a century ago, a story went the rounds of the public press to the effect that the peculiar lurid-purple color that we observe upon the stem of the castor-oil plant, the pokeberry and the angelica, was always indicative of medicinal or poisonous properties, or both. I remember another to the effect that finely divided leaves, as seen

* A lecture, illustrated by lantern slides, before the Chicago Convention, A. Ph. A., 1918. Contributed to Scientific Section.

in conium and ragweed, possessed the same significance. Probably all here present are familiar with the story that has several times circulated in American newspapers, and doubtless will do so again, that poisonous fungi can always be known by their turning a silver spoon black when used for stirring them in cooking.

Science has taught all who are willing to learn that there are no such easy roads to reliable knowledge regarding plant properties. Judgment in this direction must depend upon accurate detailed information, studiously acquired. Nevertheless, it is possible for us, through the assembling and comparison of a great number of data, to reach certain generalizations that may be of value in cases of emergency.

It is my belief, based on many years of personal experience, that attention to the following illustrations, with their accompanying description, may be of great service to those who may find themselves separated from their base of supplies and dependent for drugs upon their utilization of the resources of the fields and forests about them.

A good illustration of my subject is found in

THE PIPERACEAE OR PEPPER FAMILY.

This small family, comprising only some eight or ten genera, even if we include the Lizard-Tail Family or *Saururaceae*, is exceedingly uniform in its aromatic

Piperaceae.—The characters of this family are so uniform that any of its members can be recognized through reference to these illustrations. Fig. 1 illustrates *Piper longum* and *P. betle*; Fig. 2, *P. nigrum*; Fig. 3, *Peperomia*.

and pungent properties. We are all familiar with the properties and uses of Pepper, Cubeb and Matiao, and these are shared by something like a thousand other species of the family, which are natives of the Old and New World tropics. In the pepper genus alone there are some five or six hundred species and, so far as my experience goes, they are practically all more or less pungent and disinfectant in their nature, and highly stimulant to the natural bodily functions. I have seen a great many of them confidently used in native practice in the treatment of serious disorders, and in some cases, a number of species would be used indiscriminately. In one extensive region I found an endemic disease called *espondia*, resembling some forms of cancer in its nature, symptoms and course, and regarded as almost invariably fatal to the natives attacked by it. Two of these natives, whom I had unsuccessfully treated with sulphuric acid charcoal paste, were afterwards completely cured by their fellow Indians through the continuous application, during several days and nights, of heated leaves of a species of Piper. The attendants worked in relays, the exhausted leaves being removed and fresh, hot ones applied at intervals of a few minutes.

The characters of these plants as indicated in the accompanying picture are unmistakable.

The members of a number of families are essentially aromatic, yielding volatile oils on distillation. While there are important differences in the action of different individuals of the same family, there is at the same time sufficient uniformity to enable the physician to use them almost indiscriminately for some purposes. It is therefore of considerable importance that the family characters of the aromatic plants should be readily recognized.

THE LABIATAE OR MINT FAMILY.

The members of this family are, almost without exception, good carminatives and intestinal disinfectants, as typified in the mints, thymes, marjorams and pennyroyals. Although poisonous effects may be obtained from excessive amounts of the volatile oils, the plants themselves must be considered as non-poisonous.

Labiatae Fig. 4, species of *Salvia*, well displaying the habit of leaves and inflorescence, as well as the bilabiate calyx and corolla. Fig. 5 shows variations in form of calyx and corolla, and good illustrations of diandrous and didynamous androecia. A and B show *Thymus*, C, *Hyssopus*, D, E, G and J *Setureia*, F, *Saccocalyx*, H, K and L, *Hedroma*, M, *Pogogyne*, N, *Thymbra*, O, *Ducrandra*, P, *Melissa*.

These plants are very easily recognized by their square stems, opposite, oilbearing leaves without stipules, usually bi-labiate calyx and corolla, diandrous or didynamous androecium and 2-carpelled ovary which divides in the fruit stage into four small nutlets. Members of this family are found in nearly all parts of the world and one could, with certain safety and efficiency, employ almost any plant possessing the foregoing characters for the effects mentioned.

THE LAURACEAE OR LAUREL FAMILY.

In this family, as typified by camphor, cinnamon, coto and sassafrass, we have still more powerful intestinal stimulants and disinfectants and these properties are even more uniform throughout the family than in the Labiatae. The natives of many tropical regions rely upon one or another of them in the treatment of the most severe intestinal disorders. The extracted active principles may be more actively poisonous than those of the former family, yet the drugs themselves are equally harmless, and one may resort to the use of any of their barks, the portion usually most active, without fear of harmful results, or doubt as to their medicinal value.

Fig. 6

Lauraceae —Fig. 6, typical flowers, showing the regular 6-parted perigone, with several sets of stamens, some of them imperfect, the 4 locellae of the anthers embedded in a large fleshy connective and the valvular dehiscence. A represents *Bailethymia*; B and C, *Ampelodesmos*; D, *Cryptocarya*; E, *Alouia*; F and G, *Aerodactylus*; H and I, *Laurus*; K and L, *Lindera*; M, the leaves and fruit of *Nectandra* well characterizing those of the family.

Lauraceous plants are rather rare in temperate and arid regions, but in most tropical forests they occupy about the same position as to abundance as do the oaks in our own forests, while the variety is vastly greater. A botanist who is familiar with the family is never at a loss to recognize one of them by their leaf-characters alone, although these characters can scarcely be described in words. By their flowers, however, as well as by their fruits, they are easily recognized. Their flowers are 3-nerous, with the ovary superior, there being two, three or four sets of stamens, one or more of the sets usually sterile, and the anthers almost always divided into four locellae, with valvular dehiscence, the upper pair of locellae smaller, and all four immersed in a fleshy, flattened connective. Whenever these characters are clearly seen, identity may be regarded as established. Nearly everyone knows the character of the Sassafras fruit, with a peculiar, more or less fleshy cup at the base. This is the fruit form that characterizes the family as a whole.

Still more easy of recognition are the third and fourth members of this group of aromatic medicinal families, namely the *Myrtaceae* and *Umbelliferae*.

THE MYRTACEAE OR MYRTLE FAMILY.

Myrtaceae—Fig 7 illustrates the opposite estipulate leaves, the 4- or 5-merous flowers, adherent calyx and numerous stamens borne on its margin. The leaves are pellucid-dotted. A to C represent *Eucalyptus*; D to H, *Pimenta*; J to M, *Mitranthes*.

The properties of this family are well and commonly made known through cloves, allspice, eucalyptus, cajuput and myrtle. Many of them are relatively weak in activity but pretty nearly all have oil-bearing leaves, and properties similar to those of the families already discussed. The plants are in practically all cases shrubs and trees. Their leaves are opposite and destitute of stipules, and bear pellucid dots indicating the oil glands. The flowers are almost without exception regular and are usually 4-merous. The ovary is inferior and the petals and numerous stamens are borne on the margin of the adherent calyx tube. Recognition is almost infallible.

THE ZINGIBERACEAE OR GINGER FAMILY.

This family of monocotyledons may be included among the useful carminatives and intestinal stimulants, and usually possesses in addition agreeable flavoring properties, as observed in ginger, turmeric, zedoary and cardamom.

Its members are free from poisonous properties as ordinarily used, so that one is quite safe in resorting to the use of one of them, if quite sure of its family. There is here, however, some danger of confusion with the related Iris family and it is necessary to be closely discriminating in selection. It is worthy of note that the ginger family is not represented in temperate regions, while plants of the Iris family, although not uncommon in the tropics, are more particularly char-

Iridaceae and Zingiberaceae—Fig 8 illustrates *Iris* with its three regular and perfect stamens. Fig 9 illustrates *Zingiber*, with only one of its anthers perfect, the others being petaloid.

acteristic of temperate and sub-tropical regions. The flowers of the ginger family are irregular and usually possess six stamens, but anywhere from one to five of these are destitute of anthers.

THE IRIDACEAE OR IRIS FAMILY.

Although this family is totally different in its physiological action and medicinal uses from the preceding, it is considered here because of a superficial similarity in the appearance of the plants of the two. This similarity need deceive no one, because the Iridaceae possess regular flowers, with only three stamens, all perfect.

The members of this family are, without exception so far as I know, strongly and usefully purgative, but they are irritant poisons, often violently so, in over doses.

THE UMBELLIFERAE OR PARSLEY FAMILY.

No family is more readily recognized than this one, notwithstanding that there are wide superficial differences. The most certain marks of identity are the umbellate flowers and fruits and the structure of the latter, consisting of two mericarps attached to a carpophore. Their alternate leaves have sheathing or clasping bases and mostly hollow petioles. These leaves are usually compound, as seen in parsley, carrot, celery and conium.

Unfortunately, we have no sure guide to the properties. The great majority of the members are innocuous, yet not a few, like conium and cicuta, are intensely poisonous. Some of the poisonous ones possess pleasant aromas, which have led to the occurrence of fatal accidents. On the whole, it can hardly be regarded as a safe procedure to employ these plants for their carminative properties, unless their individual identity and innocence have been established.

THE CONVULVULACEAE OR MORNING GLORY FAMILY.

Reference should be made, in passing, to the properties of the plants of this well-known family. They are quite uniformly purgative, usually in all parts of the plants. The sweet potato and several others are peculiar exceptions.

THE MAGNOLIACEAE OR MAGNOLIA FAMILY.

This is another aromatic family, but one which combines bitter qualities with the aroma and whose plants, almost without exception, are excellently useful as aromatic bitters and stomachics and, properly used, valuable antiscorbutics. In their physiological and medicinal properties, as seen in *Magnolia*, *Liriodendron* and *Drimys* barks, they are closer to the Laurel family than to any of the others previously discussed. One is quite safe in resorting to the use of these barks and very certain to secure the aromatic bitter effects referred to.

The family consists of shrubs or trees, with alternate, simple and mostly entire leaves, with or without stipules and aromatic in all their parts. They have numerous distinct stamens and distinct sepals and petals, and their numerous pistils are either distinct or immersed in an elongated fleshy torus.

THE ARISTOLOCHIACEAE OR SNAKE-ROOT FAMILY.

Passing reference may be made to this interesting and uniformly aromatic-bitter family, the members of which cannot be mistaken, if one sees either their flowers or their fruit. The experienced botanist will identify them with equal readiness upon merely seeing a leafy stem. Their use must be resorted to with caution, because some of them are rather strongly irritant poisonous.

THE RUTACEAE OR RUE FAMILY.

Fig. 11

Rutaceae. Fig. 10, *Chloroxylon*, well illustrates the habits of these plants, with their pinnate leaves, though often having only three or even a single leaflet, while Fig. 11 we'll illustrate the flower-forms which, although greatly varied, always present the same basic characters. The same forms characterize the *Simarubaceae*, except that its carpels are 1-ovuled.

This is another family which combines aromatic and bitter properties and which is in nearly all cases medicinal. Unfortunately its recognition is of but little practical value, partly because the medicinal properties are widely diversified, with no external indications of their nature, and partly because the plants are in most cases more or less poisonous, while in others little or not at all so.

The leaves are alternate and estipulate and usually compound. When held against the light they show pellucid dots, as is so well known in rue, buchu, jaborandi and orange leaves. The flowers are 4- or 5-merous and the carpels are separate or united only at the base or, at the most, so united as to result in a lobed fruit. The cells of the ovary are almost invariably 2-ovuled.

A number of families are uniform in their possession of bitter properties, without any considerable associated aroma, and are commonly used as simple bitters.

In this connection, the following may be noted:

THE SIMARUBACEAE OR QUASSIA FAMILY.

Although quassin and some other principles extracted from the plants of this family are poisonous, the plants themselves are scarcely so, notwithstanding that there are records of mild poisoning, in the form of chronic gastritis, resulting from their continuous use, as from drinking water permeated by extracted matters from the *Ailanthus*. Almost without exception, these plants may be usefully employed as simple bitters.

They are very easy of recognition, possessing all the characters of the *Rutaceae*, except that there is but one ovule in each carpel and the leaves have no pellucid dots.

THE MELIACEAE OR AZEDARACH FAMILY.

In connection with the *Rutaceae* and *Simarubaceae*, brief reference should be made to the *Azedarach* family. Nearly all of its plants possess nauseating expectorant or even emetic properties similar to those of ipecac, as seen in *Azedarach* and *Cocillana* barks, and in *Narcgamia*.

The plants have a very similar habit to that of the *Simarubaceae*, having alternate compound leaves without pellucid dots. The general flower-structure

Meliaceae. The habit of these plants is much the same as that of the *Rutaceae* and *Simarubaceae*, but the filaments form a cup, with the anthers at its margin.

is similar, but the filaments form a cup, with the anthers borne at or near its summit.

BERBERIS AND ITS ALLIES.

The properties of this entire group are typified in those of the species of *Berberis* which have been employed so generally in medicine, and are due to the constituent berberine. There is not the slightest difficulty in recognizing them on the part of one who has become familiar with any species of the genus.

THE SALICACEAE OR WILLOW FAMILY.

This remarkably uniform and important family may well be included among those distinguished for bitterness, although, in addition, it has highly important anti-rheumatic and anti-periodic properties, due to itsalicin and populin, and astringent properties due to its rather large percentage of tannin. These properties are shared by every member of the family, so far as known.

Berberis vulgaris; the members of this genus present so similar an appearance that familiarity with one will lead to the recognition of all.

Salicaceae.—A, B, C, E, F and G illustrate the flowers, with their entire scale, of *Salix*. D and H show those of *Populus*, the scale being limbate.

their branches, often only an inch or two in length.

THE GENTIANACEAE OR GENTIAN FAMILY.

This family perhaps surpasses all others in the vegetable kingdom in the uniformity of its medicinal properties, as typified in *Gentian*, *Chirata*, *Erythraea*, *Sabbatia* and *Menyanthes*. Although these properties are of the simplest possible nature, those of the simple bitters, promoting the appetite and digestion and generally exciting healthy functional activities, they are of much importance in both scientific and domestic medicine. Inasmuch as these plants are most widely distributed through both sub-tropical and temperate regions, so that one can scarcely fail to find one or more of them in almost any region where he may be, and since such plants are almost invariably uniform in the possession of this property, and are equally uniform in being free from toxicity, it becomes of the greatest value to be able to recognize their family relationship at sight. I do not remember to have

Gentianaceae.—Here we see the same opposite leaves without stipules, and the tubular corollas with adherent stamens which characterize the other families of the order *Gentianales*, but here we have a one-celled though two-carpelled pistil. A to C represent *Sebaea*; D to F, *Lagenaria*; G to P, *Belmontia*.

or less toxic, but in the ordinary sense of the term, the plants are not poisonous. They are, however, highly medicinal. The number which are effectively employed in native and domestic practice and which are practically unknown in professional medicine, is large. Were all other vegetable drugs to be lost and the world forced to depend upon this family, the variety and value of its drugs would undoubtedly cause surprise in scientific circles. It is not too much to say that recognition of a plant as belonging to this family justifies a presumption of its medicinal activity. Unfortunately, we cannot so judge of the nature of those activities, since they are of a very diverse character.

No other family of plants is more easy of recognition. Its adherent calyx and tubular corolla are shared by a number of others, but a glance at its opposite leaves with stipules suffices for identification. These stipules constitute one of the great features of interest in the family, forming its chief field of variation and specialization, and the classification of its genera can be based largely upon them.

The only families, the distinction of whose members from those of the *Rubiaceae* is difficult, and this only on superficial observation, are the *Verbenaceae* and *Apocynaceae*, both of which possess opposite leaves, often closely resembling those of the *Rubiaceae*, but never having stipules.

The plants of the *Verbenaceae* are non poisonous, so that a mistake would

ever visited any such region where I could not have supplied myself with a good simple bitter derived from this family, had the necessity arisen.

These plants have opposite 'stipulate leaves, tubular corollas and adherent stamens, as do those of the other families of this order, the *Gentianales*, several of which are to be considered later. The ovary, however, is always one-celled, and the placentae are parietal. They are devoid of milky juice and have a bitter taste. There is, moreover, no stigmatic ring, as in the *Apocynaceae*.

THE RUBIACEAE OR MADDER FAMILY.

This great family, of nearly four hundred genera, and five thousand species, rich in dyestuffs, may be regarded as pre-eminent in the vegetable kingdom in the production of alkaloids, its only rival in this direction being the poppy family. Unlike the latter, it is almost free from poisonous properties. It is true that such drugs as cinchona, coffee and ipecac contain principles more

Rubiaceae.—Fig. 16 illustrates the flowers and fruits. The calyx is completely adherent to the ovary, the corollas are tubular and the filaments are adherent to it. The fruits are dicarpellary. A to L, *Chimarrhis*; F and G, *Rustia*; H, *Condaminea*; J to L, *Tresanthera*, M to O, *Pinckneya*; P, *Pogonopus*.

Fig. 17 illustrates a variety of stipules pertaining to the family Rubiaceae.

not be serious. Their medicinal importance is slight, merely because they have been little used in scientific medicine. They are by no means devoid of medicinal properties, even the humble vervain being entitled to a distinct position in the materia medica.

THE APOCYNACEAE OR DOGBANE FAMILY.

Hardly any other family of plants is of greater interest in my discussion than this one, from the standpoint of medicine as well as of toxicology. With the poisonous properties of *Strophanthus*, *Apocynum*, *Holarrhena*, *Kicksia*, *Oleander* and *Geissospermum* most of us are familiar, but those of *Landolphia*, *Allamanda*, *Plumiera*, *Vinca*, *Rauwolfia*, *Voucanga*, *Malouetia* and *Echites*, as well as the arrow poisons *Carissa*, *Akokanthera*, *Cerbera*, *Thevetia* and *Wrightia*, are not so generally known.

With few exceptions, the other members of the family, which are very numerous, share in these poisonous properties. These plants are exceedingly abundant and generally distributed throughout the tropical forests of both the Old and New World, so that it becomes a matter of first importance that one thrown upon his own resources should be able to recognize them at sight. This is no less important from the medical point of view, since they are with equal regularity

medicinally active as circulatory stimulants. It would be a somewhat difficult matter to find any extensive locality in the South American forests where one would be unable to find, within an hour's search, some member of this family which he could safely and effectively employ in this way.

Apocynaceae Stigma.—A illustrates *Landolphia*, showing the general habit, opposite estipulate leaves and tubular flowers. B illustrates *Strophanthus*, showing the tubular corolla, with adherent stamens, the anthers adhering to the stigmatic ring. C illustrates various forms of the stigmatic ring.

Aside from other characters, the members of this family are distinguished from all others by the character of the pistil. While its two ovaries are separate, and form separate fruits, its styles above the ovaries are united and possess near the summit a peculiar ring or band surrounding the style just below the stigma, to which the anthers are attached. This character, taken in connection with the opposite, estipulate leaves, milky juice and tubular flowers, renders recognition instantaneous and infallible.

Through gross carelessness, one might mistake a member of the closely related milkweed family, *Asclepiadaceae*, for this one. It also has opposite estipulate leaves, a milky juice and tubular flowers. There are peculiarities in the leaf-characters which will enable experienced botanists to tell the one from the other, although the method of doing so could not be characterized in words. The flowers, however, are quite different, being devoid of the united styles with stigmatic ring and having the pollen grains coherent in pollinia or pollinaria.

This family is destitute of the heart-stimulant properties of the *Apocynaceae* and their medicinal value is not great.

Verbena.—A shows the opposite estipulate leaves and tubular flower, as in *Apocynaceae*, but there is no similarity whatever in the pistil.

THE LOGANIACEÆ OR NUX VOMICA FAMILY.

Closely related to the *Apocynaceæ* stands the pre-eminently poisonous family, *Loganiaceæ*, known in medicine by *Gelsemium*, *Strychnos* and *Spigelia*. The plants of the two families bear a striking superficial resemblance, but those of the *Loganiaceæ* have no milky juice and possess a single two-celled ovary instead of the two distinct ovaries of the *Apocynaceæ*, and are wanting in the stigmatic ring. This is a small family and its plants are almost uniformly violently poisonous. On various occasions, on encountering unknown members of this family in the tropics, I have inquired of the natives as to their properties and have never yet failed, if the natives possessed any knowledge concerning them, to be informed that they were poisonous. Aside from its important uses in medicine, this family yields largely of materials used in arrow poisons. *Potalia* is much like *Strychnos* in its action. In Mexico and in the South American Andes, I have found many species of *Buddleia* credited with dangerously poisonous properties. It is unfortunate that, although these plants are almost always medicinal, we are unable to generalize as to the nature of the medicinal properties.

Loganiaceæ—*Gelsemium* well displays the opposite stipulate leaves and tubular corollas, with adherent stamens, as in *Apocynaceæ*, but there is a single ovary and there is no stigmatic ring.

THE PAPAVERACEÆ OR POPPY FAMILY.

The members of this family are almost invariably alkaloidal in their composition and their alkaloids, in most cases, agree in being locally irritant and systemically narcotic, and more or less strongly poisonous. Practically every one which has been physiologically investigated has been found active, and most of them medicinally useful. Unfortunately, these medicinal properties are not sufficiently uniform to allow of generalization, but it may be said that any member of the family is worthy of chemical and medical investigation.

To one not familiar with the genera of this family, the fruit characters offer the best means of recognition. These fruits are for the most part similar to those

Papaveraceæ.—Illustrates the fruits: A, that of the Poppy, is an exception; B, *Argemone*; C, *Glaucium*; D and E, *Macleaya*; F and G, *Eschscholtzia*; H, *Hypericum*; J and K, *Corydalis*; L, *Adlumia*; M, *Fumaria*. The blood-root pod is similar to that of *Eschscholtzia*. The two pictures at the right show the spurred flowers of the *Adlumia* branch of the family.

of the bloodroot. One of my most interesting experiences in field work was in connection with a member of this family, a species of *Bocconia*. Riding my mule along a mountain trail, a pendant cluster of fruits brushed across my face. Instantly, by force of habit, I caught at it and secured a specimen. On examining it, I was struck by its close similarity to that of our common bloodroot. Dismounting, I turned back and found that it was borne upon a small tree, the bark of which exuded a thick, blood-red juice when punctured. A quantity of the bark was collected and at my first stopping place was tested. It presented undoubted evidence of containing several alkaloids. Inquiring among natives of the neighboring village, I was informed that the leaves yielded an important domestic medicine, and that its name was "Hamakari." Among the other curious things which were told me was that infants dangerously ill with fever were wrapped in the large poppy-like leaves, after strongly heating the latter at the fire. If the leaves turned black after being for some time against the skin of the infant, the indications were favorable; otherwise a fatal result might be expected. I presume that this conclusion rested upon the fact that if the infant perspired, the perspiration would cause color reactions, turning the leaves black.

Ranunculaceae Fig. 22 illustrates *Hydrastis*, with all parts of the flower free and distinct

THE RANUNCULACEAE OR BUTTERCUP FAMILY.

The members of this family almost invariably contain juices which act as local irritants, and this property is in many cases found to reside in specific chemical principles such as we find in *Aconite*, *Larkspur* and *Hydrastis*. As irritants alone, these plants possess little medicinal value, but it so happens that they are also almost uniformly circulatory depressants. In *Adonis* and one or two others, we find exceptions to the rule, but the latter is sufficiently uniform to enable one thrown upon his own responsibility to rely with considerable confidence upon obtaining results in this direction by the use of a member of this family, even though he had no specific knowledge concerning it.

The family is easily recognized by its alternate, usually lobed or divided leaves, without stipules, but having the base considerably dilated. Its flowers are free and distinct in all of their parts, except for the rarely and partially coherent carpels.

THE LILIACEAE OF LILY FAMILY.

The properties of this family, as is true of the *Ranunculaceae*, are not absolutely uniform, yet they may be regarded as almost the exact counterpart of those of the latter, its members, as seen in *Squill*, *Lily-of-the-valley*, *Garlic*, etc. being almost always circulatory stimulants and powerful promoters of glandular activity.

THE LOBELIACEAE OR LOBELIA FAMILY.

In discussing this family, I desire to state that I wholly exclude from it the closely related family *Campanulaceae*, notwithstanding that many botanical authorities believe in uniting the two.

The *Lobeliaceae*, so far as known, are all powerfully poisonous, their properties being typified in our *Lobelia inflata*. For this reason it is important that they be

recognizable at sight. As poisons, they are intensely irritant and decidedly narcotic. *Isotoma longiflora*, of Cuba and other West Indian islands, has been declared by one distinguished medical botanist to be the most poisonous of all plants. Doubtless this view is incorrect, since I have known the same thing to be said in other tropical regions of various species of *Siphocampylus* and *Centropogon*, their juices so irritant that they are frequently spoken of as being "caustic." There is record of one member of this family being non-poisonous, it being claimed that the New Zealand *Laurentia* is eaten as a pot-herb. I have little doubt that there is some error connected with this report. I should expect to be poisoned were I to eat this plant.

Aside from its toxicological interest, this family, carefully used, is capable of great medicinal utility, the properties being uniformly those of our *Lobelia inflata*.

The more powerfully poisonous division of this family is distinguished by its ascending or centripetal inflorescence, irregular corolla, almost always fissured on the upper or inner side, and its anthers, usually also its filaments, being connate and irregular. Its calyx tube is always adnate. Recognition is easy and certain.

THE LEGUMINOSAE OR BEAN FAMILY.

In this instance, I include all three of the sub-families, now regarded by most botanists, myself included, as being separate families. It is quite useless to attempt to generalize as to the medicinal or poisonous properties of so diversified a group. My only object in referring to them here is to indicate their dangerous character. To those who know only the few and mostly small plants growing wild in our region, the most of them so harmless as to constitute important fodder plants, this statement may seem unwarranted, but those who know of the vast extent and abundance of this family in the tropics, where they largely compose the forest growth, will know that the statement is not an exaggerated one. The seeds of this family, and in many cases the seed-pods and foliage also, are highly albuminous and nutritive and may in emergencies be sought as food, as I have myself sought them and with great advantage. The difficulty is that, as in the case of the calabar bean, the wild lima bean and the locoweed, they often contain subtle and dangerous poisons. It must thus be regarded as an unsafe proceeding to resort to the use of any of them without some specific knowledge of their properties.

These plants are most easily recognized. Like the *Rosaceae*, they have alternate, stipulate leaves, five petals and perignous stamens. They differ from it in having but a single carpel, usually with more than two ovules, but sometimes with only one. Their leaves are usually compound. The botanist who has become at all familiar with the family however, invariably recognizes it at sight without requiring recourse to technical characters.

THE SOLANACEAE OR POTATO FAMILY.

Although widely separated in the vegetable kingdom from the family last considered, the two remind us in many ways of one another. Like the *Leguminosae*, the *Solanaceae* are permeated by many subtle and highly dangerous poisons, although their chemical nature is altogether different. Like the *Legu-*

Lobeliaceae.—Illustrates *Siphocampylus*, which is very similar to *Lobelia*. The corolla is fissured and through the fissure projects the coherent anthers which are well shown in B and C. E shows the calyx-tube adherent to the ovary. D shows the two stigmas and F, a cross section of the pod

minosae, the *Solanaceae* yields many important edible products and, like it, its vegetable products are quite likely to attract the traveler who is in need of food supplies. To yield to this temptation is to court disaster, as one has never any means of knowing how the experiment is likely to terminate. Even the odor and

Solanaceae. This important family is so large and variable as to require a number of illustrations. Fig. 24 shows the characteristic flower forms, with tubular corollas, 5 alternate stamens and 2 carpelled ovary, producing a berry for a fruit. A to C *Grabowskia*; D and E, *Oryctes*; F and G, *Danalia*; H, *Margaranthus*; J, *Hebecladus*; K, *Poecilochroma*; L and M, *Litsea*. N *Lochroma*; O and P, *Cocabus*; Q *Phrodus*. Fig. 25 illustrates the capsular-fruited division of the family, as seen in A to J, *Hyoscyamus*; K *Scopolia*; L *Physalis*.

flavor are often misleading guides, these agreeable properties sometimes being associated with highly dangerous ones.

The members of the Potato Family, so far as we are here interested in them, have regular gamopetalous corollas, stamens alternate with its lobes, alternate estipulate leaves, two-celled fruits and the carpels containing numerous ovules. The corolla is plicate in aestivation and the fruit either a berry or a capsule.

THE ROSACEAE OR ROSE FAMILY.

In connection with the astringent properties of the willow family, one may well refer to those of the rose family, the members of which are almost without exception heavily provided with tannin. I refer here of course, to the Rose Family proper, not including the *Drupaceae* or Plum Family, nor the *Pomeaceae* or Apple Family. Through the Raspberry, Blackberry, Strawberry, Potentilla, Agrimonia, Spirea and many others, scientific and domestic medicine has for ages been furnished with an abundance of simple astringents of great efficacy. Since the related genera, with similar properties, are very numerous and most widely distributed, it becomes a matter of no little importance to be able to recognize the members of this group at sight. This is to be done by noting their stipulate leaves, usually compound, as seen in roses, blackberries, strawberries, etc., their five regular petals, numerous perigynous stamens, two-ovuled, mostly distinct carpels and style arising laterally from the ovary.

Only a word need be said in conclusion regarding the several families grouped under the old name *Coniferae*. Everyone is able to recognize any member of this group at sight and their medicinal and poisonous properties are too well known to call for any discussion.

BRAZILIAN JALAP.*

BY WILBUR L. SCOVILLE.

In 1915 a brief article was published in the *Pharmaceutical Journal*¹ of London by E. W. Holmes stating that Brazilian jalap had been for some time imported into Germany and used as a cheap source of resin of jalap. He had therefore procured some of the drug, which was identified as the root of *Piptostegia pisonis* and was examined chemically by Dr. F. W. Passmore. The latter found that the root contained over 20 percent of resin which answered to the U. S. P. & Ph. Br. tests for true resin of jalap, but only 85 percent of it was soluble in ether, and it contained 8.9 percent of ash.

A search of pharmaceutical and chemical literature has failed to disclose any further account of this drug or its chemical composition. Accordingly a small amount was procured from Brazil and examined as follows:

Forty grammes of the ground drug was exhausted with 95 percent alcohol in a Soxhlet apparatus and the tincture diluted to 200 mls. This tincture yielded 7.04 percent of dry solids equivalent to 35.2 percent of extractive in the drug, and on subjecting it to the U. S. P. method of assay for resin of jalap, gave 5.64 percent of resin in the tincture, equivalent to 28.2 percent in the drug. The resin was a light buff color, slightly hygroscopic, and it melted under boiling water.

Five hundred grammes of the drug was then extracted with alcohol, the tincture was concentrated by distillation to a syrupy liquid measuring about 180 mls and this was poured slowly into about 7500 mls of cold water containing a little hydrochloric acid. The resin precipitated at first in a fine powder but quickly agglomerated into a sticky mass at the bottom of the jar. It was washed several times with water, then collected and dried, yielding 132.5 Gm. of resin, equivalent to a 26.5 percent yield from the drug.

Portions of this resin were shaken with petroleum benzine, benzol, ether, chloroform, and acetone, and the clear liquids evaporated. By this method it was found that 3.7 percent was soluble in petroleum benzine, 5.3 percent in benzol, 5.9 percent in ether, 19.55 percent in chloroform, and 99.4 percent in acetone. It was nearly all soluble (97.5 percent) in a 1 percent solution of potassium hydroxide, and the addition of acid to this alkaline solution did not reprecipitate the resin.

On shaking 1 Gm. of the resin, mixed with 5 Gm. of washed sand, with 100 mls of distilled water for several hours at room temperature, and filtering, 0.535 Gm. was found to be dissolved by the water. This is a remarkable solubility for a resinous body, and probably accounts for the fact that it could not be precipitated as a powder, even in ice-cold water, but always separated as a soft, sticky mass. On ignition the residue yielded 0.5 percent of ash—considerably less than was obtained by Doctor Passmore.

The acid number, as obtained by the U. S. P. process, was 23.1 and the saponification number was found to be 141.6. An alcoholic solution of the resin gave no color with a solution of ferric chloride and did not reduce Fehling's solution. But on heating the alcoholic solution with sulphuric acid a strong odor of valeric acid appeared and the neutralized liquid reduced Fehling's solution, showing that the resin is of a glucosidal nature.

Two grammes of the resin dissolved slowly in 10 mls of ammonia water, producing a cloudy but limpid solution, and the addition of an excess of hydrochloric acid did not precipitate the resin.

Since the U. S. Pharmacopœia requires that not more than 12 percent of the resin of jalap shall be soluble in ether, and not more than 30 percent soluble in chloroform, this resin of Brazilian jalap will meet the U. S. P. requirements except as to solubility in water and the acid-resin test, which it slightly exceeds. Even

* Read before Scientific Section, A. Ph. A., Chicago meeting, 1918.

¹ *Pharm. Journal*, 1915, page 671.

the water-solubility test is greatly changed by the presence of a little acid, and the addition of acid to the clear aqueous solution produces a marked precipitate. Probably the temperature also affects the solubility markedly, since hot water dissolves it more readily. To further ascertain its character 100 Gm. of the resin was treated successively by percolation with petroleum ether, ether, chloroform and acetic ether.

The petroleum ether extract yielded 2.09 Gm., and was a reddish, oily, viscid liquid, mostly soluble in alcohol and having a markedly acid reaction. Its acid number was 12.9 and the saponification number 116.

The ether solution yielded 2.376 Gm., was solid and of a buff color, resembling the original resin, had an acid number of 82.6 and a saponification number of 62.5.

The chloroform solution yielded 2.424 Gm., was solid, crystalline and showed an acid number of 10.1 and a saponification number of 58.5.

Acetic ether dissolved all of the remainder of the resin, and this portion gave an acid number of 16.8 and a saponification number of 161.3.

All these extracts therefore contained free acids, the ether solution being richest in them, and also fatty esters.

Comparing these with an investigation of resin of jalap by Frederick B. Power and Harold Rogerson (International Congress of Applied Chemistry, 1909), an investigation which was very complete, and which established the very complex character of resin of jalap, they found the following:

| | |
|--------------------------------------|--------------|
| Soluble in petroleum ether | 1.9 percent |
| Soluble in ether | 9.7 percent |
| Soluble in chloroform | 24.1 percent |
| Soluble in ethyl acetate | 22.0 percent |
| Soluble in alcohol | 38.8 percent |

The above were obtained by successive treatments, and represent the percentages which were dissolved after the preceding solvent had been employed.

Solubility results are not directly comparable unless obtained under identical conditions and with the same amounts of solvents. Presumably the above solubilities were obtained by extracting the resin, previously mixed with purified sawdust, in a Soxhlet apparatus, using the solvents successively. This would result in a thorough extraction of all substances which are soluble in the particular solvent used. In my work the powdered resin was simply shaken for several hours with about four times its volume of the solvent, the latter decanted, and the resin rinsed with fresh portions of solvent. In this method only the more readily soluble constituents would be extracted.

It is evident, however, that the Brazilian resin is less soluble in ether and much more soluble in ethyl acetate.

On analysis of the various fractions of the resin, Power and Rogerson found formic, acetic, butyric, valeric and other higher volatile acids, also palmitic, stearic and convolvulic acids, and by hydrolysis azelaic and sebacic acids, and a new acid which they had previously found in the root of *Ipomoea purpurea*, and which they called ipurolic acid.

The neutral bodies found were cetyl and ipurganol alcohols, a physosterol, beta-methylaesculetin and glucose, the latter showing the glucosidal nature of the resin.

I did not attempt so complete a separation of the constituents of Brazilian jalap resin, but formic and valeric acids were recognized by their odor and the

former was identified by chemical tests, glucose was produced by hydrolysis with sulphuric acid and the ready saponification of some of the fractions strongly suggested stearic or similar acids. If ipurolic acid could be separated and identified, the chemical similarity of the two resins would be established.

In their work on *Ipomoea purpurea* Power and Rogerson separated this acid as follows:

The resin was hydrolyzed by heating in alcoholic solution, containing enough sulphuric acid to make a 5 percent acid solution, for four hours under a reflux condenser. The alcohol was then removed, and the hydrolyzed resin distilled with steam. When the liquid in the still had cooled, the acid separated in fine, interlaced crystals from the aqueous fluid and was collected by filtration. It was found to be readily soluble in a weak solution of sodium hydroxide, and after rendering this acid with acetic acid the crystalline body was extracted with chloroform. To further purify it, it was again crystallized from hot water, in which it is slightly soluble. The melting point was then found to be 161° C.

On applying this process to the resin of Brazilian jalap, an acid body separated in the still and was purified by dissolving in weak sodium hydroxide solution and extracting with chloroform after acidulating. On recrystallizing from hot water it was obtained in colorless condition and had a melting point of 83.5° C. Further purification showed no change in the melting point.

It combined readily with weak alkalis, and had a saponification value of 174, as found by direct titration in alcoholic solution with decinormal alcoholic potassium hydroxide. This is a lower saponification number as well as a lower melting point than that of ipurolic acid. It is therefore a different body, but it is obtained in the same way, and does not correspond to any of the commonly known organic acids.

The resin of Brazilian jalap is thus shown to be similar in chemical character to that of *Exogonium Purga*. It is a complex body of a glucosidal nature, and contains constituents of like character. This resin meets the U. S. P. requirements for resin of jalap except that of solubility in water and the acid number. The yield is three to four times as great, and the physiological action is similar.

LABORATORY OF PARKE, DAVIS & CO.,
DETROIT, MICH.

KARAYA GUM, A SUBSTITUTE FOR TRAGACANTH.*

BY CLARE OLIN EWING.

The commercial value of a gum depends largely upon the purpose for which it is best suited, the most valuable generally being those varieties suitable for sizing silks and for use in confectionery and pharmacy. For pharmaceutical use the desirable qualities are a fairly high viscosity, suitable adhesive power, and freedom from appreciable odor, color and acidity. One of the gums which admirably fulfills these requirements is gum tragacanth, which is highly prized by pharmacists and is official in most pharmacopoeias. It is defined by the United States Pharmacopoeia IX (1916) as "The spontaneously dried gummy exudation from the stems of *Astragalus gummifer* Labillardiere, or from other Asiatic species of *Astragalus* (fam. *Leguminosae*.)" Gum tragacanth belongs to the class of gums

* Contribution from the Pharmacognosy Laboratory, Bureau of Chemistry, Department of Agriculture, Washington, D. C.

which swell in water and form jellies, and upon addition of more water, form thick, transparent mucilages.

Recent examination of samples of gum tragacanth offered for importation has disclosed that in some instances foreign gums have been substituted for the true material. The samples in question were not obtained from the official source, but were of the type obtained chiefly from *Sterculia urens* Roxburgh, and also from *Sterculia villosa* Roxb., *Sterculia tragacantha* Lindley, or from *Cochlospermum gossypium* DeCandolle, and other species of *Sterculia* or *Cochlospermum*. These gums have recently been imported under the names of Indian, Karaya, Kadaya and Maura gum. Owing to the large number of dialects spoken in India, they have been known by a wide variety of vernacular names. According to Dymock¹ and to an anonymous writer in the *Scientific American*² they have also been variously known by the names Bali, Gulu, Kahu, Kalru, Kadu, Kandul, Karai, Katila, Katira, Kavali, Kawali, Kutera, Kuteera, Kutira, Loli, Pandruk, Penari, Shiraz, Tabsu, and Velley-putali. The names most common in this country are Indian gum and Karaya gum. We consider the latter name preferable to Indian gum, especially in view of the fact that the term "Indian Gum" has been applied to a number of different gums. The Indian gum (*Gummi indicum*) of the British Pharmacopoeia is obtained from *Anogeissus latifolia* Wallroth, and belongs to the acacia series of gums.

Karaya gum belongs to the tragacanth series of gums, and in the powdered state may readily be mistaken for true gum tragacanth. It is reported to exude from the trunk in large quantities. In the whole state it occurs in irregular, rounded, translucent lumps of a pale buff color; it is said never to occur in the ribbon-like whitish or light brown bands characteristic of true tragacanth. It may be differentiated from tragacanth chemically and macroscopically by a number of tests given in the United States Pharmacopoeia IX,³ where it is referred to as "Indian Gum" in the tests of purity of gum tragacanth, and also by its "volatile acidity"⁴ which is about eight to ten times as great as that of tragacanth.

Although, according to Guibourt⁵ the fresh gum is inodorous, when it is exposed to moist air it gives off an odor of acetic acid. Robinson⁶ has shown that the volatile acidity of gum from *Cochlospermum gossypium*, when hydrolyzed with phosphoric acid and distilled, corresponds to about 14 or 15 percent of acetic acid. Emery⁷ has examined 56 samples of gum tragacanth, some of them authentic specimens obtained from Turkey and Persia, and has shown that the volatile acidity corresponds to about two or three percent of acetic acid only, while the acidity of gum obtained from *Sterculia urens* (21 samples) corresponds to about 16 percent of acetic acid. The similarity in the results of Emery and Robinson are noteworthy and suggest the close similarity of *Cochlospermum gossypium* and

¹ Dymock, Warden and Hooper, *Pharmacographia Indica*, I, 228 (1889-90).

² "What is Karaya Gum," *Scientific American Supplement*, 2137, 82, 393 (1916).

³ These tests are apparently based upon the work of Scoville, *Drug Circ.*, 53, 116-7 (1909).

⁴ "The Volatile Acidity of Gum Tragacanth Compared with that of Indian Gum," U. S. Department of Agriculture, *Bureau of Chemistry, Circular* 94, 3 (1912).

⁵ "Histoire Naturelle des Drogues Simples," 3, 454 (1876).

⁶ "The Gum of *Cochlospermum Gossypium*," *Journal Chemical Society Transactions*, 89, 1496-1505 (1906).

⁷ *Loc. cit.*

Sterculia urens. Cooke⁸ has indeed suggested that *Cochlospermum gossypium* has incorrectly been separated from the *Sterculiaceae*.

When moistened with water, karaya gum absorbs a large quantity and, like tragacanth, swells to several times its original size, forming a tasteless, nearly colorless mucilage. A 1 percent mucilage prepared by the writer from a good grade of karaya gum had a viscosity similar to that of a mucilage of tragacanth of about three-fourths the same concentration; a 1.5 percent mucilage of karaya was comparable to a 1 percent mucilage of tragacanth. The adhesiveness of a 1 percent mucilage of tragacanth was superior to that of a 1 percent mucilage of karaya gum.

Prebble⁹ states that: "From some comparative experiments made with codliver and castor oils it appears to be about equal to tragacanth as an emulsifying agent." Pluckiger,¹⁰ speaking of a similar gum from the related African species, *Sterculia tragacantha*, states that "as a means of promoting the adhesiveness of pilular masses I find" it "as advantageous as ordinary tragacanth," and also that "the African *Sterculia tragacantha* may be used both in pharmacy and in the arts instead of the usual drug of Asia Minor."

Maiden states¹¹ that the "uses of the gum are very limited; * * * From time to time samples have been sent to Europe for valuation but hitherto no use has been found for it and consequently it has no appreciable value in the markets. The only purpose for which it has hitherto been considered valuable is as an adulterant of tragacanth, but hardly as a substitute."

On the other hand, Dymock¹² states "Karai gond [Karaya gum] is used as a substitute for tragacanth and is issued from the [British] government stores."

Maiden did not appear to have a very good opinion regarding the possibility of karaya gum in the arts, but his work was done nearly thirty years ago at a time when even tragacanth was not as widely used in the arts as at the present time, and when the possibility of the use of karaya gum for technical uses had not been developed to any extent. Maiden, furthermore, refers to Cooke¹³ who, he states, found it to be valueless as a result of his experiments. Reference to the original, however, shows that Cooke's "experiments" consisted in the submission of several samples to commission merchants, who based their statements as to its lack of value upon mere inspection, unsupported by any chemical data or practical experiments.

Karaya gum is used extensively in India as a substitute for tragacanth in the preparation of sweetmeats, and also locally as a demulcent in the treatment of throat affections. The poorer grades are used very extensively in this country by calico printers. As an emulsifying agent karaya gum appears to be of value as a substitute for tragacanth, although from one-third to one-half more should be used, but on account of the slight acidity of karaya gum its use in certain prepara-

¹³ *Loc. cit.*

tions may be objectionable. In general, however, this characteristic should not militate against its use as an excipient for pills and troches.

As may be seen from the foregoing, although inferior to tragacanth, karaya gum does have valuable characteristics, and its use for legitimate purposes should be encouraged. It is now selling for one-fourth to one-fifth of the price of tragacanth, and on account of its cheapness it is now being used rather extensively in the arts as a substitute for tragacanth. Karaya gum is considered especially worthy of the attention of pharmacists at this time because solutions of tragacanth and other gums¹⁴ are being recommended in quite a number of preparations as substitutes for glycerin, which is now in very large demand for war purposes.

CONSERVATION IN PHARMACY.*

BY A. R. L. DOHME.

These are abnormal times in which we are living, and standards of all kinds have been changed to meet the conditions set by a war which has no standard by which to measure it—exceeding in extent, intensity, destruction and influence on the entire world and everyone in it, that of all previous wars combined. The aim of the war now existing for about four years has been general and mutual destruction of all things. The magnitude of the operations and the world-wide nature of the same has taxed the resources of all nations to the limit. In money, the yard-stick is now billions—a figure previously only relegated to the imagination. In steel, ships, copper and explosives, the yard-stick is nation's entire output; in men, clothes, sugar, flour, cereals and foodstuffs, the yard-stick is the utmost capacity of the earth's productivity and the man power of the earth to supply and produce it. All laws are continually changing and freedom of action, thought or belief no longer exists anywhere on the earth. The press now rules the world and creates not only sentiment, position, influence and power, but holds in the palm of its hand the destinies of life of all peoples and individuals. Absolutism and terror now reign supreme all over the earth. It has become the solemn and serious duty of this great country of ours to step into the breach of the European cataclysm and holocaust and by the power of its manhood, the sacrifice of its people, the use of its vast resources in money and materials and the throwing into the balance of its determination, ingenuity and persistence, stay the onslaught of the Teuton columns and save the world from the rule of autocracy and might, thereby preserving for mankind the institutions of liberty, freedom and the pursuit of happiness. Without our intervention the cause of the Allies would have been lost. What a glorious opportunity for the land of the free and the home of the brave to come to the rescue of a tottering world about to fall a prey to Junkerism and the Divine right of kings. It hence becomes our duty, each and everyone of us, to do our share in every way we can by putting our shoulder to the wheels of the car of liberty and help it arrest the advance and eventually

smother and destroy the car of Juggernaut, led and kept going by the war party or lauded aristocracy of Germany. Our share is to supply the medicines needed to cure the sick, heal the wounded and sustain the well, as well as to conserve all resources that enter into our lives and our business activities. Let us remember, however, that we must not sacrifice our main vocation and duty, which is the supplying of medical supplies, or in any way weaken or hamper it, by a false conception of a so-called patriotism claiming to conserve our needed raw materials for said medicinal agents.

Some ill-advised persons have apparently, under the guise of said so-called patriotism, appealed to the drug trade to change its formulas of medicines so as to conserve sugar, alcohol and glycerin. Assuming that these persons meant well and were not actuated by a desire to shine as patriots, so-called, I am prepared to prove and am therefore going to assert that their plea for conservation of these three important ingredients of medicines was impossible and in fact, dangerous. In the first place, these products are subject to Federal laws which are an integral part of the statutory law of the land and they cannot hence be altered without subjecting the maker of the product to the penalties of the law. In the second place, a change of formulas established after many decades of experience and study would, beyond question, subject the preparations to change in strength and keeping qualities that might and probably would render them of doubtful value. This probably would endanger the lives of both our soldiers and our civilians and this is something no patriot so-called nor a real patriot would or should dare to do. No chemist or pharmacist to-day can definitely say or determine without prolonged study and observation to what extent a reduction of alcoholic or glycerin strength will alter and depreciate the value or the utility of a medicinal preparation. The whole question was discussed at a hearing held by the U. S. Food Administration at Washington, attended by many of the experts of the Government including Doctors Alsberg and Kebler and by the writer and Dr. Frank R. Eldred, on behalf of the pharmacists of the country. It was first shown that there is no need to conserve alcohol any way, as there is more than enough for all needs for years to come, without considering at all the vast stores of damaged corn all over the land seeking sale for conversion into alcohol, as it is not fit for food. Next it was shown that the amount of sugar used in medicines is less than half of one percent of the amount used in the confectioner's trade alone. Since the latter is certainly a far less essential industry than medicines, whatever conservation of sugar that may be needed beyond that conserved in family use should come from the candy business and not from the drug business. Therefore sugar and alcohol were by mutual consent unanimously eliminated from the materials to be conserved in the preparation of medicinal preparations. When it came to glycerin it was found that the amount of glycerin used in the drug trade was an appreciable percentage of the amount made and used in this country. Thereupon the representatives of the drug interests at once volunteered to undertake a study of the preparations containing glycerin with an eye to reducing the amounts of this substance used in medicinal and toilet preparations. Undoubtedly toilet preparations are less essential than medicines and undoubtedly conservation should be had in toilet preparations before medicinal preparations are changed. At this point of the hearing Doctor Alsberg entered a strong protest against changing any

medicinal formulas except as a last resort and maintained that before such a determination is reached by the Food Administration, other less essential industries using glycerin should be appealed to and requested or instructed to curtail or replace their glycerin. As the Government executive to enforce the Pure Food and Drugs Act, Doctor Alsberg stated that he would protest against changes in official formulas because he would not assume the responsibility incurred by such changes, affecting as they might the lives of our boys in the trenches fighting for us the great battle of human liberty and freedom.

Summed up, therefore, there is no occasion to conserve sugar or alcohol in medicinal preparations and there may not be in conserving glycerin; but if this association desires to do its bit in a useful and practical way, it might name a committee, perhaps called a Conservation Committee, and authorize or instruct it to work upon all official preparations as well as non-official preparations containing glycerin with an eye to reducing the amount of glycerin used in the same. This might also be extended to toilet and cosmetic preparations. There are doubtless some preparations that contain too much glycerin, or rather more than they actually must contain in order to be efficient and permanent. The Allies have recently called upon Uncle Sam for twenty million pounds of glycerin for the remaining six months of this year, which is a material increase over former estimates. Whatever they need to win this war and we can possibly supply, we must strain every nerve to supply, and therefore glycerin conservation may be demanded of us before the end of this year.

DISCUSSION.

A. R. L. DORME: I was requested by your Chairman sometime during the past year to present the result of a hearing which was given by the United States Food Commission on the question of conservation of alcohol, glycerin and sugar. Concerning these there had been much propaganda spread over the country, rather disturbing to the drug trade in general, particularly as to recommendations looking to the changing of many of our imported formulas with alternatives, given more less at haphazard, and therefore fraught with a little bit of uncertainty and risk, we thought, to the practical interests of the country. In this paper I have endeavored, in a general way, to give you the result of that conference.

J. P. SNYDER: The subject of glycerin conservation is something that I have done some work on. I have been somewhat surprised to find that glycerin did not play such an important part as a solvent as I had been led to believe. I made experiments with camphorated tincture of opium, preparing the tincture according to the U. S. P. formula; also another, leaving out glycerin. Practically the same results were obtained; the analysts checked up very closely.

I also made experiments with ipocacuanha and, according to the results of these experiments, we may conserve glycerin in some of the preparations of this drug.

H. V. ARNY: Mr. Snyder's information is along the same line of a conversation which I had with Mr. Seoville yesterday. He had been experimenting along the same line. We certainly want, as far as possible, to conserve glycerin in preparations wherein it is not essential.

CHAIRMAN R. P. FISCHER: You will recall that Doctor Dohme suggested that it might be well for the Association to appoint a Conservation Committee. Will the Section take some action thereon?

H. V. ARNY: I would move that such a committee be appointed.

A. R. L. DORME: I am very glad this action has been taken by this Section, because, if we are going to make a strong effort at Washington for the recognition of pharmacy, in which the American Pharmaceutical Association is naturally going to be prominently mentioned, our desire to cooperate with the Government in conservation will help us in our efforts to secure recognition.

You recall, some of you, that were at the meeting yesterday, that Col. Raymond, of the U. S. Army Medical Supply Bureau, gave us a very interesting talk on the pharmacists in the United States Army. While I am not endeavoring to repeat to you exactly what he said, I will say this much, that he said: "If you expect to gain recognition in the United States Army, I think you should be guided by the same methods that the dentists used. The dentists, eight years ago, were in the same condition that you are now, when I addressed their National Association as I am now addressing your National Association, and to whom I said, that if they made themselves indispensable to the Army their recognition would come, and if you make yourselves indispensable and show that your services are as important as many other services to the Army in more ways than one and in as many ways as possible, your recognition will come." It seems to me that this is one method by which we can show our services are indispensable, namely, that we are trying to conserve something that the Government needs.

CONCERNING THREE CARDINAL POINTS IN PHARMACY.*

BY B. E. PRITCHARD.

With half a century to my credit in the pursuit of Pharmacy, I trust that it may not be considered impertinent to mention a few points pertaining thereto that seems to be susceptible to improvement.

When I entered upon this long period of what has proved to be my calling in life, there was nothing of what is now most properly denominated "Prerequisite Attainments" to measure up to before one could cross the threshold of pharmacy. My only attainments consisted of several years' experience as a newsboy on the streets of Pittsburgh, and a very limited attendance at the public school in my home district. At that time the word "Drugs" over the door of a place of business did not produce any greater impression upon the public mind than did that of a grocery, hardware, dry goods, or any of the other myriad stores that lined the public thoroughfare of any town or city. The drug store was simply a store and to the passer-by did not differ from any other store except in the matter of odor, which in those days was much more pronounced than now. It was just about that period in the evolution of things when mystery was beginning to detach itself from the drug business. The globular containers of various colored liquids were still in evidence and their brilliant flashes of light illuminated an occasional corner of a street. I say "occasional" in this connection, for the reason that drug stores were not so thickly strewn as we find them in these days. The title of "Pharmacy" was but seldom given, "Apothecary Shop" being the popular synonym, then most largely in use.

But perhaps all these preliminary remarks may have no interest for you, however much they mean to me as I recall my first introduction into the practice of pharmacy. The purpose I have in mind, however, will become apparent as I proceed to show how unprepared my mind was, and how poorly equipped was my brain to assimilate the complexities and deep things that pertain to the study of pharmacy and the branches of knowledge that necessarily go hand in hand therewith. Through all the years that have gone since my first entrance upon the practice of pharmacy, my ignorance of fundamentals has constantly been "a thorn in the flesh" and has proved a serious handicap in the way of my advancement. Hence, with my own experience to guide me, I feel it my bounden duty

* Read before Section on Education and Legislation, A. Ph. A., Atlantic City meeting, 1916.

upon every opportunity that presents itself to say to any young man who contemplates taking up pharmacy as his life work, "Be sure that you have had yourself properly prepared by sufficient preliminary education to be able to grasp intelligently the problems that will confront you every day after you have taken up the duties of your calling, and solve them yourself, guided by your own knowledge." What constitutes proper knowledge and how is it obtained? Time, patience, experience and a capacity for assimilation alone can bring one to a state of *almost* perfection, but no man ever fully gets there, although he is constantly adding to his attainments. Therefore I consider the most important and essential cardinal point, and the one most worthy of emphasis, is Sufficient Preliminary Education.

"What is it to be wise?

'Tis but to know how little can be known.

To see all others faults, and feel your own."

I am convinced that thorough knowledge of the theory of pharmacy and wide instruction in all the branches of education that come in the curriculum of a good college of pharmacy are essential—and no student should be given his diploma who has not shown himself capable of reaching the passing mark—yet, unless the student has been given the opportunity to familiarize himself with these teachings by coming into actual contact with them in the presence of the customer, all these will count for naught in the making of a competent pharmacist. Practical Experience is an absolutely necessary prerequisite in order to apply the knowledge which has been gained through lectures and the study of text-books. College training alone fails to make a person a success in business life; one must come into direct contact with the actual thing itself if he would feel himself thoroughly rounded out and ready to grapple with the problems that continually arise in his vocation. With what has already been said in mind, there can be but one answer to the query—"Who should be authorized to distribute medicines of any and all character?" Those only who by careful study and conscientious attention have properly qualified themselves for that duty. To knowledge must be added practical experience. To obtain such experience requires much time and long, patient, watchful waiting upon the methods and practices employed by those who have been our preceptors, who in turn have themselves been trained by others qualified to impart the necessary knowledge.

You ask how long it would be safe to leave one's assistant alone to grapple with the exigencies of every-day life in a pharmacy. Pretty hard question to answer, isn't it? Does two years' experience in the average drug store seem a satisfactory reply to this query? That is the standard that has been set by those men who have formulated most, if not all, of the pharmacy laws of the several states. Let me quote from one of these statutes which constitutes a fair sample. "Those applying for examination for certificates as qualified assistants therein must produce evidence of having not less than two years' experience in said business." What is meant by the words "said business?" The same statute will tell us that, it reads: "All persons who desire to become pharmacists must produce satisfactory evidence of having had not less than four years' practical experience in the business of retailing, compounding or dispensing of drugs, chemicals and poisons, and of compounding physicians' prescriptions;" and, furthermore, "of

being a graduate of some reputable and properly chartered college of pharmacy;" and still further, "must produce satisfactory evidence of having had not less than two years of high school training, or pass an examination equivalent thereto." And yet, after having successfully fulfilled all these preliminary requirements, and then successfully made the required 75 percent passing mark before the pharmaceutical examining board, the pharmacist can, under the pharmacy law, leave his business temporarily in care of one who has managed to emerge safely from a pharmaceutical board examination with such meagre knowledge as he may have been able to grasp while being employed, in any capacity, in a drug store for two years. Does the absurdity of the situation dawn upon you? Apart from his being a convenience to the pharmacist, has the assistant pharmacist a recognized position of value under our pharmacy laws? Is the public amply protected under the present requirements for registration of qualified assistants? Is he qualified? Is it worth while to continue provisions for his registration? Yes, but under more amplified prerequisite requirements than those that now obtain, which are but little removed from being farcical. Have I succeeded in making it apparent that a third cardinal point in pharmacy should by all means be Intelligent Service Always?

Sufficient Education, Practical Experience, Intelligent Service—given these three cardinal points, coupled with honesty, sobriety and a clean conscience, no man can fail to make his life a success.

MORE CONSISTENT PHARMACEUTICAL STANDARDS.*

BY FREDERICK J. WULLING.

Why camouflage any longer in pharmaceutical, educational and practical standards? Camouflage is a deception in favor of self-interest and is only justified as an expediency toward a right and righteous end. It is of two sorts: affirmative and negative. The affirmative is the justifiable kind. Nature indulges in this kind when it gives arctic animals white fur and the beasts of the tropic stripes and spots to make them one with the snowdrift and the jungle, respectively. The tree toad is of the color of the bark of the tree and green insects blend with the foliage. Nature's camouflage is intended to protect and preserve life and is therefore good. This idea has been applied to modern warfare. To deceive the camera and the telescope of the aviators and observers has become one of the chief aims of the firing line. Negative camouflage is the kind that is without affirmative results. It often produces the opposite.

In failing to adopt higher educational standards, except in spots, has not pharmacy camouflaged itself negatively? Hasn't the great body pharmaceutical deceived itself in believing its present standards high enough? Ought it not derive a lesson from the fact that medicine and dentistry, so akin to pharmacy, have prospered so significantly of late because of their accelerating educational standards? Does the fact that professional pharmacy has suffered dilution and attenua-

* Read before the American Conference of Pharmaceutical Faculties and the joint session of the Section on Education and Legislation, A. Ph. A., the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties.

tion through commercial activities, make a continued passive attitude toward standards commensurate with the times and with the responsibility of pharmaceutical practice, justifiable or wise? Does the pharmacist who dispenses five prescriptions a day need to be less safe and reliable than the one who devotes his full time to professional practice? Is it defensible that the physician who treats five patients a day be less qualified than the one who attends fifty daily? May the railroad engineer who runs a train fifty miles be less able and reliable than the one who runs a train through an entire division? The pharmacist, the physician, the engineer in each case needs the fullest measure of qualification irrespective of the service each gives quantitatively in his respective field of work. With higher standards go higher aims and purposes and proportionately better service. The higher the standards of a calling, the higher is the grade of those it attracts as its practitioners and trustees. I maintain that as pharmacists we are the trustees of our calling, morally obliged to administer upon it with the highest degree of efficiency and to hand it down to the next generation in a greatly improved condition. That is the method whereby civilization grows and evolves. Development and progress go forward through and by the highest degree of efficiency and achievement of the living generation, not by the measure of the mediocre. This fact is so self-evident that it hardly needs statement and yet, as a whole, the body pharmaceutic has camouflaged itself negatively concerning it. If in the past professional ideals and forethought had been more universal among pharmacists, standards would have increased more rapidly and the insidious aggression of commercialism would not have been possible. Commercialism is right and good and just as respectable as professionalism if in its place and if recognized as such. This fact is being increasingly recognized not only by the advocates of pure pharmacy, but also by the ultra-commercialists, who probably through economic allurements have entirely banished pharmacy from their establishments, thus creating the so-called "drugless drug stores" and releasing a certain amount of professional pharmacy to others.

The firmer establishment of professional pharmacy (it is regrettable that the phrase "professional pharmacy" must be used; the word "pharmacy" ought to imply without qualification a professional activity) is evidenced in every large center of population by the increasing number of ethical pharmacies and laboratories. This transition is under way, but needs for more momentum the assistance and encouragement of higher educational and, therefore, basic standards. These standards can be achieved only by their advocates. The advocates must do more missionary and constructive work and must utilize every legitimate agency toward the desired end, otherwise forces outside of pharmacy will step in and compel proper standards as has already been done in the State of Illinois. The work must be done by individuals and by organizations. The organized avowed advocates of higher standards are the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy, named in the order of their establishment, in a happily increasing measure the National Association of Retail Druggists and many State and other associations.

Of these the National Association of Boards of Pharmacy is the most logical and powerful to bring about needed results. In the past the Boards have not,

as a whole, been conspicuous in endeavors to raise standards. Since their organization into a national body, progress is everywhere noticeable. I feel certain that Boards are made up of men whose majority want better things for pharmacy and who are open to suggestion and conviction. The Boards are the only agencies established by law with power to fix legal, educational and practical standards. The standards fixed by them taken together are too low. The mistake that the Boards have made and are making is a serious one and possibly may be construed as a dereliction of duty on part of the Boards in that they created standards largely representative of commercial pharmacy when in fact the legislatures creating them had in mind solely the regulation of the practice of professional pharmacy. Boards of pharmacy are only in the remotest degree related to commerce. No act creating any of the Boards can possibly be construed otherwise. Legislatures would be perverting their powers and functions if they intended otherwise. It is clear, beyond any possible doubt, that boards of pharmacy were created practically exclusively to fix pharmaceutical, educational and regulative standards enforceable at law and thus to regulate not commercial but professional practice. The Boards have absolutely no jurisdiction over the so-called commercial practices of pharmacists. They are powerless to enforce the law against pharmacists, except in its relation to professional practice established by statute. All this has not been sufficiently appreciated and understood, it seems to me, and hence the standards created by the Boards have been in the nature of a compromise when they should have been unequivocally based upon the ethical and professional activity of pharmacists.

The powers of the several Boards should possibly be increased in some respects by the respective legislatures, but it is my opinion that the Boards now have the power to require a four-year high school training of all applicants for licensure and that the great majority, if not all, have the power to require a college training in pharmacy. I have never heard any sufficient reasons why the Boards have not established adequate standards. Members of Boards have dogmatically expressed the opinion that the colleges should establish the standards. The fact is that whatever higher standards there are have largely been created by the colleges and against great odds, but the colleges have not and never can have legal powers to fix standards subject to enforcement by law. The Boards have this power. Some college entrance and graduation requirements are comparatively high now, but none are high enough. It is putting the cart before the horse to expect the colleges to establish enforceable standards. They are powerless to do this, and because of the great variance in the standards of the Boards the colleges do not and can not at present have uniform requirements. *The colleges necessarily are not all of the same grade, but the Boards are wholly or quite uniform in that they all possess practically the same regulative and legal powers.* Because of this it seems to me to be their duty as well as privilege, morally and educationally as well as legally, to establish uniform and adequate standards which the colleges *would be obliged to observe.* It should be particularly noted that the Boards have the power to fix standards which not only practical pharmacy must observe but also the colleges. On the other hand, colleges have no power to establish standards which the Boards would have to recognize. This clearly points to where the power to set standards lies. The National Association of Boards of Pharmacy is

the logical body through which the several Boards should be invited to do their duty more fully in this respect. Many uncomplimentary things have been said of the so-called second and third grade colleges. I am not their defender nor their advocate, but I recognize that in many cases they are the products of the prevailing conditions for which the Boards and other factors are more responsible than they. *The colleges and associations in most cases are the creations of the pharmacists, directly and indirectly, and are supposed to be and are helpful agencies primarily for the uplift of the calling. The Boards, on the other hand, are creations of the States for the benefit not of pharmacy, but of the people. They are the means whereby the States attempt to protect the people against incompetent practitioners and hence they are part of the people's self-defensive agencies. They are of those parts of the State's machinery which are charged with particular functions, for the carrying out of which they have all necessary power. Some of their particular functions are expressed in the acts creating them. While some of their powers are defined, some are inherent and implied. Under these latter the Boards can and do make reasonable rules and regulations which have the force of law. Part of these rules and regulations could consistently be made to include high school and, for the near future, college prerequisites. If this were done, it would at once put the colleges on an equality, in that respect at least, and would, among other things, do away with the unprofessional and undignified, though in a few cases justifiable, competition for students. The results would be an influx into pharmacy of a better and more uniform grade of apprentices who in due time by their superior training, intelligence and judgment, would elevate the calling to a professional and intellectual standard commensurate with the dignity and responsibility of a very important division of medicine which pharmacy really is. No fear would need to be had that the number of apprentices would decrease, because it is a fact abundantly proved by experience in medicine, dentistry, engineering, law and other learned callings, including the cases of some of the colleges of pharmacy, that increased requirements attract increasing numbers of matriculants. In the case of the College of Pharmacy of the University of Minnesota, increase of the minimum course to three years has resulted in a very perceptible increase in enrollment, contrary to the predictions of many.*

I hope I have succeeded in pointing out the underlying basic position and duties of the Boards, and that it will not be regarded as presumption on my part for having done so. I feel the Boards are under obligations which they have not, as a rule, fully recognized and fulfilled. Have they not been, possibly unconsciously, a deterrent factor when they should have been a leading one in the establishment of consistent and necessary basic standards? No more time and prestige should be lost, but prompt and energetic action should be collectively taken to make up for past remissness or indifference in the respect pointed out.

It should be said that the entire body pharmaceutic is partly, even largely, at fault in the matter because it has not been sufficiently interested and aggressive in the very element fundamental to the welfare of the profession and, therefore, fundamental to the welfare of those whom the calling serves. All organizations should encourage and rally to the support of the Boards in an effective and whole-hearted way by every proper means at their command. It would be patriotic and loyal to do this at once. The Government has practically implied that we

pharmacists as a class are not sufficiently educated and intelligent to be recognized as among the agencies qualified to be called upon to help prosecute this terrible war. Although we deny this the implication is not pleasant to contemplate. We ought forthwith to create such standards that this blot on our escutcheon would be forever removed. Talking and commiserating about the matter will not remedy the situation. A little courage and determined and united action are the remedies. The N. A. B. P. should take the initiative and all other associations should back it up energetically, forcefully and fraternally.

Possibly I should say in closing that all this is said in the most friendly spirit. We are all bound together in the bundle of life. I merely want to be helpful.

SUMMARY OF THE PROCEEDINGS OF THE 1918 MEETING OF THE
AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES
AT CHICAGO, ILLINOIS, AUGUST 12-13, 1918.

BY THEODORE J. BRADLEY, *Secretary*.

The nineteenth annual meeting of the American Conference of Pharmaceutical Faculties convened at the Congress Hotel, Chicago, on Monday, August 12, 1918, with representatives of twenty-six schools in attendance. Three sessions were held, and, in addition, a joint session with the National Association of Boards of Pharmacy.

Henry Kraemer of the University of Michigan was President of the Conference for 1917-1918 and presided at all sessions of the meeting. In his presidential address he discussed several topics of interest and importance to pharmacy and colleges of pharmacy, the most prominent of which was a strong plea for two distinct classes of drug stores, the commercial and the professional, with corresponding courses in colleges of pharmacy, one preparing for the practice of commercial pharmacy and the other for the practice of professional pharmacy. F. J. Wulling of Minnesota read a paper supporting the plea of President Kraemer for two kinds of pharmacies.

After consideration of recommendations made by President Kraemer, the Conference adopted the following resolutions:

1. That a special committee of three be appointed by the incoming president to consider and report on the question of the establishment of two distinct classes of pharmacies, namely, the commercial drug store and the professional pharmacy, this committee to work with a corresponding committee of the National Association of Boards of Pharmacy, if such a committee is appointed by that organization.
2. That a committee be appointed by the incoming president to work out methods of presenting the advantages of pharmacy as a calling to high school students of the country.
3. To continue the agitation for the standardization of degrees granted by colleges of pharmacy.

The report of Secretary-Treasurer T. J. Bradley of Massachusetts showed that the Conference now has forty-six member schools, and that the finances of the organization are in a prosperous condition, there being a balance of slightly more than a thousand dollars in the treasury, with all bills paid. On recommendation of the Secretary-Treasurer it was voted to request that the proceedings of the joint session of the Conference and the Association of Boards of Pharmacy be published in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

Chairman J. A. Koch made a report for the Executive Committee, in which it was shown that 58 percent of the new students matriculated in 1917 in the colleges of pharmacy of the country were graduates of high schools, or had an equal or better preliminary education, and that the other 42 percent of the new matriculants had completed one to three years of high school work. It was also

reported that the Carnegie Foundation has promised to give early attention to the question of the investigation and classification of pharmacy schools, in a manner similar to the investigation made of medical schools a few years ago.

The report of the Executive Committee also dealt with the question of military instruction for students in colleges of pharmacy and this subject was discussed at length. It appears possible that students will be allowed to enlist in a reserve army for military instruction, and it is to be the policy of the Government that they be not called for service, except in great emergency, until their college courses are completed, provided that their college work is of satisfactory quality.

The report of the Pharmaceutical Syllabus Committee was presented by W. C. Anderson of New York. This committee reported that the preparation of the third edition of the *Syllabus* is well under way, and the Conference voted to continue its annual contribution of twenty-five dollars towards the expenses of this Committee.

Memoirs of the services to pharmaceutical education of men who have passed away during the past year were presented as follows: J. P. Remington, by W. B. Day; Charles Caspari, Jr., by E. F. Kelly; A. B. Husted, by William Mansfield; and J. H. Long, by M. A. Miner.

Reports were received from the nine standing committees and from one special committee, including matter of much value, which will appear in the annual volume of the proceedings of the Conference.

The Conference voted to instruct its Secretary to communicate to the Surgeon General of the United States Army its belief in the erroneousness of a statement widely published and attributed to an officer in the Surgeon General's office, that there are but eight reputable and worthy schools of pharmacy in the United States.

The officers of the Conference elected and installed for the ensuing year are: *President*, Charles B. Jordan, Purdue University School of Pharmacy, Lafayette, Indiana; *Vice-President*, William Mansfield, Albany College of Pharmacy, Albany, New York; *Secretary-Treasurer*, Theodore J. Bradley, Massachusetts College of Pharmacy, Boston; *Chairman of the Executive Committee*, Julius A. Koch, Pittsburgh College of Pharmacy, Pittsburgh, Pa.

MAILING AMERICAN PHARMACEUTICAL ASSOCIATION JOURNALS TO MEN IN THE ARMY AND NAVY.

In reply to your letter of the 20th *ultimo*, with regard to the THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, I have to say that the arrangement under which unwrapped and unaddressed magazines intended for soldiers and sailors may be mailed by the public at the postage of one cent each is applicable only to such publications as constitute magazines within the ordinary meaning of that term, that is, magazines devoted to literature or containing articles of general interest, and not to newspapers or other publications devoted in the main to matter of purely local or restricted interest.

In this connection, I have to say, however, that the readers of THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, desiring to send copies thereof to soldiers and sailors stationed in the cantonments or with the American Expeditionary Forces abroad, may mail them at the transient second-class rate—one cent for each four ounces or fraction thereof—provided they are properly wrapped and addressed—the name of the particular individual, together with the designation of the unit or organization to which he belongs, and the words "American Expeditionary Forces" being placed upon wrapper of each copy or package.

Respectfully,

THIRD ASSISTANT POSTMASTER GENERAL.

SUMMARY OF THE PROCEEDINGS OF THE FIFTEENTH ANNUAL
MEETING OF THE NATIONAL ASSOCIATION OF BOARDS OF
PHARMACY AT CHICAGO, AUGUST 12-13, 1918.BY H. C. CHRISTENSEN, *Secretary*.

The Fifteenth Annual Meeting of the National Association Boards of Pharmacy held in Chicago on Monday and Tuesday, August 12 and 13 was, in point of interest, accomplishments and spirit of determination, to exert greater efforts than ever before, to make progress along the now well-recognized lines of the Association's work, the most successful ever held.

The Boards of Pharmacy of twenty-seven States were represented as follows: Alabama, Arkansas, Colorado, Connecticut, Florida, Illinois, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Missouri, Nebraska, New Jersey, New York, North Dakota, Oklahoma, South Carolina, Tennessee, Texas, Utah, Vermont, West Virginia, Wisconsin; total number of delegates and Associate delegates present, 53. Of the States represented 25 are Active member states, and two—New York and New Jersey—are "Associate" member States. Forty-four states, including the District of Columbia, are now Active member states of the N. A. B. P. and two, as before mentioned, are Associate member States. This leaves only three non-member States, namely, Rhode Island in the East and California and Wyoming in the West.

Active member states are those between which reciprocity for licentiates is in force. Associate member states take part in all the activities of the Association with the exception that, on account of state laws or other conditions, these have no general reciprocity with other member states.

Inasmuch as the official reporter of the meetings was called to Washington immediately after the final session Tuesday evening, before a transcript for a synopsis of the proceedings could be made, this report presents only such features as the secretary was able to recall, including the most important recommendations which were adopted.

The recommendations offered by President W. P. Porterfield which were adopted unanimously, show better than any other feature of the meeting the temper and unquestioned sincerity not only of the N. A. B. P. as an association, but also of the individual member Boards of Pharmacy holding membership in the Association.

Recommendation No. 1:

WHEREAS, An increasing number of states have established graduation from a recognized College of Pharmacy as a prerequisite for examination as a licensed pharmacist, and

WHEREAS, The courses offered by these schools become an all-important matter, be it

Resolved, That the N. A. B. P. take steps to establish a minimum standard for said courses upon which said recognition shall be based.

This resolution brought out considerable discussion and it was finally voted to refer it to the Executive Committee, and that Committee was instructed to confer with the Syllabus Committee in an effort to prepare a plan for recognition to be recommended to the individual member State Boards for adoption.

Recommendation No. 2:

WHEREAS, States generally require a definite amount of high school instruction or equivalent as a prerequisite for examination, be it

Resolved, That the N. A. B. P. take steps to establish a minimum requirement for each year of high school work—same to be represented by "Units" or other acceptable designation

This was referred, the same as No. 1, to be considered jointly by the N. A. B. P. Executive Committee and the Syllabus Committee, with instructions to report a plan for general adoption.

Recommendation No. 3:

WHEREAS, It is apparent that the best interests of both the public and the druggists are

served by having two classes of pharmacists generally designated as Registered Pharmacist, and Assistant; be it hereby

Recommended, That efforts be made in all States where not already provided, to establish two classes of pharmacists (Registered Pharmacist, and Assistant Registered Pharmacists).

Recommendation No. 3 was unanimously adopted and referred to the Executive Committee with instructions to place the same in the hands of the incoming legislative committee. It was brought out that legislative bodies will convene in nearly forty states the coming winter. The legislative committee will be instructed to get in touch with Boards of Pharmacy and State Association legislative committees and to assist these bodies wherever possible in securing amendments to laws in States where no provision is made for Assistant Registered Pharmacist.

Recommendation No. 4:

WHEREAS, There are, in general, two classes of pharmacists recognized by various States, designated as Registered Pharmacist and Assistant Registered Pharmacist, or otherwise; and

WHEREAS, The line of demarcation between these two groups is growing sharper; and

WHEREAS, The requirements for the Registered Pharmacist is becoming distinctly greater in scope and character than the requirements necessary for Assistant Pharmacist; be it

Resolved, That this Association recommend that separate sets of questions be prepared for these two classes, and not merely the classification be based on higher and lower percent grades made on the same set of questions.

Recommendation No. 5:

WHEREAS, It is apparent that conditions in a number of States are such as will prevent Boards of Pharmacy in these States from complying with the recommendation of the N. A. B. P., adopted in 1915, to require high school graduation (4 years) in 1920 for entrance to examinations for Registered Pharmacist; be it, therefore

Resolved, That this Association extend the high school requirement to become effective January 1, 1923.

Recommendation No. 6:

WHEREAS, The National Association Boards of Pharmacy representing as it does the legal bodies—The State Boards of Pharmacy—in the various member States which have or should have the power to fix standards and requirements for entrance to examinations before these bodies for Pharmacist, be it hereby

Resolved, That this Association go on record as recommending that all Boards of Pharmacy holding membership in this Association should require not later than January 1, 1920, that candidates for examination for Registered Pharmacist must have had at least two years satisfactorily completed high school work.

Recommendations Nos. 4, 5 and 6 were adopted.

The discussion on recommendations Nos. 5 and 6 showed clearly that, while the high school requirement was extended to 1923, corresponding to the time adopted by the Conference Schools for such requirement, many Boards, probably a majority, will require full four-year high school for entrance to examination for Registered Pharmacist before that time.

Considerable discussion was had with regard to the Edmonds bill. H. L. Meredith, chairman N. A. B. P. Committee on National Legislation, presented an interesting report on work done by his Committee in the interest of this bill. The report will be published in full in the Proceedings of the N. A. B. P. Results with regard to the advancement of this measure have so far not been satisfactory. Further efforts will be made by Mr. Meredith's Committee to obtain favorable action and, whatever the outcome, the N. A. B. P. will feel that its efforts in the interest of this bill which seeks recognition for our pharmacists in the Army in order that they may be able to render the best possible service, has been of a character that reflects much credit to this Committee and especially to Chairman Meredith.

Reports made by both the Legislative and Executive Committees showed good work accomplished.

The Chairman of the Advisory Examination Committee reported that several State Boards had been visited during the year and that a number of sets of questions had been sent in for suggestions and criticisms. He stated further that so far as was possible the Committee had complied with requests for criticism and suggestions with regard to examination papers. Also that the improvement in the character of questions used, and method of examinations showed a marked improvement.

Continuing the report stated as follows: If there is any criticism to be made specifically, it is, that a number of our members still do not give recognition in their questions, of the existence of the new ninth revision of the Pharmacopoeia. This work is a great improvement over all previous editions—embracing many new and valuable features. It should be the duty of every examining board to satisfy itself, through its examinations that applicants are fully conversant with current revisions of the U. S. P. and the N. F.

The trend of the U. S. P. toward the scientific is one of the most encouraging signs of the times for pharmacy. But, in order to profit by this progress, both schools of pharmacy and State examining bodies must take advantage of the opportunity offered to readjust their courses in pharmacy and include in the scope of State Board of Pharmacy examinations questions relating to the many new features covered by ninth revision of the Pharmacopoeia and the fourth edition of the National Formulary. The improvement, progress and readjustment necessary, is so apparent, that the urgent need of advancing to a 3-year course for Ph.G. with at least high school graduation as an entrance requirement, can not be questioned by any having the best interests of pharmacy at heart. And, when it is intimated that it is necessary for schools and colleges to adopt these advanced standards it is meant of course that boards of pharmacy must likewise prepare to require these prerequisites for entrance to examination for full Registered Pharmacist.

Some, on first thought, while granting the necessity for the advanced standards outlined in the foregoing paragraph, will hold that we should go easy on advancing standards at this time. True, the draft has taken heavy toll from the class of men composing the body of Registered Pharmacist, especially between the ages of 21 and 31. This has produced in practically all States a shortage of drug clerks. It should be acknowledged, however, that the demand is for clerks, ordinary, every day clerks, not proprietors, not managers, but just clerks. These clerks must of course have the knowledge and experience necessary to qualify them to sell and dispense medicines with safety to the public. In order to be a safe person to sell and dispense drugs, medicines and poisons to the public a clerk acts as assistant to the proprietor or manager, who should in all cases be fully registered persons, but such assistants need not necessarily be required to have the supposed high qualifications of the fully registered proprietor. The point is this: No matter how high the requirements for full registration a sufficient number of pharmacists will be forthcoming to fill the necessary need for proprietors.

It is for the reasons stated, therefore, that the present shortage of drug clerks throughout the United States has emphasized as never before the necessity for two classes of pharmacists in every state, of Registered Pharmacist, and Assistant Registered Pharmacist. A considerable number of the States now have these two classes, but in a very few States has the provision for assistants, as a source of supply of clerks been given the consideration that it deserves.

This proposition fits in well with that of raising the standards for full registration. The lower the standards for full registration the larger the supply of proprietors. But, as it is not proprietors that are needed, why not increase the qualifications required for entrance to examinations for Registered Pharmacist and thereby bring pharmacy on a par with other professions? If the present status of pharmacy, with regard to preliminary and professional training were equal to that of medicine and dentistry we would not be having the trouble that now obtains in securing recognition for pharmacy in the Army.

SIXTY-SIXTH ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, CHICAGO, ILL., AUGUST 13-17, 1918.

ABSTRACT OF THE MINUTES OF THE FIRST GENERAL SESSION.

The First General Session of the Sixty-sixth Annual Meeting of the American Pharmaceutical Association was called to order in the Gold Room of Congress Hotel, Chicago, Tuesday evening, August 13, 1918, at 8.00 P.M. by President A. R. L. Dohme. (A list of those in attendance will be found under Societies and Colleges.)

After introductory and congratulatory remarks President Dohme called on Ex-President John Uri Lloyd of Cincinnati for the invocation. In his appeal Professor Lloyd referred to those with whom he had been associated in the past, whose duties had been assumed by those present, and expressed the hope for a successful convention which implied a helpfulness for the world.

President Dohme then invited representatives of the Government to deliver their messages and extended them a welcome. Lieut. Lawrence Zempsch spoke for the Navy Department. (Lieutenant Zempsch is one of eighty-two pharmacists of commissioned rank in the Navy. His rank is that of Lieutenant Junior Grade in the Medical Department, and he is stationed at Great Lakes Naval Training Station.)

The speaker extended an invitation to the members to visit the Training Station, where 50,000 of America's finest youths are preparing for their duties. He then explained the position of pharmacists in the service and contended that educated pharmacists had advantages they would not have without such education. He stated that before the war there were twenty-three pharmacists and a chief pharmacist in the Navy. To-day there are two hundred and seventy-one actively listed; eighty-two of these, after having passed a severe competitive examination as to their pharmaceutical knowledge, and their ability as first-aid men, as sanitary inspectors, X-ray technicians, laboratory workers, etc., have been given commissions. They have been commissioned for the period of the war as temporary surgeons of the United States Navy, with the rank of Lieutenant Junior Grade and Lieutenant in line for promotion to that of Lieutenant Commander, which is equal to that of Major in the Army.

Dr. Lyman F. Kebler conveyed the greetings of the Bureau of Chemistry, U. S. Department of Agriculture. He was reminded that this was the twenty-fifth anniversary of his wedding and of his first attendance (in Chicago, 1893) at a meeting of the American Pharmaceutical Association. Another representative of the Department was C. O. Ewing of the Pharmacognosy Laboratory. He stated that while Doctor Kebler was rounding out his twenty-fifth year of attendance, this was his first, but he hoped to be present twenty-five years hence.

President Dohme in responding said in part: "On behalf of the American Pharmaceutical Association it affords me great pleasure to thank you for your interest and valued remarks. I want to assure you it is a great pleasure for us to have you with us, and to participate in our proceedings and attend our various sectional meetings.

"I do not think there is a member of this profession, anywhere in this country, who is not imbued thoroughly with the conviction that it is a part of his duty 'to do his bit' and serve his country in whatever way he can. The great trouble is that the full opportunity for so doing has not presented itself. Surely, it is not because of lack of effort on our part to offer our services and to insist upon their acceptance, if possible. We hope fervently before this war is much older that pharmacists will be in the service of their country in the position in which they can be of greatest service, namely, as pharmacists."

Vice-President Leonard A. Seltzer of Detroit then assumed the chair while President Dohme presented his address. (See August issue of the JOURNAL, p. 605, *et seq.*, also this (September) number for plan of federation.)

After the reading of the address, and on motion duly made, seconded and carried, the President's address was referred to a committee consisting of Messrs. W. C. Anderson, J. A. Koch, H. P. Hynson, T. J. Bradley and J. C. Peacock.

President Dohme then resumed the chair.

The minutes of the Council were read by Secretary J. W. England. On motion of W. C. Anderson, which was seconded by Charles H. LaWall, the minutes were approved by unanimous vote. (See Council Business.)

Secretary William B. Day then read the list of special and standing committees. The President announced that reports from the respective chairmen would be called for at the next General Session.

President Dohme appointed the following members of the Committee on Resolutions: Messrs. S. C. Henry, J. H. Beal, Jeannot Hostmann, O. F. Claus, W. C. Anderson, Clair A. Dye, J. W. England, Jacob Diner, S. L. Hilton and F. J. Wulling.

H. P. Hynson offered an amendment to the by-laws, which was received and referred to the Council. It follows:

Amend Chapter VIII, Article III, by adding:

"and if the number of members of the American Pharmaceutical Association, who are members in good standing of any State Association, shall equal twenty-five per centum of the actual number of members of such a State Association, then the reduction shall be five dollars, making the net amount to be paid three dollars."

making the amended Article read—

"Every member shall pay *in advance* to the Treasurer the sum of four dollars as annual dues, and by neglecting to pay said contribution for six successive months may be dropped from the roll of members. If the annual dues (four dollars) and the annual subscription to the JOURNAL (four dollars) be paid at one and the same time a reduction of three dollars shall be allowed, and if the number of members of the American Pharmaceutical Association who are members in good standing of any State Association shall equal twenty-five per centum of the actual number of members of such a State Association, then the reduction shall be five dollars, making the net amount to be paid three dollars."

The Chair then declared a recess for the selection of the Nominating Committee. After reconvening the following were announced as members of the Nominating Committee:

| | |
|-----------------------|------------------------------------------|
| Alabama: | W. E. Bingham. |
| Arkansas: | W. C. Hogan and Frank Schachleiter |
| District of Columbia: | L. F. Kebler and S. L. Hilton. |
| Illinois: | Wm. Gray and Otto H. Mentz. |
| Indiana: | C. B. Jordan and F. W. Meissner. |
| Iowa: | W. J. Teeters and Chas. Falkenhainer. |
| Kansas: | L. E. Sayre and Edward Dorsey. |
| Kentucky: | J. W. Gayle. |
| Maryland: | W. M. Powell and E. F. Kelly. |
| Massachusetts: | T. J. Bradley and J. G. Godding. |
| Michigan: | Henry Kraemer and George Snyder. |
| Minnesota: | H. W. Rutske and L. J. Aberwald. |
| Missouri: | Otto F. Claus and H. M. Whelpley. |
| Nebraska: | R. A. Lyman and H. L. Thompson. |
| New Jersey: | Chas. W. Holzhauer and Jeannot Hostmann. |
| New York: | Wm. Mansfield and J. P. Snyder. |
| Ohio: | Robt. W. Terry and Eugene Selzer. |
| Pennsylvania: | J. C. Peacock and Freeman P. Stroup. |
| South Carolina: | W. H. Ziegler |
| South Dakota: | F. L. Vilas and Mrs. H. R. Kenaston. |
| Tennessee: | Harry Whitehouse and E. V. Sheeley. |

| | |
|------------|------------------------------------|
| Texas: | W. H. Cousins and E. G. Eberle. |
| Vermont: | F. D. Pierce. |
| Virginia: | W. F. Rudd. |
| Wisconsin: | Edw. G. Ruenzel and E. G. Raenber. |

The President appointed the following members: Messrs. Charles H. LaWall, S. C. Henry, H. P. Hynson, F. E. Stewart, and J. W. England.

The First General Session was then adjourned.

SECOND GENERAL SESSION.

The Second General Session of the American Pharmaceutical Association was convened by President A. R. L. Dohme, Thursday, August 15, at 8.15 P.M.

The minutes of the First General Session were read and approved. (See preceding minutes.)

The minutes of the fourth and fifth sessions of the Council were then separately read by Secretary J. W. England and after a motion of L. E. Sayre and a second by Otto F. Claus the Association voted to approve the minutes. (See Council Business.)

Secretary William B. Day read communications from Mrs. Fletcher Howard, president of the Ladies' Auxiliary of the California State Druggists' Association, and one from Mrs. Emma Gary Wallace, corresponding secretary of the Women's Organization of the National Association of Retail Druggists. Both conveyed greetings and wishes for a successful meeting. The messages were accepted with due recognition by the Association.

President Dohme laid a letter before the Association from a gentleman in France in which the suggestion is made that a fund be raised for aiding French pharmacists. President Dohme stated that the proposed plan had the approval of the French Ambassador. The letter follows:

PROPOSAL OF ESTABLISHMENT OF A FUNDING LOAN FOR THE USE OF PHARMACISTS IN THE DEVASTATED REGIONS OF FRANCE AND BELGIUM WHO ARE DESIROUS OF RECOMMENCING BUSINESS WITHOUT DELAY.

As a consequence of the invasion and of the battles which have taken place in the north and the east of France, as well as in Belgium, nearly all the pharmacists there have had to leave their stores and frequently all their earthly possessions. Since then they have supported their families by undertaking the management of other stores or by helping their more fortunate colleagues, but in view of the length of the war they must take the future into consideration and taking into account the great difficulties which will have to be overcome in order to establish and run a business in the sections that are absolutely ruined, they are considering the advisability of buying now a small store in some other part of France, even if they may have to sell it again later, or when their presence in their native towns will be needed.

In the countries which have been the scene of these long battles nothing exists now. The corporations which have undertaken the reconstruction of these countries are in great doubt concerning their future (we, who are intimately associated with this work, know how true this is); some years must pass before it will be possible to reinstate a pharmacy in those regions where life will have to be recommenced, where it will be needful to act as in colonization, and where a drug store, however useful, is scarcely that which is of first importance in a new colony.

Ought we to abandon these pharmacists, who have had to contend with such difficulties for the past four years? Must we let them wait many years more until it be possible for them to return to their native towns? To reply to these questions it will suffice to quote the following letter from one of our colleagues of the Somme, who in the fall of 1917 was able to return to his city:

"My re-installation is very difficult and must be only partial in consequence of the obstacles I encounter in finding the goods and materials, all costing fearfully dear. Life is hard here; no bedding, other than the camp sacking, tiring and cold, especially for children. Food of all kinds costs twice as much as in Paris, frequently even more. Those who have returned—

poor souls—ought to be millionaires, which is far from being the case. The rare workmen who are to be found here ask 2 francs an hour, and they are not to be had when they are wanted. The houses which have not been demolished have neither doors nor windows, which are replaced by sacking. The walls, pierced here and there, show the traces of the passage of the shells and threatening winter will soon be on us.”

These lines do not need comment, but to complete the sad picture, and as a sequel to the first one, our colleague wrote us as follows on the 30th of March:

“After a tiresome and perilous journey I have at last reached Rouen; all my work of the last 8 months has been destroyed.” Then follows a pressing appeal for a position as manager. This colleague used to occupy a good position before the war; he is now 60 years old, with a large family.

On the other hand, if it be considered that a great many drug stores are at present being offered for sale in France, and that it would be doing a good action towards our colleagues who wish to sell, and to their families, in aiding in the sale of their stores, it will not be difficult to find a solution of the question.

On one side many want to sell; on the other side, there are many desirous of buying, but they can only do so under onerous conditions; one of them would have had to pay 20 per cent for the aid received. By establishing a funding loan under reasonable conditions, help will be given to two different classes of interesting people. It is necessary that no time be lost, and if something really good is to be done it has to be done *now*.

Our colleagues of the invaded provinces have suffered and have aged with their misfortunes; so that they do not die in misery they ask not to have to wait until after the war to make themselves a new home. They wish to find the means of securing a loan for the amount needed for their prompt re-establishment. As guaranty they could offer (1) a mortgage on the store they would purchase, (2) a cession of their right to an indemnity for damage done by the war, which they will most certainly receive.

We are of the opinion that the amount of money needed for this undertaking will not be immense; the borrowers will be able to repay the advances with some speed, the amount to be repaid not being very heavy, as for cash payments the sellers can not ask very much. Supposing that the amount be 5,000 or 10,000 francs, and that, say, 50 pharmacists avail themselves of the facilities during the first year; that would imply a capital of from 250,000 to 500,000 francs or, say, \$100,000. We think that being known, the generosity which animates all America towards their less fortunate brethren in France and Belgium will make it a comparatively easy task to find 5,000 pharmacists in the United States who would subscribe \$20.00 each to help their colleagues in distress. We do not ask for this sum as a gift, but merely as a loan, on which we will gladly pay the interest until the capital—by degrees—be returned.

Jacob Diner in discussing the proposition referred back to a somewhat similar action which was taken after the San Francisco earthquake and stated that it was his understanding that all the money loaned to pharmacists was fully repaid. He spoke of this proposal as worthy of the Association's interest and moved the appointment of a committee to devise ways and means for carrying the suggestion into effect.

L. E. Sayre seconded the motion, S. E. Ewing moved to amend and apply the move to all distressed pharmacists in the war zone. This motion was seconded by Samuel L. Antonow. The mover of the first motion accepted of the amendment and the President called for a vote which was unanimously favorable to the proposition. The appointment of the committee was left to the Chairman.

The report of the General Secretary was read and approved. (To be printed.) The report of the Committee on Nominations was called for. It follows:

REPORT OF COMMITTEE ON NOMINATIONS.

To the President, Officers and Members of the American Pharmaceutical Association:

Your Committee on Nominations takes pleasure in presenting to you this report. The Committee has held two meetings. After we adjourned the first session, Dr. H. V. Army, who had been nominated for the presidency, placed in the chairman's hands a letter declining the

honor. The Committee was therefore reconvened and Doctor Arny's declination was accepted with regrets, and the vacancy accordingly filled. The names we have to submit are:

For President: L. E. Sayre, Kansas; L. A. Seltzer, Michigan; and E. N. Gathercoal, Illinois

For First Vice-President: T. J. Bradley, Massachusetts; A. H. Clark, Illinois; and W. H. Rudder, Indiana.

For Second Vice-President: Harry Whitehouse, Tennessee; John Culley, Utah; and Zada M. Cooper, Iowa

For Third Vice-President: Jacob Diner, New York; E. F. Cook, Pennsylvania; Adolph Emenhofer, Illinois.

For Members of the Council: J. H. Beal, New York; R. A. Lyman, Nebraska; E. H. Thiesing, Ohio; S. L. Hilton, District of Columbia; William Mansfield, New York; C. H. LaWall, Pennsylvania; H. B. Mason, Michigan; W. J. Teeters, Iowa; and C. M. Snow, Illinois.

Respectfully submitted,

S. C. HENRY, *Chairman.*

S. L. HILTON, *Secretary.*

The report of the Committee was accepted and the names presented were declared the nominees to be voted on for the election of officers for 1919-1920.

Treasurer H. M. Whelpley made a verbal report and explained that the books and other records of the Treasurer had been audited. (The report was printed in the May issue of the JOURNAL, p. 474.)

He stated that while the funds of the Association amounted to \$86,038.69 there was some difficulty in meeting the Association expenses from the annual receipts and he urged an increase of the membership.

The report of the Committee on International Pharmaceutical Nomenclature was called for, but no report was made.

The report of the Committee on Compulsory Health Insurance was read and referred for publication. (To be printed.)

No report was made by the Committee on National Legislation.

The Committee on the President's Address reported as follows:

REPORT OF THE COMMITTEE ON THE PRESIDENT'S ADDRESS.

To the Officers and Members of the American Pharmaceutical Association:

Your Committee has given careful consideration to the address of President Dohme, and while the author makes no definite proposals or recommendations, a sense of appreciation of the careful thought given to the preparation of the paper, the evident unselfish interest of the author and the essentially constructive spirit pervading the address, led the Committee to call attention to its leading features. All of the parts of the address that so earnestly and hopefully refer to the federation of pan-pharmacy are commendatorily referred to all those committees, conferences and divisions of the Association that have to do with this great effort.

The President is congratulated upon the progress made toward federation due to his enthusiasm and constructive effort.

Your Committee suggests that the remarks of the President under the sub-heading "Pharmacy Corps in the Army" be referred to the Association's delegates to the National Drug Trade Conference.

With the same object in view, that is, the proper distribution of the President's remarks, we suggest that those referring to the "Funds of the A. Ph. A." be called to the attention of the Standing Committee on Invested Savings and Trust Funds.

It is requested that the General Secretary of the Association send separate copies of the other sections of the President's address to the chief officer of the division or to the chairman of the committee who has the particular subject in hand, for consideration. They are, respectively, as follows:

"Presentation of Papers at Section Meetings." To the chairmen of the several Sections.

"U. S. P. Revision." To the chairman of the Committee on the Revision of the U. S. P.

"House of Delegates." To the chairman of that body.

"Pharmaceutical Education." To the chairman of the Section on Education and Legislation.

"Time of Meeting:" To the chairman of the Committee on Time and Place of Meeting.

The remarks of the President on the publication of the annual proceedings, specifically, are called to the attention of the Association with the recommendation of this Committee that the Committee on Publication consider the propriety and advisability of holding the plates of the proceedings used in the JOURNAL, and including this matter in the Year Book when it is published.

Respectfully submitted,

HENRY P. HYNSON,
W. C. ANDERSON,
J. A. KOCH,
T. J. BRADLEY,
J. C. PEACOCK.

The report was unanimously adopted by vote of the Association.

Chairman J. W. England of the Committee on Revision of the Constitution and By-Laws presented several proposed amendments, necessitated by action of the Association and House of Delegates. They were read and in accordance with the rules laid over for action at the next General session. (For report see minutes of Final General Session.)

The report of the Committee on Physiological Testing was read and referred for publication. (To be printed.)

The report of the Committee on the Status of Pharmacists in the Government Service was presented by Chairman S. L. Hilton. He enlarged upon the report and after discussion it was moved by William Mansfield and seconded by L. E. Sayre that the report with Chairman Hilton's remarks thereon be printed in the September issue of the JOURNAL and that 5000 reprints be made thereof. The motion carried unanimously. (Printed in this number of the JOURNAL.)

Chairman Theodore J. Bradley presented the report of the Syllabus Committee. It was recommended that the Council provide the annual contribution of twenty-five dollars. (Report to be printed.)

H. V. Army on behalf of the Committee on Weights and Measures moved that the Council be requested to provide for the annual membership fee in the American Metric Association. The motion was seconded and carried.

Chairman F. H. Freericks moved that the report of the Committee on Model Pharmacy Law be made before the Joint Session of the Section on Education and Legislation, the A. C. P. F. and N. A. B. P. It was so ordered.

A letter from William R. White of Nashville was read by Secretary Day in which he expressed the hope for a discussion of the best means for supplying pharmacists in the Service with pharmaceutical publications. After discussion it was the consensus of opinion that the best way would be for each member to send such publications to individual pharmacists, and that thereby the best service would be rendered. It was advised that this should be made known to all members and their coöperation solicited.

The report of Chairman John F. Hancock of the William Procter, Jr., Monument Fund was accompanied by a letter conveying greetings and expressing his regrets because of enforced absence. The report follows:

REPORT OF COMMITTEE ON WILLIAM PROCTER, JR., MONUMENT FUND.

In 1904, the American Pharmaceutical Association, at its Annual Meeting, adopted a resolution to appoint a committee to collect money for a proposed monument to the father of American Pharmacy, Prof. Wm. Procter, Jr., which monument of bronze was to be placed in the public grounds of the National Capitol.

Since that time the Committee on the Wm. Procter, Jr., Monument Fund has reported the results of its labors at each annual meeting of this Association and it was expected that this monument would be erected and formally transferred to the Government during the Centennial year of Procter's birth, at which time the Association would hold its Annual Meeting in Washington, D. C., to dignify the services of its unveiling.

Your Committee feels that the monument would have been completed in time for the Anniversary had it not been for the disturbed conditions of our National affairs. Congress, however, is so busy with war propositions that it will not give its consideration to minor matters but when peace returns we feel assured that the site and design for the monument will be approved.

The money collected has been conserved by the Association, and the Treasurer will report present conditions and the amount that is in his hands.

J. F. HANCOCK, *Chairman*.

The report was referred for publication.

The report of the Committee on Horticultural Nomenclature was read by Secretary Day. The report was received with thanks of the Association and the matter of financial contribution referred to the Council. (To be printed.)

The report of the Committee on Time and Place was read and after some discussion adopted. The difference of opinion was solely on the question of whether the Association should instruct not to hold the annual meeting in July or August. The vote finally declared was that due consideration should be given, if possible, to the President's recommendation of not holding the annual conventions in July or August. New York City was unanimously chosen for the 1919 meeting; the report follows:

REPORT OF THE COMMITTEE ON TIME AND PLACE.

Your Committee on Time and Place begs to report that four cities have tendered invitations to the Association to meet with them in 1919—Asbury Park, N. J., Buffalo, N. Y., Columbus, Ohio, and New York City. The Asbury Park invitation is signed by the Director of Publicity of the Board of Commissioners. The Buffalo invitation comes from the President of the Chamber of Commerce and from the Mayor. The Columbus invitation bears the signature of the Manager of the Convention and Publicity Association. The New York City invitation comes from The Merchants' Association of New York and from the New York Branch of the American Pharmaceutical Association.

It would seem the part of wisdom to hold the meeting next year at a point easy of access to the largest portion of our membership. Particularly will this be the case if conditions of to-day prevail at that time. The Committee is of one mind in recommending that you accept the invitation of the New York Branch and hold the 1919 meeting in New York City, the time to be determined upon by the Council.

T. J. BRADLEY,
S. L. HILTON,
EDW. SPEASE,
CLYDE M. SNOW, *Chairman*.

Chairman L. F. Kebler reported verbally for the Committee on the U. S. Pharmacopoeia. This report is to be presented in writing and was referred for publication.

Owing to the decease of Chairman A. B. Husted there was no report from the Committee on Closer Affiliation of Pharmacists and Physicians.

The Committee on Organization of Local Branches made no report. The report of the Delegates to the National Wholesale Druggists' Association was read and referred for publication. (To be printed.)

S. L. Hilton called attention to the vacancy in the Council, caused by the death of President Charles Holzhauser and nominated President A. R. L. Dohme.

The nomination was seconded by William Mansfield. There were no further nominations and Secretary Day called for a vote whereby the nominee was unanimously elected. President Dohme thanked the members for this expression of their confidence. The Second General Session was then adjourned.

(The transcript of the Third General Session has not come into the hands of the Editor. It will be printed in the October number of the JOURNAL.)

FEDERATED PHARMACEUTICAL ASSOCIATION, A. Ph. A.*

| | | |
|-----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|------------------------------------|
| House of Delegates elected by the State Pharmaceutical Associations, each of which is to be represented in the House by three delegates | National Drug Conference elected by the several National Drug Associations | Executive Council |
| | N. A. R. D., 3 members | President House of Delegates |
| | N. W. D. A., 3 members | President National Drug Conference |
| | A. D. M. A., 3 members | Executive Secretary |
| | N. A. B. P., 3 members | |
| | A. C. of P. F., 3 members | |
| | A. A. of Ph. C., 3 members | |
| | P. A. of A., 3 members | |
| | U. S. Government, 3 members | |
| | A. Ph. A. delegates-at-large, 3 members | |

House of Delegates is to consider all the business coming before the federated association and to be made up of three delegates duly elected by each State Pharmaceutical Association in this country, the delegates must be members of the federated association or A. Ph. A., which includes membership in the State Association. The House of Delegates is to be attended also by individual members of the federated association, who are not members of any State Association or are not delegates, but although they may discuss the questions before that house, they shall have no vote, only duly appointed delegates possessing this privilege. The House of Delegates shall elect its own officers, who shall be the officers of the federated association or A. Ph. A., and shall consist of a president, three vice-presidents, secretary and treasurer.

National Drug Conference is to consider such business as shall come before it from the House of Delegates or from its own members, which shall consist of three delegates duly appointed by each national association and the U. S. Government constituting it. It shall determine the qualification of its own members and its actions shall not be subject to review by any other agency. The Government delegates shall be one each from the Departments of the Treasury, Navy and Army. The A. Ph. A. should name three delegates-at-large to represent it in the Conference. If later the federated association becomes the A. Ph. A. then these delegates should be discontinued.

Executive Council.—This is the executive committee of the Association and shall consist of the President of the House of Delegates, the President of the Conference and an executive secretary duly elected by the Conference, who shall also be secretary of the Conference. He shall be paid a good salary and shall devote all his time to his work, which shall be done at the central offices of the Association, located at Washington or Chicago, where shall also be located the laboratories of the Association.

Service.—There shall be instituted a series of services for the members of the Federated Association which shall be carried on in the offices and laboratories of the same under the direction of the Executive Council, who shall also have control of the funds of the Association and its publications. These services shall consist of:

* Presenting Ex-President A. R. L. Dohme's views and based upon conclusions reached at the Chicago meeting, A. Ph. A.

- a* Bureau of Chemistry and Pharmacy—where tests and assays of any products or substances shall be made for any member and an opinion given upon their compliance with laws if the member for whom it is done so desires.
- b* Bureau of Laws and Accounting—where legal advice, trade marks, patents, costs systems and analysis, etc., shall be available for members.
- c* Bureau of Exchange of Unsalable Goods—where members may exchange their unsalable goods for salable goods and thus reduce their overhead expenses. This might be extended later to a stock of rarer and costlier items not usually carried by pharmacists but available in an emergency to members.
- d* Bureau of Employment—where records should be kept of employees and employers, as well as employers could apply to secure assistance and be brought together.
- e* Bureau of Publicity—where under direction of a competent publicity man the central offices shall enter upon a systematic campaign of publicity in the public press and magazines of the entire country so as to make known to the public and our legislators the real value and services of the pharmacists of the United States.

Membership.—Membership in the federated association should be made Five Dollars, which would also include membership in the State Association, and in the Conference. Each national association should remit to the federated association this amount of five dollars for each of its members. In return for this each member is to receive the services of the Association and its publications. It is estimated that there are 28,000 members of state associations to which should be added the possible 7,500 members that would result from remittance dues from national associations. From both there should result about 25,000 members, which would give the association an income that would enable it to give service and publications to its members that would more than justify membership in it and through federation give pharmacy a weight and influence which would be helpful in legislation and publicity in many ways.

COMMITTEE REPORTS

REPORT OF THE COMMITTEE ON FEDERATION OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

In accordance with a recommendation made last year in the address of President F. J. Wulling, and approved at a general session of the Association, President Dohme on January 22nd appointed the following as members of a Committee on Federation: H. V. Army, C. E. Caspari, C. H. LaWall, W. A. Hoyer, F. J. Wulling, J. H. Beal, J. U. Lloyd, S. C. Henry, A. R. L. Dohme, and W. B. Day.

The Committee was immediately organized by correspondence and since then four bulletins have been issued in which the basic principles of the federation of American pharmaceutical bodies were discussed. During the same time, largely through the energetic efforts of President Dohme, other National and State pharmaceutical organizations became interested in the plan of federation.

The discussion by correspondence showed that a satisfactory solution of the problems before us could be secured only by meeting of the Committee, alone and with representatives of other organizations likely to be included in the plan of federation.

Such meeting was held in Chicago on August 10th, on the morning of which day eight of the ten members of the Committee met and informally discussed federation and passed a motion reaffirming the principles of federation enunciated in the address of President Wulling last year.

In the afternoon, a conference, at which the Committee met with the representatives of National drug bodies, brought the results outlined hereafter. At this conference, H. V. Army presided, while W. B. Day acted as secretary, and on roll call the following delegates were found to be present:

From the National Association of Boards of Pharmacy: H. C. Christensen.

From the American Conference of Pharmaceutical Faculties: T. J. Bradley, R. A. Lyman and Edward Kremers.

From the American Drug Manufacturers' Association: C. J. Lynn, R. C. Stofer and C. M. Woodruff.

From the Proprietary Association of America: F. A. Blair, E. F. Kemp and Z. O. Patten.

From the National Association of Retail Druggists: W. H. Cousins and S. C. Henry.

From the American Association of Pharmaceutical Chemists: C. H. Searles and W. S. Burdick.

From the American Pharmaceutical Association (Federation Committee): H. V. Army, C. E. Caspari, C. H. LaWall, F. J. Wulling, J. H. Beal, J. U. Lloyd, A. R. L. Dohme, S. C. Henry and W. B. Day.

In addition to the foregoing delegates, H. M. Whelpley, H. P. Hynson and M. A. Mandabach were present, as guests, and were given the privilege of the floor.

The National Wholesale Druggists' Association selected a delegation consisting of J. W. Morrisson, Francis Keeling, Jr., and Paul Schuh, none of whom were present at the conference.

After a general discussion of federation, the following resolution was submitted by C. J. Lynn:

WHEREAS, The experience of the last fifty years and more has demonstrated that one national organization has not adequately cared for the various interests of the several branches of American Pharmacy, which experience is the underlying reason for the organization of the several independent national associations now existing, which have heretofore most effectively represented their respective interests; and

WHEREAS, Many of the delegates here present are without power to bind their respective organizations to any plan of federation; therefore be it

Resolved, That it is the sense of this informal meeting that a merger of such organizations in a larger federation at this time is not practical; and be it further

Resolved, That having in the National Drug Trade Conference, an organization which has already accomplished much good for the common interests of the several associations here represented, it should be the aim and purpose of these bodies to further develop the conference so that it may be still more efficient in promoting the general welfare of scientific and commercial pharmacy, in which we are all concerned.

That resolution was put to a vote and was approved, Messrs. Wulling, Dohme, Caspari and Lyman asking to be recorded as voting against it.

There was then passed a motion that a conference of delegates from organizations invited to the 1918 meeting, be held on the Saturday prior to the 1919 meeting of the American Pharmaceutical Association, and that a committee consisting of one representative from each National drug body be chosen as a committee on arrangements for the 1919 conference. This motion carried and the chair selected the following Committee: J. W. Morrisson (N. W. D. A.), H. C. Christensen (N. A. B. P.), T. J. Bradley (A. C. P. F.), C. J. Lynn (A. D. M. A.), F. A. Blair (P. A. A.), W. H. Cousins (N. A. R. D.), C. H. Searle (A. A. P. C.), and H. V. Army (A. Ph. A.)

On Monday, August 12th, the Federation Committee met again for a final discussion of the problems entrusted to it, notably those questions relating to the House of Delegates and the federation of State pharmaceutical associations, that is being accomplished through the work of the House.

At this meeting the following recommendations were adopted and are transmitted to the House and to the General Session of the Association for final action.

1. *Resolved*, That it is the sense of the Federation Committee that the By-laws of the House of Delegates should be so amended that all delegates to the House shall be members of the A. Ph. A. at the time they serve.

2. *Resolved*, That it is the sense of the Federation Committee that the continuation and strengthening of the House of Delegates and the active exercise of its functions present a great opportunity for the furtherance of the federation of pharmaceutical organizations for the better coordination of the efforts of such organizations in national and State affairs and for the proper development and evolution of pharmacy.

A third resolution (given hereafter) is based upon the fact that last year Chairman J. H. Beal, of the House of Delegates, proposed five additions to the functions of the House, as follows:

(A) Transfer the reception of fraternal delegates from other pharmaceutical and allied organizations or from departments of the United States Government from the General Sessions to the sessions of the House of Delegates.

(B) Abolish the Committee on Resolutions provided for in Articles I and IX, Chapter X, of the By-laws and transfer its functions to a similar committee of the House of Delegates.

(C) Instruct the Committees on the United States Pharmacopoeia and on the National Formulary to report to The House of Delegates in addition to the reports which they present elsewhere.

(D) Make it the duty of the Committee on Patents and Trade-marks to report to the House of Delegates as well as to the General Sessions.

(E) Transfer the reports of The Commission on Proprietary Medicines (except upon financial matters and upon the election of members) from the Council to The House of Delegates.

The first of the above recommendations was adopted at the Third General Session of The Association last year; the second recommendation was referred to the Committee on Constitution and By-laws, which has not yet reported thereon; the third, fourth and fifth recommendations were laid on the table.

Your Federation Committee gave this matter its careful attention, and believing that all of the five recommendations are of vital importance to the development of the House of Delegates, submits the following:

3. *Resolved*, That the recommendations made last year by Chairman Beal, of the House, should be adopted.

A final recommendation made by your Committee is:

4. *Resolved*, That the Committee on Federation be continued for another year.

In conclusion, your Committee begs, in summarizing its work, to say that as in all great undertakings, the work accomplished by it during the past year is not as great as was desired by some of its members. It has, however, made one great step toward federation by starting a movement toward the enlargement of the scope of the Drug Trade Conference, by which it is hoped that a broad federation of national drug organizations will be secured. It will make another advance if the plan of federation of State associations in the House of Delegates is strengthened by the adoption of the resolutions submitted above. These two basic purposes accomplished, the Conference and the House will be as two piers of a great bridge and when as years go on there is completed between the two a connecting span in the shape of service features so vitally needed by American pharmacy, the federation idea will then be a realized dream.

REPORT OF THE COMMITTEE ON THE STATUS OF PHARMACISTS IN THE GOVERNMENT SERVICE.

To the President and Members of the American Pharmaceutical Association:

Your Committee on the Status of Pharmacists in the Government Service has confined its efforts of the past year to obtain Congressional legislation for the establishment of a Pharmaceutical Corps in the U. S. Army. We believed it was our duty to concentrate our work on a single proposition, that contemplated a real war service for the men fighting for the country, by placing the dispensing of medicines in the hands of trained pharmacists, instead of, as at present, largely in those untrained. The enactment of such a measure would also advance the professional standing of pharmacy.

The results I am able to report are far from satisfactory, but the outlook is not hopeless. I believe that we have a fighting chance—but we must fight and fight continuously.

From the outset, your Committee recognized that the work before it was difficult and the progress must be slow, especially in view of the opposition of the Surgeon General. We,

however, succeeded in securing a hearing on March 19, 1918, before the Committee on Military Affairs, and, we believe, corrected many wrong impressions in the minds of the members of the Committee. The report of the hearing on H. R. 5531 has been generally distributed and widely read.

We deemed it advisable to learn the actual conditions existing with reference to the dispensing of medicines in the Army camps, so that we could present the facts at the proper time. We prepared a questionnaire and forwarded same through the office of the JOURNAL to the secretaries of the Boards of Pharmacy, requesting them to obtain, at first hand, the desired information. Responses were quite promptly received from twenty-six states and presented conditions that were as we anticipated, namely, the dispensing of medicines was often done by others than graduate pharmacists and sometimes those who had been bartenders, salesmen, bookkeepers and others, without any knowledge of drugs, were in charge of dispensaries, while pharmacists under them as privates could do no dispensing except under the direction of such non-commissioned officers. All of the data obtained were tabulated and presented to the Committee on Military Affairs, and became part of the record.

With the assistance of Congressman Edmonds, the National Pharmaceutical Service Association, as well as your Chairman, used every reasonable means to obtain a hearing on the Edmonds bill before the Committee on Military Affairs. Important matters pertaining to the Army, and the Army Appropriation Bill, occupied the undivided attention of the Committee until the middle of March, when a date was set and the hearing held March 19, 1918.

The National Pharmaceutical Service Association sent out a call for a conference to be held at Baltimore the day prior to the hearing. Fifty-one delegates were present, representing nearly one hundred colleges, national associations, State and local associations, and the afternoon was devoted to discussing plans for the presentation of our case at the hearing before the Committee on the following day.

Your chairman was called upon to preside, and Mr. R. P. Fischelis was elected secretary. After a general discussion it was decided that a committee be appointed to select the speakers to present arguments to the Committee on Military Affairs. After careful deliberation, the following gentlemen were selected: Prof. F. J. Wulling, the main speaker, was to cover the entire subject in a concise form. If time permitted, the following gentlemen would discuss the following special topics: Dr. J. Madison Taylor, "The Need of a Pharmaceutical Corps in the U. S. Army, from a Medical Point of View." E. G. Eberle, "The Need of the Same Protection as far as Pharmaceutical Service Is Concerned in the Army, as Provided by State Laws in Civil Life." Caswell A. Mayo, "Pharmaceutical Army Corps in Foreign Countries." S. C. Henry, "What the Edmonds Bill Is and What It Stands For." Prof. Charles Caspari, "What Pharmacy Has Done in the Compilation of Standards for Drugs and Medicines." W. L. Crounse, representing the National Wholesale Druggists' Association, "A Refutation of the Charge Made that Manufacturing Pharmacists Objected to the Formation of a Pharmaceutical Corps in the U. S. Army."

All branches of pharmacy were represented at the conference and the hearing of next day. The conference was exceedingly harmonious, every one present being desirous to do his bit. The following day we met at the office of Mr. Edmonds; additional delegates who were unable to attend the meeting of the previous day were present, so that about seventy to seventy-five delegates attended the hearing.

Mr. Edmonds opened the hearing with a brief statement and introduced the speakers. The program was fully carried out, much interest being shown and many questions asked by members of the Committee. It was the opinion of those present that a very favorable impression was made on the Committee. The Committee, however, has done nothing with respect to considering or reporting its conclusions and from what I am able to learn the bill may not be further considered or reported at this session. Mr. Edmonds has asked that a hearing be granted him and other members of Congress that have committed themselves to this legislation: as yet, no time has been set by the Committee and there is some doubt if they will be heard at this session of Congress. It is evident, if anything is to be accomplished, that the opposition of the Surgeon General must be overcome. How this can be consummated is problematic and difficult to predict at this time. Surgeon General Gorgas retires this Fall; who his successor will be and what his attitude is can not be predicted. We feel that now is the time when all drug industries must coöperate in a united endeavor in support of this measure. The future of pharmacy largely

depends upon taking this step. The medical, dental and chemical professions are listened to and usually obtain what they desire. This is best illustrated by the formation of the Chemical Warfare Service, by executive order, and similar action could have been had for pharmacy, at least for the period of the war, if the pharmaceutical profession had been fully and as well organized as the other professions.

Close contact with men of authority in the medical departments usually elicits the information that the pharmacists are not wanted, they know too much, that they want men without pharmaceutical training, so that they can train them as they desire. The younger men in the medical service want the pharmacists, but they have not the power to overcome the opposition and, as a result, our soldiers are not getting the best pharmaceutical service obtainable and thousands of trained pharmacists are working in the trenches and along other lines different from those they are best fitted for by training and education. This lack of coordination is not only detrimental to the Army but is wasteful of an important and national asset.

In closing, we want to urge that the American Pharmaceutical Association take the initiative and call on all drug organizations to take an active part and to use its utmost endeavor to convince the Surgeon General and Secretary of War of the urgent necessity for establishing a Pharmaceutical Corps, thereby eliminating the necessity for the large number of physicians that is now being called for and which will, beyond all question of doubt, work a hardship on those remaining at home and, that the men in the Army will get better pharmaceutical service than they are receiving at present.

We urge that every member of these pharmaceutical associations work with their Congressmen, pointing out the conditions now existing, show the necessity for such a Corps and demand legislation providing for a Pharmaceutical Corps along the lines that have been worked out and proven most satisfactory in foreign armies.

Respectfully submitted,

S. L. HILTON, *Chairman.*

SUPPLEMENTARY REMARKS BY CHAIRMAN S. L. HILTON.

S. L. HILTON: I want to make a few remarks supplementing my report as chairman. I listened to an able paper by Dr. F. W. Shepardson, of the Education Department of the State of Illinois, before the Section on Education and Legislation to-day. He contended that the Department recognized the situation in the drug business, that the commercial element far exceeds the educational or professional. He inferred that this had much to do with the difficulties in securing recognition for pharmacy by the establishment of a Pharmaceutical Corps in the U. S. Army. Doctor Shepardson is right. He presents the attitude of the Government correctly and the conditions in the drug business have made it difficult to impress the desires of those working for the establishment of a Pharmaceutical Corps, that we are not demanding a commission for every corner druggist, but contending for a Pharmaceutical Corps to be composed of trained pharmacists, and every one acquainted with American pharmacy knows that we have them. If others want to enlist that is their privilege, and if by study and perseverance they attain to the proper standard and pass the provided examination, they should have the opportunity. But the proposal is for the admission and advancement of educated pharmacists.

The idea is quite general, and also with Government officials, that all licensed pharmacists, regardless of qualification, should be commissioned in such a corps. Congressmen have expressed themselves that they would favor the bill for a pharmaceutical corps provided every licensed pharmacist would be entitled to a commission.

That is not what we are working for nor endeavoring to secure legislation for. If that is the object then we had better stop our efforts right now—the aim is to have a Pharmaceutical Corps composed of men qualified in pharmacy by education and training, men who are competent to render pharmaceutical service.

The statements made by Mr. Hilton received the unanimous support of the convention.

REPORT OF COMMITTEE ON QUALITY OF MEDICINAL PRODUCTS.
AMERICAN PHARMACEUTICAL ASSOCIATION.*

The report of this Committee embraces a condensed statement of the quality of such finished medicinal products made by manufacturing and retail pharmacists and of the various ingredients and materials used, that have been brought to our attention during the current Association year.

When we consider that a slight variation from standard and an unconscious error in the wording of a label are tabulated as infringements of law, it is surprising that the record is as favorable as it is. Individual opinion seems to dictate standards in many cases of complaint for improper wording of labels. There is little wilful effort to substitute, yet the continued high range of prices offers a temptation that a few are unable to resist. Many reported instances are the result of carelessness rather than purpose. One State Board reports 27% of 371 samples adulterated; 18% consisted of deteriorated spirit of nitrous ether, 7% of camphorated oil deficient in camphor and 2% of spirit of anise, spirit of peppermint and tincture of iodine below standard. Of 1685 samples 20% were defective and consisted principally of the above-named products.

In the case of the spirit of anise, spirit of peppermint and liniment of camphor, their being sub-standard is the result of negligence, while the spirit of nitrous ether may have been carefully made but carelessly stored. Prof. Herman C. Lythgoe, Director and Analyst of the Massachusetts State Board of Health, has published a chart showing the comparative permanence of this product stored in full bottles in a cool place and the very rapid impairment stored in flint bottles exposed to sunlight. In the latter case the product was entirely worthless after the lapse of 82 days. Dr. Hodgson, in the *Pharmaceutical Journal* shows entire decomposition in 15 days stored in an open bottle, while the same product in a full, well-stoppered bottle lost only 4% in one month and about 30% in 3 months.

The condition of the market has led to the suggestion of numerous substitutes to favor conservation and reduce cost. Glucose and mucilage of chondrus have been recommended as substitutes for syrup and glycerin. Neither of these substitutes will represent the sweetness of syrup without the addition of saccharin; both are more subject to decomposition. The extensive advertising of glycerin substitutes that are nothing but invert sugar syrups is misleading. They are substitutes only in gravity and freedom from crystallization, but are entirely devoid of the solvent and preservative action of glycerin.

Many substitutes for *Adeps lanae* have been suggested, but none of them have the same composition as the original, nor the same essential value even though they may resemble the physical characteristics.

The condition of the sugar market has led to active use of saccharin. Pronounced harmless by many unquestioned authorities, and condemned by others, legally used in some states and illegally in others, pronounced of decided advantage in preventing stomach and intestinal fermentation, there seems to be no good reason why it cannot be used except where the food value and preservative action of sugar is required. Even at the market value of \$23.00 per pound it is a cheaper sweetener than sugar. In Germany, laws forbidding the use of artificial sweetening substances, have been repealed. Saccharin and a new product dulcin, or sucrol, paraphenetolcarbamide, are largely used. Dulcin is 200 times as sweet as sugar and does not have the bitter after-taste of saccharin.

The offering of fictitious styrax at a price twenty times the former cost of the original genuine, now out of the market, has led to the questioning of its value and tincture of benzoin compound, substituting an equivalent of balsam of tolu for the styrax, is being used by several hospitals with perfect satisfaction.

The growth of some narcotic drugs in the United States that were formerly entirely imported, has served to somewhat reduce their price and to furnish products of exceptional value. There is still dispute about some such drugs. American cannabis is pronounced by some equal to, if not superior, to the foreign, while others consider it far inferior. While there is undoubtedly difference in quality in different lots of American grown, the wide range published may be due in part to the variation in results obtained by physiological tests of the same sample. The following reports were obtained from physiological tests of the same drug, the reports being submitted by three experts.

*Presented at Chicago meeting, A. Ph. A., 1918.

Report No. 1, using 7 times the U. S. P. quantity of drug: Three dogs had slight incoördination; three had considerable incoördination.

Report No. 2, using 4 times the U. S. P. quantity: All six dogs had slight incoördination.

Report No. 3, using the U. S. P. quantity: 0.03 mil of fluidextract of cannabis per kilo weight of dog.

Dog No. 1, considerable incoördination.

Dog No. 4, no incoördination.

Dog No. 2, drowsy, lays down, no incoördination

Dog No. 5, no incoördination.

Dog No. 3, drowsy, very slight, no incoördination.

Dog No. 6, drowsy, slight, incoördination.

Dog No. 7, slight incoördination.

Report No. 3, using 0.04 mil of fluidextract of cannabis per kilo weight of dog:

Dog No. 1, marked incoördination.

Dog No. 5, incoördination.

Dog No. 2, drowsy, slight incoördination.

Dog No. 6, marked incoördination.

Dog No. 3, considerable incoördination.

Dog No. 7, marked incoördination.

Dog No. 4, shivers, considerable incoördination.

Drug is 80% of U. S. P. strength.

Report No. 4, using 0.03 mil of fluidextract:

Dog No. 1, no ataxia.

Using 0.05 mil, possibly faint ataxia.

Dog No. 2, no ataxia.

Using 0.06 mil, very fair ataxia.

Dog No. 3, used control Cannabis, questionable ataxia.

Using 0.05 mil, slight ataxia.

Using 0.04 mil, no ataxia.

Using 0.05 mil, slight ataxia.

Using 0.05 mil, no ataxia.

Using 0.03 mil of control. Very good ataxia.

Drug is 60% of U. S. P. strength.

Variation in some products is due to variation in method of manufacture. Syrup of tolu is frequently made from "Soluble Tolu" furnished by the manufacturer and these vary much in character. The U. S. P. calls for 50 mils tincture of tolu, representing 10 Gm. of balsam in 1000 mils of syrup. Triturating the tincture with magnesium carbonate and water and evaporating gives 2.144 Gm. of residue, equivalent to 0.2144 Gm. in 100 mils of syrup.

Manufacturer No. 1, Soluble Tolu: Alcohol 20%, residue 0.17%. Formula: 1 1/4 fluid-ounces to 15 ounces of syrup gives a syrup containing about 0.013 Gm. balsam, or one-sixteenth of the U. S. P. strength. Original product was acid in reaction; 10 mils required 1.54 mils N/10 KOH.

Manufacturer No. 2, Soluble Tolu: Alcohol 25%, residue 2.58%. Formula same as No. 1, gives a syrup containing about 0.2 Gm. balsam, or about 93% of U. S. P. strength. Original product was alkaline; 10 mils required 2.0 mils N/10 H₂SO₄.

Manufacturer No. 3, Alcohol 25%, residue 1.2%. Formula: Twenty mils of product and 80 mils of syrup give a syrup about 1 1/8 times the U. S. P. strength. Original product was alkaline; 10 mils required 2.8 mils N/10 H₂SO₄.

Manufacturer No. 4, Alcohol 25%, residue 1.6%. Formula: Twenty mils of the product and 80 mils of syrup give a syrup about 1 1/2 times the U. S. P. strength. Original product was alkaline; 10 mils required 2.8 mils N/10 H₂SO₄. These comparisons are of no value unless the residue is determined to come from tolu only.

Scarcity of labor has rapidly advanced the prices of most of our native botanicals and led to carelessness in maintaining the standard of excellence. Wild cherry bark has been mixed with black cherry bark; white pine bark marketed entire instead of inner bark only, excess of stems and fibers are left attached to roots.

Licorice root has advanced to eight times its former cost and much inferior quality has been offered. Some bales contained a notable quantity of stems. One sample of powder was not licorice root. It contained only 8.3% soluble matter of foreign taste and 3.5% ash. It is said that imports from Asia derived from *Glycyrrhiza uralensis* Fischer, an unofficial species, have been frequent. The quality of root is good but comes mixed with a considerable quantity

of stems. It contains about the same amount of glycyrrhizic acid as the Spanish and Russian varieties.

The presence of glycerin in some chemical syrups and some tannin bearing fluid extracts should be retained and it should be dropped from preparations where it is valueless and merely adds to the cost, as fluidextracts of dandelion, hydrastis, tincture of gentian compound, etc. In aromatic fluidextract of cascara its mild laxative action may be of some service, but not proportionate to its high cost and it could well be replaced by syrup. It has been stated that glycerin is obtained by a new process from black strap molasses, 470 gallons yielding 506 pounds of glycerin and 145 gallons of absolute alcohol. Signed, E. L. PATCH.

The disarrangement of the collection of foreign drugs, due to the European war and the consequent disturbances in the collection of home drugs, and in the drug market is still in evidence. Almost every wild plant that grows is being gathered and submitted for inspection with the hope that it will prove to be *Hydrastis* or some one of the few drugs that under existing conditions are bringing and will bring for a limited period, a fancy price. Many have made large collections of non-medicinal plants before ascertaining the identity of the plant gathered and as a natural consequence, have had their trouble for their pains as well as in those cases where help was hired and paid for sustaining an actual money loss. Needless to say that these non-medicinal plants, gathered for the drug market, have not found their way into trade channels.

There is a tendency among collectors towards profiteering, as is shown by the gathering of those parts of plants not desirable. Examples are the presence of root leaves, stem bases and rootlets on rhizomes and roots which should be gathered free of these parts such as star grass, culvers root, trillium, etc.; the herb, whole or out for leaves, as in catnip, tansy, worm-wood, etc.; inflorescences in place of flowers, etc. This tendency should be rigidly guarded against and strenuously combatted. Signed, O. A. FARWELL.

ABSINTHIUM: Various species of *Artemisia* that have the leaves white woolly on both sides are gathered in quantities and offered as Wormwood. O. A. FARWELL.

ACID BENZOIC: Several shipments offered for entry containing as high as 30% of powdered boric acid. *Spatula*. One lot not perfectly white, a heavy powder, contained a brown substance insoluble in ether; ignited left no residue. E. L. PATCH.

ACID HYDROCYANIC, DILUTE: One shipment assaying only 1.75% of absolute acid was rejected. H. ENGELHARDT.

ACID OLEIC, PURIFIED: It seems to be rather difficult to get U. S. P. acid. A number of shipments we received had a high congealing point, showing the presence of an undue amount of solid fatty acids and some contained unsaponified fats. H. ENGELHARDT.

ACONITE LEAF: Aconite leaves seem to be a rarity. The leaf has given place to the herb in either the flowering or fruiting stage. O. A. FARWELL.

ACONITE ROOT: Two samples were of good quality. H. ENGELHARDT.

The tuber that is now on the market may be topped by as much as four inches of stem base. The smaller, plumper, lighter colored Japanese root is often inter-mixed.

O. A. FARWELL.

Japanese Aconite, *Aconitum fisheri* Reich, has been substituted for the official *Aconitum napellus* L. It does not contain aconitine, but other alkaloids and should not be used in any preparations of the U. S. P. Japanese aconite usually consists of mother tubers with stem bases and daughter tubers with buds. They are smaller in size, lighter, smoother, less wrinkled and not twisted, generally more mealy (due to starch) and have a different arrangement of the fibro-vascular bundles, not so markedly star shaped. DEPARTMENT OF AGRICULTURE.

ALCOHOL: Two barrels of Cologne Spirit yellowed with KOH solution and turned brown rapidly with silver nitrate and were slightly deficient in strength. E. L. PATCH.

ALUM, DRIED: One lot was a mixture of potassium and ammonium alums, contained 6% of water (U. S. P. allows 10%), entirely soluble in hot water. One lot contained 15% of water and 1.5% insoluble in water. E. L. PATCH.

AMERICAN HEMP: No. 1 gave 3.6% ether-soluble resin. No. 2, 15.9%. No. 3, 9%. No. 4, 14.2%. No. 5, 14.2%. No. 6, 7.8%. E. L. PATCH.

Sample contained 11.5% of seeds; gave 15.3% of oleoresin. Physiologically tested: Normal doses *per os* and by intravenous injection, well-marked symptoms within one hour and a second injection rapidly killed the animal by cardio-inhibition. I am of the opinion that the

sample is a physiologically active product which is indistinguishable from the ordinary *Cannabis Indica*.

ERNEST J. LARRY, London, Eng.

APOMORPHINE: The amorphous variety was offered and was rejected because it is a well-known fact that this modification produces physiological effects other than those produced by the crystalline variety and besides is considerably more toxic. H. ENGELHARDT.

ANTISEPTIC CORROSIVE TABLETS U. S. P.: Assayed 46.315% corrosive sublimate and 53.685% sodium chloride. It is difficult to maintain a uniform mixture of 50% of each. Second lot assayed 50.05% corrosive sublimate and 50.03% sodium chloride.

E. L. PATCH.

ARNICA FLOWERS: *Inula britannica* L. has been mixed with and substituted for arnica flowers. The ray flowers are smaller in length and width than those of true arnica. The veins number four, while those of true arnica are seven to twelve. The receptacle is smooth instead of hairy as in true arnica.

DEPARTMENT OF FOOD AND DRUGS.

ASAFOETIDA: Of four samples we rejected one yielding only 26% alcohol-soluble matter and leaving 30% of ash on incineration.

H. ENGELHARDT.

ASPIDOSPERMA: The official drug has come to be a rarity. The red quebracho has been substituted for it as well as some other unknown bark which bears a more or less close resemblance to the outer portion only of the official bark.

O. A. FARWELL.

ASPIRIN: A spurious product has been found in nearly all large centers of Texas.

Pharm. Era.

BARIUM DIOXIDE: Assay 86.4% BaO₂, traces of chloride and nitrate.

E. L. PATCH.

BEEF EXTRACT: Protein contents vary; 34.82%, 50.5%, 50%, 45.18%, 53.42%, 52.72%; salt from 3.65% to 8%.

E. L. PATCH.

BEEFWAX: Of fifteen samples of white wax only one was adulterated. This adulteration was white lead.

K. F. EHMANN.

BELLADONNA LEAF: Sample sold for 0.690 assayed 0.389; other lots 0.390, 0.497, 0.720, 0.425.

E. L. PATCH.

Since this drug has become scarce, the common nightshade, *Solanum nigrum* L., has been gathered in all sections of the country and offered in large quantities for belladonna.

O. A. FARWELL.

We examined 23 shipments of which only two had to be rejected on account of being below the U. S. P. standard. The quality of this drug which was cultivated in this country was very good; one lot assayed as high as 1.1% of total mydriatic alkaloids. One shipment was received which was marked as "belladonna herb," but did not contain any alkaloids; it was derived from a solanaceous plant.

H. ENGELHARDT.

Examination of samples of importations of "belladonna leaves" has disclosed that *Solanum nigrum* L. has been substituted in some instances for the true material. Since this species contains alkaloids other than those present in genuine belladonna, it should be excluded.

DEPARTMENT AGRICULTURE.

BELLADONNA ROOT: Belladonna root seems to be unobtainable; two shipments were of good quality.

H. ENGELHARDT.

Examination of samples of importations has disclosed that the roots of yellow dock, *Rumex crispus* L. were substituted in one instance for the true material. The yellow dock roots are externally reddish brown, deeply longitudinally wrinkled, finely annulate above and have a somewhat fibrous fracture, whereas those of *Atropa belladonna* are externally pale brownish gray, show only weak longitudinal wrinkles and have a nearly smooth fracture.

DEPARTMENT OF AGRICULTURE.

BETANAPHTHOL: One lot was dark colored, rank in odor and not completely soluble in ammonia water.

E. L. PATCH.

BISMUTH SUBNITRATE: Two hundred pounds of precipitated chalk was fraudulently sold in packages labeled "Merck's Bismuth Subnitrate." Another lot bore the labels of "Mallinckrodt Chemical Company." Detectives are looking for the seller.

Pharmaceutical Record.

BLUE FLAG: The rootlets often are not removed. In addition it is frequently and sometimes largely intermixed with a rhizome similar in all respects to the official except in color,

which is white. Whether it is merely a color phase, or the rhizome of a different species has not been proven.

O. A. FARWELL.

BORAGE: The leaves and even the inflorescence of an allied plant, the Bugloss (*Echium vulgare* L.) have found their way to the drug markets for borage.

The former are rougher and more densely pubescent and the hairs lack the broad disk-like base of the hairs of true borage. The flowers of the Bugloss are bilabiate while those of Borage are regular and rotate.

O. A. FARWELL.

BUCHU: Attention is called to the fact that samples labeled as "long," "short" and "oval" buchu leaves offered in the trade have been found to be obtained from species not official in the U. S. P. The "long buchu" proved to be *Empleurum serratulum*, the "short buchu" *Barosma pulchellum*, and the "oval buchu" *Barosma crenulata*, var. *latifolia*. The flavor of the three adulterants is markedly different from that of the official species. They should not be used in official preparations.

DEPARTMENT OF AGRICULTURE.

BURDOCK ROOT: Large quantities of the root of the second year plant are put upon the market; the root at this stage is very woody and useless.

O. A. FARWELL.

BUTTERNUT: This drug frequently is the source of much trouble because of the heavy cork on the unpeeled root and of the bark of the larger branches which are used as adulterants.

O. A. FARWELL.

CALCIUM GLYCEROPHOSPHATE: A few small shipments contained too large an excess of chloride.

H. ENGELHARDT.

CAMPHORATED OIL: Fifty-two samples deficient in camphor. Massachusetts State Board. Estimated by heat, 18.1%, 18.85%, 20.1%, 13.25%. U. S. P. 20%.

E. L. PATCH.

CANNABIS INDICA: A very perceptible change is noticeable in this commodity. The percentage of matured seeds in the drug imported from India has greatly increased, probably in many instances beyond the maximum amount allowed by the U. S. P. The drug from the American plant does not answer the pharmacopoeial requirements at all since in most instances it consists of all those parts of the plant in fruiting stage, which cannot be used for the production of hemp. Even the male plant has been gathered and stored for medicinal purposes. The relative values of the crude drug originating in different countries, is still in the debatable stage; the value of the crude drugs may vary according to the time of collection and the part or parts of the plant gathered, but if the preparations made from these variable crude drugs were brought by physiological assay to a uniform standard for the finished product, it is more than probable that this drug as a fertile subject for future discussions of its variableness would immediately drop out of sight.

O. A. FARWELL.

We may say that samples of Indian hemp submitted answered all the physiological tests prescribed by the U. S. P. but the samples of domestic hemp were generally far below the requirements. I do not wish to go into details about the rather unreliable physiological assay process required by the U. S. P., but only want to point out that a great deal can be done towards improving this process. Unless a more reliable method can be proposed the physiological assay of Cannabis should be discarded altogether.

H. ENGELHARDT.

CAPSICUM: Extractive, alcoholic, 15, 21.6, 23.7, 23, 21.5, 25, 23.5, 25.6; ash, 7, 6.98, 6.9

E. L. PATCH.

CARAWAY SEED: Foreign seeds, 1.15% chaff and dirt; freed from above yields, 6.6% ash.

E. L. PATCH.

CASCARA BARK: The adulterant previously mentioned has been identified as the bark of *Prunus padus*.

JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION.

CHALK PRECIPITATED: Assay 94% (U. S. P. 98%) excess of chlorides, 98.85%, 98.85%, 98.35%.

E. L. PATCH.

CHAMOMILE: Examination of importations of "Chamomile flowers," *Matricaria chamomilla*, L. have disclosed in some instances that the flowers of dog fennel, *Anthemis cotula* L. have been submitted in amounts up to 25%. The flowers of *Matricaria chamomilla* have naked, hollow receptacles, whereas those of *Anthemis cotula* are solid and chaffy.

U. S. DEPARTMENT OF AGRICULTURE.

The flower heads of *Anthemis arvensis*, the field chamomile have been substituted; they are readily distinguished by the persistent chaff and solid receptacle.

O. A. FARWELL.

CHENOPODIUM: *Chenopodium album* has been offered in place of the *C. anthelminticum*. Texas appears to be the source of origin. O. A. FARWELL.

CINCHONA: Lots have been offered for entry under names recognized in the U. S. P., but deficient in alkaloids. DEPARTMENT OF AGRICULTURE.

Four shipments of *Cinchona calisaya* and two of red cinchona answered fully the requirements of the U. S. P. H. ENGELHARDT.

Yellow bark 8.05 total alkaloids; red cinchona 7.25%.

E. L. PATCH.

Many samples from different sources indicating a wide collection, have been received under the name "Cascarilla;" the bark does not resemble any of the official cinchona barks externally. It may be derived from one or more species of the genus cascarilla. It is said that the cascarilla barks do not contain the cinchona alkaloids. O. A. FARWELL.

COLCHICUM ROOT: Colchicum root is practically unobtainable. Four samples examined were of good quality. H. ENGELHARDT.

0.53%, 0.45%, 0.36%, 0.4%, 0.43%, U. S. P. 0.35%.

E. L. PATCH.

CONIUM LEAVES: Parsley leaves have been used as a substitute; also the leaves of *Aethusa cynapium*. O. A. FARWELL.

COD LIVER OIL: One lot very inferior. Refractive index at 17.5° C. 1.4771. Would not stand the fuming nitric acid test. E. L. PATCH.

COD LIVERS: Powdered, 95% volume alcohol extracted 46.85%; 10% volume alcohol extracted 10.3%. Average loss by drying at 100° C. 11.95%. Extract made with 95% volume alcohol is insoluble in 10%, 15% or 20% alcohol. E. L. PATCH.

CUBEBS: It is becoming increasingly difficult to obtain a first class quality of cubebs answering the U. S. P. requirements. The stems present are usually excessive; also the peduncled fruits of other species are in more or less evidence. O. A. FARWELL.

DANDELION ROOT: In some instances roots obtained from *Lactuca canadensis* L., *Lactuca spicata* (Lam.) Hitchc., or other species of lactuca have been substituted. The roots of *Taraxacum officinale*, true dandelion, may be distinguished by the concentrically arranged groups of laticiferous vessels and sieve tubes which alternate with whitish inulin-bearing parenchyma. Lactuca root is characterized by its tracheae which are arranged in radial rows, usually one cell wide, alternating with medullary rays, two or three cells wide.

U. S. DEPARTMENT OF AGRICULTURE.

Samples from importations disclosed the presence of 40% of roots which were badly discolored inside and did not show a porous, pale, yellow wood as required by the U. S. P. The appearance suggested that the material had been improperly dried. This fact was confirmed by microscopic examination, showing swollen brownish yellow masses indicating that inulin masses had been partially hydrolyzed and caramelized. Samples containing more than 15% of such dead roots should be rejected.

U. S. DEPARTMENT OF AGRICULTURE.

DIGITALIS LEAVES: The domestic drug was generally found to be of very good quality. In connection with the physiological test for this drug I may call attention to the article published by Mr. H. C. Colson of this laboratory in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1918, page 73. It was found that the twelve-hour frog test is more reliable than the one-hour official test and the cat test is superior to both of them.

H. ENGELHARDT.

Large quantities of *Digitalis thapsi* were imported under the name of "Spanish Digitalis;" but the substitution was quickly detected and its importation prohibited.

O. A. FARWELL.

Recent work has revealed the fact that American digitalis is as potent and valuable medicinally as any heretofore imported from Central Europe. It has been found that the digitalis plant growing wild in Oregon and Washington needs only harvesting and collecting to be of great assistance to war medical work. *Pharmaceutical Era*.

DITTANY: The European or Cretan dittany has been imported and offered as dittany.

O. A. FARWELL.

(To be continued.)

CORRESPONDENCE

UTILIZATION OF INVENTIVE TALENT.

D. W. Brinton, of the U. S. Naval Consulting Board, 15 Park Row, New York City, writes that some of the civilian engineers of this country are now rendering great service to the Government through the agencies of the Council of National Defense, the Naval Consulting Board the National Research Council, and their numerous auxiliary committees, but, unfortunately, only a small proportion of the technical men of this country are so situated that they can go to Washington and engage in this service; therefore, some means of utilizing the patriotism and originative thought of our members had to be devised.

For this purpose the War Committee of Technical Societies has been organized, and it hopes to give the members of the Technical Societies who are obliged to stay at home, an opportunity to use their inventive talent and technical training in the study of the varied problems which arise in the preparation for and prosecution of the war—thus making valuable contributions to the national cause.

The greatest care will be taken to discover and utilize everything of value that may inhere in suggestions and inventions submitted. Not only will they receive studious examination, but when necessary, trials and experiments will be conducted. All inventions which have successfully passed the necessary examinations and tests are turned over to the particular department of the Army and Navy Service, where they may be most profitably utilized.

THE STRONTIUM BROMIDE PRESCRIPTION.

The letter of Dr. S. Solis Cohen, which appears in the August issue, has my attention. I am glad that the doctor has taken the pains to lay his experience before the pharmaceutical profession, for in this way we learn our shortcomings, and are enabled to correct them.

His experience may be regarded as a reflection upon the efficiency of the Board of Pharmacy, which should discover such apparent incompetency in pharmaceutical ranks.

It was at the meeting of the A. Ph. A. in Atlantic City that I listened to an address by Doctor Cohen, in which he led his audience to think that boards of pharmacy seemed to ask questions such as the examinees may not be familiar with. Now, if the type of prescriptions that the doctor has had such inferior pharmaceutical service from, is in the class he had in mind, then the Pennsylvania Board of Pharmacy must plead guilty, because it is one of its hobbies to feature the principles that are involved in dispensing prescriptions of like character, in every examination.

Notwithstanding criticisms to the contrary, the policy of the Board has not been officious nor over-exacting, hence it does not reject an applicant because he is unable to show himself to be 100 percent perfect in all branches.

As presiding officer of said Board I would be glad to have a consensus of opinion of the medical and pharmaceutical profession, as to whether or not a failure on the part of an examinee to properly prepare a prescription as cited by Doctor Cohen should warrant rejection, if his record on all other branches were such as would favor a passing grade.

Yours respectfully,

LOUIS EMANUEL.

P. S.—In the interests of a perfect pharmacopoeia, it may not be improper to ask the doctor why he gets better results from the use of strontium bromide of a special brand, than he does from the chemical of the same title of U. S. P. standard of quality, purity and strength.

LOUIS EMANUEL.

PITTSBURGH, PA., August 21, 1918.

THE EDITOR: Noting Dr. Solis Cohen's communication to the JOURNAL regarding the strontium bromide prescription as well as your reply to it, it seems to me that the very tangible reason for an occasional misinterpretation of the quantity of the bromide lies in the fact that

the specified brand of bromide prescribed (probably the Paraf-Javal) is *more often* prescribed and *better known* in the form of a solution. The wide-awake pharmacist, however, discounting the fact that many careless physicians often fail to indicate on their prescriptions the difference between the fluid and solid measurement symbols, ought to be well enough abreast of the times to know that the careful physician, and Dr. Cohen is well known to be in this class, would write for Liquor Stront. Brom., when this was wanted, and would designate the symbolic quantities accordingly. He should also know that there *is* on the market such a product as strontium bromide (Paraf-Javal). I disagree with you, therefore, when you state in your answer that "the brand of the salt has nothing to do with the case." Were it not for this specification Doctor Cohen would not have experienced any trouble whatever, for I believe with you that the Philadelphia druggist in common with the rest of his professional brothers *does* understand the difference between a fluid and a solid(!) ounce.

Yours cordially,

PHILADELPHIA, August 17, 1918.

IVOR GRIFFITH.

IMPORTANT NOTICE FOR SCHOOLS AND COLLEGES OF PHARMACY.

The action taken at the Indianapolis Meeting relative to the award of the Fairchild Scholarship for this year is expressed in Recommendation No. 5 of President R. A. Lyman's address, and which reads:

"That it be the sense of the Conference that Mr. Fairchild could render the greatest service to pharmacy by offering the scholarship to a graduate pharmacy student, in order that he might pursue some research problem for one full school year, in the school of his choice; and further, that this scholarship be awarded on the basis of the applicant's scholastic training, his standing as an undergraduate pharmaceutical student and upon his fitness to do research."

The Committee to whom the matter of formulating a definite plan for awarding the Fairchild Scholarship was referred consists of H. C. Christensen, Chairman, 4149 Vincennes St., Chicago, Ill., Prof. J. W. Sturmer, 145 N. 10th St., Phila., Dr. George C. Dickman, 115 West 68th St., New York, and Dr. R. A. Lyman, c/o The University of Nebraska, Lincoln, Neb.

The Committee has decided that in making the award:

The ability of the candidate to perform research work be given a value of 50 credit units; the pharmaceutical scholastic record a value of 40 credit units; and the non-pharmaceutical scholastic record (above high school grade) a value of 10 credit units.

Further, that the candidate's ability to perform research work be determined upon evidence of research work previously accomplished, and that such evidence may take the form of a thesis presented at a college of pharmacy, or a paper covering research work carried out at a college, but in the latter case it should be accompanied by a certification from the dean that the paper represents the student's individual work. A published paper covering research work performed by the candidate subsequent to his graduation may also be accepted as evidence—at the discretion of the Committee.

The Committee reports further:

"It is to be clearly understood that this procedure does not necessarily represent the views of the members of this Committee on Examination on the larger problem of the awarding of the Scholarship, but is merely a practical plan decided upon the basis laid down at the Indianapolis meeting last year."

Schools or Colleges of the American Conference of Pharmaceutical Faculties, therefore having a candidate to present for the Fairchild Scholarship, should at once send his credentials, etc., to Chairman H. C. Christensen, 4149 Vincennes St., Chicago, so as to reach him not later than October 1, in order that the award may be made soon thereafter.

The Chairman of the Fairchild Scholarship Committee would also request that the Schools and Colleges give the matter of the Fairchild Scholarship consideration. As the Schools are perhaps most interested it is requested that all Schools present their views in writing to Secretary Theodore

J. Bradley, of the Conference, c/o Massachusetts College of Pharmacy, Boston, Mass., prior to December 1, 1918, with a view to having him lay before the incoming Fairchild Scholarship Committee these expressions, so that this Committee can be assured of having all Schools interested to the fullest extent when they formulate their plans of award for next year, and with the hope these will establish the method of award hereafter.

We thank you for giving both these matters your prompt consideration. The first should have immediate attention.

Respectfully,

The Fairchild Scholarship Committee.

CHANCE IN COLLEGE OR VOCATIONAL SCHOOLS FOR ALL BOYS OF 18.

All of our readers have by this time read of the opportunities that are to be given young men to enter schools or colleges during the first year or longer of their enlistment. Conferences have been held on the matter with school officials and the War Department. What opportunity pharmacy students will have we are not advised, but it is probable that satisfactory arrangements will be made.

A letter by Colonel Robert I. Rees reads:

"All young men who were planning to go to school this fall should carry out their plans to do so. Each should go to the college of his choice, matriculate and enter as a regular student.

"As soon as possible after registration day, probably on or about October 1, opportunity will be given for all the regularly-enrolled students to be inducted into the Students' Army Training Corps at the schools where they are in attendance.

"The student, by voluntary induction, becomes a soldier in the United States Army, uniformed, subject to military discipline and with the pay of a private. They will simultaneously be placed on full active duty, and contracts will be made as soon as possible with the colleges for the housing, subsistence and instruction of the student soldiers."

There are no exceptions or discriminations. The same rule applies to all boys of eighteen who are well enough educated to pass the entrance requirements of the colleges and universities.

Boys who can not pass the entrance requirements to colleges and who have only grammar school education, will have opportunity to apply for admission to vocational schools.

OPPORTUNITY IN HAITI FOR AMERICAN PHARMACISTS.

AMERICAN PHARMACEUTICAL ASSOCIATION:

The declaration of war upon Germany by the Republic of Haiti has led to the sequestration of most of the German firms doing business in the Republic. Prior to the declaration practically the entire drug business was controlled by Germans whose establishments have now been closed, with the result that at the present time the few remaining pharmacists, Haitian-owned, are worked beyond their capacity with limited stocks and more or less incompetent clerks.

As the head of the Public Health Service of Haiti I am exceedingly anxious to see a dependable trade in pharmaceuticals established in the island, and as an American I am anxious that the trade should in future be dominated by Americans, thus insuring the sale of American products and the establishment of the drug business on an American basis. The drug business here has always been a thriving and exceedingly profitable one, and this offers an exceptional opportunity. Sufficient capital would of course be required.

(Capable, wide-awake American pharmacists are desired.)

N. M. LEON,
Surgeon, U. S. Navy,
Sanitary Engineer of Haiti.

Port au Prince,
Haiti,
August 16, 1918.

COUNCIL BUSINESS

COUNCIL MEETINGS.

THIRD SESSION OF THE COUNCIL, 1917-1918.

The Third Session of the Council of the American Pharmaceutical Association for 1917-18 was held at the Congress Hotel, Chicago, on Tuesday, August 13, 1918, at 7.30 P.M.

The meeting was called to order at 7.30 P.M. by Chairman L. C. Hopp.

Present: Messrs. L. C. Hopp, H. V. Arny, T. J. Bradley, Jacob Diner, Clair A. Dye, R. P. Fischelis, J. W. England, E. N. Gathercoal, J. G. Godding, S. L. Hilton, C. B. Jordan, L. E. Sayre, L. A. Seltzer, Clyde M. Snow, Dr. F. E. Stewart, Dr. Henry M. Whelpley, F. J. Wulling, E. F. Kelly, E. G. Eberle, W. B. Day, J. A. Koch and Jeannot Hostmann.

The reading of the minutes of the second session for 1917-18, held at the Hotel Claypool (Indianapolis), on September 1, 1917, was, on motion, dispensed with. (See p. 1104, December Journal, A. Ph. A., 1917.)

Announcement was made of the passage of *Motion No. 30 (Election of Members, Nos. 269 to 298, inclusive)* and of *Motion No. 31 (Establishment of Wilkes-Barre Branch, A. Ph. A.)*.

Applications for membership from Nos. 299 to 395, inclusive, were presented and favorably acted upon. The list was:

- No. 299. Patrick Joseph Biesty, 12 Haverford St., Jamaica Plain, Mass. Awarded prize in Massachusetts College of Pharmacy. Rec. by E. H. LaPierre and Theo. J. Bradley.
- No. 300. Arthur E. Fechter, 321 North Clark St., Chicago, Ill., rec. by E. P. Noennam and Wm. B. Day.
- No. 301. Leon Nahabed Charkoudian, 252 Worthington St., Springfield, Mass. Awarded Prize in Massachusetts College of Pharmacy. Rec. by Theo. J. Bradley and John G. Godding.
- No. 302. Argiris Georges Sampanis, 179 Warren Ave., Boston, Mass. Awarded Prize in the Massachusetts College of Pharmacy. Rec. by Howard H. Smith and Theo. J. Bradley.
- No. 303. Arthur Nutter Brown, 27 Warwick St., Boston, Mass. Awarded Prize in the Massachusetts College of Pharmacy. Rec. by John G. Godding and Theo. J. Bradley.
- No. 304. Roscoe Tracy Burrows, Noank, Ct. Awarded Prize in the Massachusetts College of Pharmacy. Rec. by C. Herbert Packard and Theo. J. Bradley.
- No. 305. Ewell Ashby Brugh, Altavista, Va., rec. by W. F. Rudd and Philip F. Fackenthall.
- No. 306. Julian Lichtenstein, 17th & Main Sts., Richmond, Va., rec. by W. F. Rudd and J. E. Jackson.
- No. 307. Horace C. Littlejohn, Leesburg, Va., rec. by W. F. Rudd and J. E. Jackson.
- No. 308. Frank Schrage, 2200 N. Clark Street, Chicago, Ill., rec. by E. P. Noennam and Wm. B. Day.
- No. 309. Leon Clifton Ellis, 2 Market Street, Lynn, Mass., rec. by John G. Godding and Theo. J. Bradley.
- No. 310. Roger E. Monroe, 500 W. Broad Street, Richmond, Va., rec. by W. F. Rudd and E. Brandis.
- No. 311. Charles T. Hull, 141 Dixwell Ave., New Haven, Conn., rec. by J. W. England and E. G. Eberle.
- No. 312. Frank Taylor Stone, 1210 Pa. Ave., N. W., Washington, D. C., rec. by J. C. Peacock and J. W. England.
- No. 313. Bert Alexander Smyser, 1400 Pa. Ave., S. E., Washington, D. C., rec. by Redmond Mayo and S. L. Hilton.
- No. 314. E. Paul Gibney, 146 W. Kinzie Street, Chicago, Ill., rec. by William Gray and Wm. B. Day.
- No. 315. Charles Reynolds Rhodes, Hyndman, Pa., rec. by Robert P. Fischelis and Charles H. LaWall.
- No. 316. Archie L. Tufts, 1359 St. Nicholas Ave., New York, N. Y., rec. by Hugo Kantrowitz and E. G. Eberle.
- No. 317. John J. McClugage, 1140 E. 63rd St., Chicago, Ill., rec. by Wm. B. Day and M. A. Miner.

- No. 318. George M. Bennett, 135-37 W. Main Street, Urbana, Ill., rec. by Wm. B. Day and Jas. H. Beal.
- No. 319. Samuel Morgan Evans, 408 Luzerne Ave., W. Pittston, Pa., rec. by P. Henry Utech and Wm. B. Day.
- No. 320. Donald Cameron Margerum, 30 S. 10th St., Philadelphia, Pa., rec. by Charles H. LaWall and J. C. Peacock.
- No. 321. Ernest Louis Naviaux, 26 S. Crawford Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 322. Charles Hugo Grund, Jr., 3511 Archer Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 323. Charles G. Knight, 338 E. 51st Street, Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 324. F. G. J. Stieber, 33rd Street & Indiana Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 325. Miguel A. Veve, Box 96, Fajardo, Puerto Rico., rec. by Rudolph Wirth and Robert C. Pursell.
- No. 326. Luis Mulet, Avenue 11th, August No. 74, Mayaguez, Porto Rico, rec. by Rudolph Wirth and Robert C. Pursell.
- No. 327. Carl Abrahamson, 540 W. Randolph Street, Chicago, Ill., rec. by O. F. Fuller and Wm. B. Day.
- No. 328. Charles Fuller, 540 W. Randolph Street, Chicago, Ill., rec. by O. F. Fuller and Wm. B. Day.
- No. 329. Albert A. Kurrasch, 301 W. 47th Street, Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 330. Edward T. Hahn, 1242 N. 53rd St., Philadelphia, Pa., rec. by J. C. Peacock and Bertha L. Peacock.
- No. 331. Arthur W. Stadelmann, 1553 W. 69th St., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 332. Jos. Parks Thomas, 1916 W. Chestnut Street, Altoona, Pa., rec. by J. A. Koch and John H. Wurdack.
- No. 333. John Krizan, 4200 West Van Buren St., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 334. Ralph Milton Eberly, 27 N. Broadway, Aurora, Ill., rec. by Wm. B. Day and L. C. Staudt.
- No. 335. L. N. Benton, 31 So. Broadway, Aurora, Ill., rec. by Wm. B. Day and L. C. Staudt.
- No. 336. George Zoeller, 1557 West Chicago Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 337. Louis A. Elisburg, 6260 Champlain Ave., Chicago, Ill., rec. by J. W. England and E. G. Eberle.
- No. 338. Charles E. Graham, 403 East 8th St., Kansas City, Mo., rec. by Henry D. Lewellyn and M. W. Whitney.
- No. 339. Felix Wm. McClerkin, 700 Main St., Little Rock, Ark., rec. by Frank Schachleiter and H. M. Whelpley.
- No. 340. John George Mick, 2843 Indiana Ave., Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 341. Carroll E. Wood, 201 9th Ave., S. W., Roanoke, Va., rec. by Maud Lambert and W. F. Rudd.
- No. 342. Marshall L. Bize, 7th Avenue, Ybor City, Fla., rec. by M. M. Taylor and E. Berger.

The Report of the Secretary of the Council was presented and approved. It was as follows:

Members of the Council.

GENTLEMEN:

The Council held sessions at the Indianapolis (1917) meeting and has transacted its business by mail since.

Twenty Council Letters have been issued covering 45 pages and 31 motions.

A synopsis of the motions of the Council is attached.

The members elected to date number 395; the number elected last year by the first session at Indianapolis was 310.

The membership of the Council numbers 40, of which 17 are representatives of local branches.

A number of changes of membership have taken place. Charles Holzhauer and Wm. L. Dewoody are deceased. E. F. Kelly has succeeded H. Engelhardt.

There are 21 local branches, including the Wilkes-Barre Branch, permission for the establishment of which was granted last month, of which 17 at present have Council representatives; those not having are West Virginia, Montana, Wilkes-Barre and Cuba.

The three members of the Council elected by mail in November last for 1918-19 were: Caswell A. Mayo, New York; Charles E. Caspari, St. Louis; and Charles Holzhauer (since deceased).

Respectfully submitted,

August 12, 1918.

J. W. ENGLAND,
Secretary of the Council.

SYNOPSIS OF MOTIONS OF THE COUNCIL, 1917-18.

Motion No. 1. That \$100 be appropriated for the expenses of the Committee on Membership. Carried.

Motion No. 2. That the sum of \$25 be appropriated towards the expenses of the American Joint Committee on Horticultural Nomenclature. Carried.

Motion No. 3. That \$10 be appropriated for an organization-membership for the American Pharmaceutical Association in the American Metric Association. Carried.

Motion No. 4. That an additional appropriation of \$400 for the Year Book, 1915, Vol. 4, be made. Carried.

Motion No. 5. That an appropriation of \$75 be made for the purchase of buttons and pins. Carried.

Motion No. 6. Election of members Nos. 1 to 19, inclusive. Carried.

Motion No. 7. That a special Committee on Research be appointed. Carried.

Motion No. 8. That the Council chairman and the Association president join in the appointing of the Special Committee on Research. Not carried.

Motion No. 9. That a chairman of the Special Committee on Research be appointed and that he be asked to recommend names for the remaining positions on the committee; to be voted upon by the Council. Carried.

Motion No. 10. That there be placed in nomination for election by the Council fifteen nominees, as follows: The five members of the Scientific Section Committee, the five members of the Council Committee on Financial Control of N. F., and five additional nominees to be named by the Council; from these fifteen nominations the ten members are to be elected. Not carried.

Motion No. 11. Election of members Nos. 26 to 27, inclusive. Carried.

Motion No. 12. That the 66th annual convention of the American Pharmaceutical Association be held in the week beginning August 12, 1918. Carried.

Motion No. 13. That E. N. Gathercoal, of Chicago, be elected as Local Secretary for 1918. Carried.

Announcement of the death of Charles Holzhauer, President of the American Pharmaceutical Association, on November 19, 1917.

Motion No. 14. That proposed budget of appropriations for 1918 be approved. Carried.

PROPOSED BUDGET OF APPROPRIATIONS FOR 1918.

Appropriations for General Expenses:

| | | |
|-----------------------------------------------------------|----------|----------|
| No. 1. Salaries..... | \$ 6,150 | |
| No. 2. Printing, Postage and Stationery..... | 1,000 | |
| No. 3. Clerical Expenses, Secretary's Office..... | 416 | |
| No. 4. Miscellaneous Expenses..... | 200 | |

| | | <hr/> |
| | | \$19,441 |

Motion No. 15. That an additional appropriation of \$28 72 be made for Women's Section for 1916-17. Carried.

Motion No. 16. Election of members Nos. 28 to 62, inclusive. Carried.

Announcement of the death of Joseph P. Remington, past President of the American Pharmaceutical Association, on January 1, 1918.

Motion No. 17. Recommendation for membership of Committee on Research. Carried.

The Committee on Research designated was: Harry V. Arny, Chairman (appointed by the Chairman of the Council), George M. Beringer, Julius A. Koch, Henry Kraemer, Charles H. LaWall, Edward Kremers, Wilbur L. Scoville, Alviso B. Stevens, Frederick B. Power and Henry Milton Whelpley.

Motion No. 18. Election of members Nos. 63 to 68, inclusive. Carried.

Motion No. 19. Election of members Nos. 69 to 84, inclusive. Carried.

Motion No. 20. Grant of Request of Smithsonian Institute for Journals. Carried.

Motion No. 21. Election of members Nos. 85 to 114, inclusive. Carried.

Motion No. 22. That the program for the 1918 Annual Meeting as finally revised be approved. Carried.

Motion No. 23. Election of members Nos. 115 to 133, inclusive. Carried.

Motion No. 24. That the Council grant the request of the New York Branch for the consent and moral support of the parent organization in the awarding of the proposed Joseph P. Remington Medal (C. L. No. 14). Carried.

Motion No. 25. Election of members Nos. 134 to 144, inclusive. Carried.

Motion No. 26. Election of members Nos. 145 to 204, inclusive. Carried.

Motion No. 27. That the Treasurer be directed to invest in Liberty Bonds, two thousand dollars or more, in addition to the ten thousand dollars already invested in such bonds, for account of the American Pharmaceutical Association Research Fund. Carried.

Motion No. 28. Election of members Nos. 205 to 247, inclusive. Carried.

Announcement of the death of William L. Dewoody, Honorary President of the American Pharmaceutical Association.

Motion No. 29. Election of members Nos. 248 to 266, inclusive. Carried.

Motion No. 30. Election of members Nos. 269 to 298, inclusive. Carried.

Motion No. 31. Granting of Petition to Establish Wilkes-Barre Branch, A. Ph. A. Carried.

Attention was called to the rising costs of the clerical and other work of the officials of the Association and the subject was discussed at length.

On motion of H. V. Arny, seconded by Dr. F. E. Stewart, the subject was referred to the Committee on Finance to consider and report upon later to the Council.

NATIONAL DRUG TRADE CONFERENCE.

President James H. Beal, of the National Drug Trade Conference, has appointed the following important committees: Committee on Pharmaceutical Corps, Samuel C. Henry, chairman; Charles J. Lynn and S. L. Hilton. Committee on Alcohol Legislation, Charles M. Woodruff, chairman; Charles A. West and James F. Finneran. Committee on Anti-Narcotic Legislation, John C. Wallace, chairman; Fred K. Fernald and Eugene C. Brokmeyer. Committee on Formulas and Labels, Harry B. Thompson, chairman; C. Mahlon Kline and Charles M. Woodruff.

Editor: E. G. FBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

TREATMENT OF WAR WOUNDS BY MAGNESIUM SULPHATE

According to the *Scientific American*, Doctors Morrison and Tulloch now obtain very good results in the treatment of wounds by the use of the following solution which is sterilized by heating in a digester of the usual type: Magnesium sulphate, 400 parts, dissolved in a mixture of 100 parts glycerine and 300 parts boiling water. In the treatment of a fresh wound, this is opened widely and a 5 percent phenol solution is applied for 24 hours, after which the preceding solution is applied by means of compresses. The solution is renewed every 12 hours in the case of suppurated wounds. The pus disappears in two or three days, the scars become detached and the wound is now a bright red color. Growth of the epithelium is rapid, and the treatment can be continued until the wound is entirely healed. The solution should be employed in the above strength, for it is found that weaker solutions are not sufficiently active in the cure. As to the method of action which enters in here, this takes place by osmose, as in the case of Wright's solution. It will be remembered that the latter contains 5 parts citrate of soda and 50 parts salt per 1,000 parts water. Magnesium sulphate, when thus employed, is said to be painless. As it is not absorbed by the system, it cannot exert a harmful action on the white corpuscles contained within the granulations. It has a specific destructive action upon various microbes such as the coli and pyocyanic bacillus.

INCREASING THE SOLUBILITY OF BORIC ACID BY MEANS OF SODIUM BORATE.

H. L. Harris communicates to us that the research chemist of the Pacific Coast Borax Company advises that 12 parts of borax and 13 parts of boric acid will dissolve in 75 parts of water, thus making a solution containing the equivalent of 19 percent of boric acid.

THE CONVERSION OF SUGAR IN SYRUP TO INTENSIFY ITS SWEETENING POWER.

J. J. Willaman suggests the following formula for a syrup containing invert sugar: To 10 pounds of granulated sugar, four and one-half pints of water and one-fifth of an ounce of tartaric acid. The solution is boiled slowly in a covered vessel for from thirty to thirty-five minutes, taking care to discontinue boiling before the syrup darkens. This will yield about 14 pounds of a syrup, which the author states has pound for pound the same sweetening power as sugar. The calculation is made on the basis that 105.24 pounds of invert sugar possesses the sweetening power of 135 pounds of cane sugar.

THE GLYCERIN SITUATION.

Officials in the Food Administration, War Industries Board, and elsewhere in the war work establishments, explain that it is not a question of getting fats to make glycerin, but the making of glycerin and disposing of the accompanying products, such as soap. They point out that there is a shortage of storage capacity at the plants, and that in the manufacture of glycerin the other materials have to be used up and a market provided for the by-products, which were the principal products before the war, or else there will be just so much economic waste. The situation in regard to glycerin is now very promising, they say, and no alarm need be felt if the industry continues to cooperate as it has been doing.

The increase in the production of crude glycerin through recovery of grease from garbage seems to be making some progress.

DR. LUCIUS P. BROWN REINSTATED.

Director L. P. Brown, of the New York City Bureau of Foods and Drugs, has been reinstated, which is good proof that the charges against his administration lacked substantiality. One charge against Doctor Brown was in substance that he recognized the ability, efficiency and creditable work of his

assistants, who by their faithful service gave greater latitude for the Director to carry out reforms and broaden the scope of his work of his department. The Board of Health states: "It is fortunate, indeed, that these subordinates were so capable."

Robert P. Fischelis, ex-chairman Section on Commercial Interests, A. Ph. A., is now in the

Chemical Welfare Service of the U. S. Army. He is stationed at the Control Laboratory of the Gas Defense plant, Long Island City, N. Y.

Ensign John Jay Schieffelin, son of Dr. Wm. Jay Schieffelin, was recently commended for his service in directing an American destroyer to a German U-boat. Ensign Schieffelin is pilot of a U. S. seaplane.

SOCIETIES AND COLLEGES.

ENTERTAINMENTS OF THE CHICAGO MEETING A. Ph. A.

It is always a difficult matter to mention all who contribute to the hospitalities and enjoyments of a convention. So the safe plan will be followed in generalization by giving credit for the complete success of this part of the program to Chairman Charles E. Matthews, Local Secretary E. N. Gathercoal and their host of able and splendid co-workers. It should also be said that the good ladies contributed in many ways even to the extent of serving the luncheon on the Municipal Pier and under the auspices of the Chicago Retail Druggists' Association.

The President's reception was followed by a dance and refreshments. Secretary Day introduced the guests and members to President Dohme and Mrs. Charles Matthews, President-elect, and Mrs. LaWall.

The alumni absorbed the spirit of the times and met in one room for the annual banquet. So pleasing was the fraternization that the same idea will likely be continued.

To speak of the Round Table Luncheon in adequate words would require columns instead of the few lines here possible. Corresponding Secretary Wilhelm Bodemann presided and flung typical Bodemann badinage to the assembled and was never at a loss to exhibit the good-fellowship which characterizes the Chicago Veteran Druggists' Association. Charles Matthews was the birthday child. Honorary President O. F. Fuller occupied the seat near to the toastmaster. His welcome to the guests exhibited his geniality and how to be young at eighty.

The automobile drive took the visitors over about 35 miles of Chicago's famous boulevards. The dinner of the evening was presided over by James W. Morrisson as toastmaster and the speakers were Ex-President A. R. L. Dohme, President Charles H. LaWall, Harrison B. Riley and Dr. W. A. Evans.

Music and song added to the enjoyment of the closing event of Chicago's entertainments.

The arrangements throughout were as nearly perfect as possible and even the weather, with the exception of that of the first two days, was delightful.

This brief report would be incomplete without reference to the daily issues of the *Western Druggist*. Appreciation was voiced by the members and shown each morning by their eagerness to secure copies of the publications.

THE REGISTRATION LIST OF THE CHICAGO CONVENTION, A. Ph. A.

Aberwald, F. J., St. Paul.
 Abrahamson, Carl A., and Mrs., Chicago.
 Ahlborn, Frank H., and Mrs., Chicago.
 Anderson, Wm. C., and Mrs., Brooklyn.

OFFICERS OF THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

The new officers and committeemen elected by the National Association of Board of Pharmacy are: *President*, John Culley, of Utah; *Vice-Presidents*, H. G. Ruenzel, of Wisconsin; E. V. Sheely, of Tennessee; and Edward Dorsey, of Kansas; *Secretary*, H. C. Christensen, of Illinois; *Treasurer*, C. H. Skinner, of Vermont; *Executive Committee*, H. E. Purdy, of Connecticut; W. R. Jarrett, of Oklahoma, and Charles Gietner, of Missouri; *Advisory Examination Committee*, H. C. Christensen, Burton Cassady, of Indiana, and Charles Falkenhainer, of Iowa; new member of Syllabus Committee, George W. McDuff, of Louisiana.

THE MEETING OF THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS.

The National Association of Retail Druggists convenes in New Orleans this week. Any one acquainted with the hospitalities of the host city and its many attractions will know that the reception of the members will be warm and the entertainments many and interesting. The essence of association meetings this year is work and the plans have been laid accordingly. We express the hope for a satisfactory attendance.

THE NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

Secretary E. Fullerton Cook, 145 N. 10th St., Philadelphia, has sent out a letter urging cooperation in securing the passage of the Edmonds' Bill. Of particular value are personal letters to Congressmen from medical men and the laity. Signature lists endorsing the proposition are helpful and these can be readily secured if the purpose is explained. Literature and petition blanks can be obtained from Secretary Cook.

The communication reads in part:

"Throughout the entire United States and the world, physicians in private practice have, and are, depending upon the services of trained pharmacists in their administrations to the

sick, and in every European country, where army organization on a large scale has been the study of years, this same coöperation between the physician and pharmacist has been made a feature of the Medical Corps. The men in our army need this complete organization for the best medical treatment, army physicians need the help of pharmacists in the buying, preparing, standardizing, and dispensing of the potent remedies used in the treatment of the sick and wounded, the United States Government has had need, and has been using, trained pharmacists since the beginning of the war, in the buying, standardizing, and manufacturing of these same remedies, and the United States Navy has for many years recognized the necessity for the service of a trained officer, who embraces those qualifica-

tions contemplated for the Army by the Edmonds Bill."

FOURTH INTERNATIONAL EXPOSITION OF CHEMICAL INDUSTRIES.

Rich G. Hollaman, president of the International Exposition Company, has been notified from Washington that in the event of Grand Central Palace, New York City, being taken over by the Government for war purposes, this action will not in any way interfere with the holding of the Fourth National Exposition of Chemical Industries, scheduled to be held in that building September 23-30. That portion of the building required for the exposition will positively not be taken over by the Government until October 1st or later.

THE PHARMACIST AND THE LAW.

THE SALE OF ALCOHOL, DISTILLED LIQUORS, ETC., BY RETAIL DRUGGISTS.

In reply to a letter from this office to the Internal Revenue Service, at Philadelphia, we have received the following information:

1. To sell alcohol as such or beverage alcohol the alcohol must have been distilled prior to September 8, 1917, and the retail druggists must have a license for such sales.

2. To sell non-beverage alcohol the alcohol must be medicated according to one of the eleven formulas prescribed at the time of sale in a quantity not exceeding one pint. For such sales the retail druggists need not have a license, but they must first file a bond with the Revenue Office for the sale of such non-beverage alcohol, medicated according to the prescribed formulas, before making such sales. This bond must be in an amount proportionate to the number of gallons in the druggist's possession at any one time.

The rule set forth in T. D. 2717 prescribes that only the sales of malt extracts containing more than 2 percent alcohol or less than 12 percent solid matter are liable for the payment of special tax. These percentages refer only to malt liquors and not to spirits or wines.

Retail druggists need not pay a special tax of the retail liquor dealer to fill prescriptions containing whisky or brandy unless the said prescriptions are unmixed or unmedicated and fit for beverage purposes.

AMENDMENT TO HARRISON LAW IS PROPOSED BY CONGRESSMAN H. T. RAINEY, OF ILLINOIS.

In presenting amendments to the Harrison Law, Congressman Rainey stated that in the first draft there were 80,000 drug addicts, and that there were 8,800 addicts in New York City. In his further remarks he said that he had the names of 25 physicians, commissioned as captains and majors in the Army who are confirmed addicts; one of them was recently discovered with 50 ounces of opium before starting for France.

Congressman Rainey's bill provides the following:

For the registration of every person who imports, manufactures, produces, compounds, sells, deals in, dispenses or gives away opium, coca leaves or any compound, manufacture of derivative thereof.

That each person so registering shall pay special taxes ranging from \$3 a year for physicians, surgeons, dentists and veterinarians, to \$24 a year for importers, manufacturers, producers or compounders, with wholesale dealers taxed \$12 and retail dealers \$6 per annum.

That an internal revenue tax of 1 cent an ounce or fraction thereof shall be levied upon all such narcotics manufactured in or imported into this country, to be paid by the importer or manufacturer, such tax to be represented by stamps affixed to each package or container. Such tax to be in addition to any import duty.

That violations of the provisions of the act shall be punished by fine or imprisonment, or both.

The draft of the bill provides for the exception of drugs, dispensed by physicians, etc., when exact and definite regulation as to records and other specified data is observed.

At the time of this writing we are not advised relative to the extent of coöperation by pharmacists in constructing the Rainey amendment, or rather of a request for coöperation in preparing it. More frequently than ever before pharmacists are ignored in formulating enactments that largely concern them, contrary to the recommendation of President Wilson relative to seeking the advice of trades and professions that are directly interested in legislation under consideration.

We are not in position to controvert the assertions made by Congressman Rainey relative to the extent of drug addiction discovered by the draft. The statements relative to large quantities of paregoric and other related preparations may not be found so excessive when comparison is made with the number of persons involved. But the point is, pharmacists are most desirous of checking the narcotic evil; the American Pharmaceutical

Association was largely instrumental in urging earlier legislation. There are undesirables in every trade and profession even, as Mr. Rainey indicates, among medical men and, as substantiated by court records. It would seem that physicians who lend themselves to such nefarious practice have just as great an opportunity for illegal dispensing and prescribing under the proposed regulations as under the Harrison Law. They would pay a license of \$3.00, and be under less surveillance than pharmacists who are taxed \$6.00 if not \$30.00.

We are, at this writing, not prepared to give further expression but believe no hasty action should be taken and that Congressmen be importuned for further hearing and give a careful study to the provisions. To that end we advise that druggists everywhere urge delay of the legislation which for some reason is to be pushed through Congress. If then it proves a more effective means for checking traffic and prescribing well, and good. Only recently the confusion which resulted from alcohol legislation evidenced the lack of consultation with those who were qualified to give advice. The Drug Trade Conference should have the opportunity to confer with the promoters relative to this legislation.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

BRITISH PHARMACEUTICAL CONFERENCE.

At the fifty-fifth annual meeting of the British Pharmaceutical Conference the following officers were elected: President, Mr. W. Kirby; vice-presidents, Mr. W. L. Currie, Mr. W. P. Evans, Mr. J. Mitchie, Mr. Edmund White, Mr. G. Whitfield and Lieutenant Colonel E. F. Harrison; treasurer, Mr. D. Lloyd Howard; honorable general secretaries, Captain H. Finnemore and Mr. R. R. Bennett; members of executive, Mr. F. W. Crossley Holland, Mr. A. Deane, Mr. F. W. Gamble, Mr. C. H. Hampshire, Mr. A. R. Melhuish, Mr. H. Skinner, Mr. T. Stephenson, Mr. H. Wyatt, and Professor H. L. Smith; honorable auditors, Mr. W. F. Gulliver and Mr. W. L. Howie.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittance should be made payable to Treasurer H. M. Whelpley but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Request for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be typewritten and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

| SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE. | | | | | | |
|----------------------------------------------------|-------|-------|--------|--------|---------|--|
| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. | |
| 50..... | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 | |
| 100..... | 1.76 | 3.52 | 5.28 | 7.04 | 1.54 | |
| 150..... | 1.98 | 3.96 | 5.94 | 7.92 | 1.82 | |
| 200..... | 2.20 | 4.40 | 6.60 | 8.80 | 2.09 | |

Orders may be sent to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1918-1919.

President—Charles H. LaWall, 30 South 10th St., Philadelphia, Pa.

Honorary President—Oliver F. Fuller, 540 W. Randolph St., Chicago, Ill.

First Vice-President—F. W. Nitardy, 66 Orange St., Brooklyn, N. Y.

Second Vice-President—Theodore J. Bradley, 70 St. Botolph St., Boston, Mass.

Third Vice-President—Francis Hemm, 2108 Locust St., St. Louis, Mo.

General Secretary—William B. Day, 701 So. Wood St., Chicago, Ill.

Treasurer—Henry M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Reporter on the Progress of Pharmacy—H. V. Army, 115 West 68th St., New York, N. Y.

Editor of the Journal—E. G. Eberle, 253 Bourse Bldg., Philadelphia, Pa.

Local Secretary—Hugo H. Schaefer, 115 West 68th St., New York, N. Y.

Chairman of the Council—Lewis C. Hopp, 1104 Euclid Ave., Cleveland, Ohio.

Secretary of the Council—J. W. England, 415 North Thirty-third St., Philadelphia, Pa.

OLIVER FRANKLIN FULLER
CHICAGO, ILL.

Seventy-five years in the drug business—forty-nine years a member of the American Pharmaceutical
Association

Honorary President of the American Pharmaceutical Association 1918–1919

O. F. FULLER

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

OCTOBER, 1918

NO. 10

OLIVER FRANKLIN FULLER.

The Honorary President of the American Pharmaceutical Association for 1918-1919 is O. F. Fuller, of Chicago, Ill. Although only a decade of years from the centennial of his birth, he maintains an active interest in the drug business and in general affairs.

System printed an interview with Mr. Fuller in which he spoke of the changes and progress of the drug industries during the past seventy years, stressing that specialization had brought many modifications in the conduct of the business and, as a result, those engaged were well qualified in their specialty but did not acquire the general information possessed by pharmacists of an earlier day. He remarked on the fewer hours of daily work and pointed out the danger that if the free hours were not used for learning about the related tasks, which formerly belonged to the business, druggists would find that their specialty was no longer wanted or needed by society. "Then," he said, "we will be out of a business or a job with no useful money-making knowledge or training."

Mr. Fuller was born in 1829, at Sherman, Connecticut, where he received his schooling until fourteen years of age, when he entered the retail drug business in Peekskill, N. Y. Here he remained until he reached his majority, when he came to Chicago, then a frontier town. He had saved \$500.00, his father added a like amount, and with this as part of the investment the retail drug business of Fuller & Roberts was established, which is represented to-day in the wholesale drug firm of The Fuller-Morrisson Company.

In the interview referred to Mr. Fuller said: "Friends ask me 'Why don't you take a rest?' I still come down to the desk because I want to keep my mind busy—men usually don't live long after they retire and let their minds drift—because I want to see business pass new milestones in its development * * * But let us stop every now and then to look beyond the constantly narrowing limits set by the specialization which typifies to-day. It may be that we old men are too conservative for to-day's business. But the decades often carry a wise lesson."

Mr. Fuller is deeply interested in the Chicago Veteran Druggists' Association; he has helped to make history in Chicago, planned and labored in its earlier

development, passed through the experiences of the Civil War, the visitation of the great Chicago fire, and still participates in the activities of the country's second largest city.

Mr. Fuller was married in 1858 to Miss Phoebe L. Shipley, of Peekskill, N. Y.; she died a number of years ago; in 1910 he married Miss Becky Seacord, whom he had known from early girlhood.

In acknowledging Secretary William B. Day's letter, advising him of his election as Honorary President of the American Pharmaceutical Association, Mr. Fuller wrote:

"Your communication, informing me of the high honor conferred on me by the American Pharmaceutical Association, in the recent Convention, has reached me.

"It is with very real pleasure that I write to thank the Society through you, the Secretary, for the compliment accorded me on this the forty-ninth anniversary of my membership in the American Pharmaceutical Association. I feel the honor not only to be a personal one, but that by my being chosen as the recipient of this honor the Chicago Veteran Druggists' Association is receiving complimentary recognition.

"With sincere appreciation of the kindly thought which prompted the action, I am

Most sincerely yours,

(Signed)

OLIVER FRANKLIN FULLER."

PHARMACY AND THE DRUG STORE.

IT can probably be said that failure, thus far, to secure the establishment of a pharmaceutical corps in the U. S. Army, after persistent and systematic efforts on the part of pharmacists, and an evident indifference on the part of Army medical men to coöperate strongly for such creation, impressed several papers of the American Pharmaceutical Association on "the separation of pharmacy from the drug business," and the same subject formed the keynote of the presidential address before the recent meeting of the American Conference of Pharmaceutical Faculties; it also influenced the report of the Committee on "Short Course Schools," of the latter organization. It is true that the incompatibility of pharmacy with many drug stocks has long been recognized, that a distinction of classes has been and is effective in some European countries, but the subject has never before been the important theme of a convention of American pharmacists.

Efforts to establish standards of respectability, or relationship between pharmacy and the side-lines of the modern drug store constitute a mistake; such comparisons are, as a rule, either unjust or unnecessary. The point simply is that pharmacy is a profession, but this does not characterize every transaction of the store. Success in a business or profession is of utmost importance; integrity and honesty are essential in both. The pharmacist, as well as the druggist, should know the fundamentals of business; experience and good common sense teach proper application of them. Pharmacy may be practiced rightly in a store wherein the sales in side-lines represent the larger volume of the business; it may be mal-practiced where only prescriptions are filled and drugs are sold. Pharmacy and the drug business reflect the man within.

Colleges of pharmacy can readily arrange their curricula and entrance requirements for the teaching of druggists and pharmacists, but they must adapt them so that they will prepare the students for their life-work. Thoroughness is an essential qualification of a druggist and pharmacist; right dealing is as mandatory in a drug store as in a pharmacy; an inefficiently trained pharmacist is not a druggist, the difference is not of degree. The opportunities for service and success are just as great in the drug business as in pharmacy; both engagements are honorable, if rightly conducted.

The present is a most opportune time for studying the practicability of establishing drug stores without pharmacy departments, because of the shortage of pharmacists; we are inclined to think that this can be brought about much more

rapidly than the separation of pharmacies from drug stores. Relatively more drug stores will be able to exist than exclusive pharmacies, which implies that in many drug stores the pharmacy departments are not productive of large direct profit. "Let us face the facts." The medical profession must become sincerely interested in the movement of developing pharmacy if the proposed plan of separating pharmacy from the drug store is to gain momentum; medical men should exhibit a far more intense interest than has so far been shown to further the efforts of pharmacists for professional recognition. They will find that the progress of pharmacy is essential to the continued advancement of medicine, or the trend may be a return to the apothecary-physician.

A reflection on the development of the modern drug store reveals that manufacturing pharmacy gave pharmacists the opportunity to increase the volume of their sales by adding sundry lines, until in many stores pharmacy became a subsidiary adjunct. The patrons failed to realize fully the value of the service rendered by the drug stores; no matter how small the sale, it was for profit in their estimation, even if it was of a postage stamp. More seriously, the public regarded the sales by pharmacists on a par with those of department store competitors; thus these became largely merchants and medicines became merchandise. Legal enactments did not greatly extend the pharmacists' privileges; medicines were sold by them under restrictions, while others sold them without legal subjection; physicians continued to dispense.

If pharmacy is to receive full recognition as a profession it must be proven that prescribing and dispensing of *materia medica* are different and not interchangeable functions, and that medicines should be prescribed to fit the case. A pharmacy should be provided with laboratories, and bacteriological products should be intelligently handled, and finally, as with other professions, pharmacists should exact a fee for professional services. These are some of the things that must be considered in framing pharmacy legislation, applicable to the change of status which has been proposed. The subject is important and deserving of serious consideration, so that the foundation for both types of drug stores may be properly laid and the two classes defined. The number of drug stores will probably soon exceed that of exclusive pharmacies, but the increase of both will likely be by elimination within established stores; on the one hand, by doing away with the prescription department and related stock, and on the other, by the installation of a laboratory, eliminating certain of the side-lines and the inclusion of others. We do not venture to predict how rapid this progress will be.

"Progress begins with the minority. It is completed by persuading the majority, by showing the reason and the advantage of the step forward, and that is accomplished by appealing to the intelligence of the majority."—*George William Curtis*.
E. G. E.

THE MENACE OF THE "PLUGGING" SCHOOL.

FAR too little attention has been given to the "plugging" institution in the past. The fact has come home to us since the entrance of the United States into the war, for, whatever else may stand in the way of recognition of pharmacists by the Government, *one* of the difficulties is the inadequate preparation of many so-called pharmacists.

There is a wide difference in the requirements of Conference colleges as well as the product which they turn out but when one considers these other institutions, which do not even deserve the title of school, the difference becomes vastly greater. For some years a score or more of these so-called schools have been in existence. The number of young men and women, who have prepared for board examinations by spending from six weeks to three months in one or the other of them, runs into the thousands. They can enter with no preliminary education whatever and, when they have passed a board examination, they are free to practice on an unsuspecting public.

Standard colleges have probably shown too much indifference. So far as harm to the college itself is concerned they might be ignored because few who are attending them could be admitted to a college. However, that is altogether too self-centered and short-sighted an attitude to take. Besides the liability to error due to incompetence and the consequent menace to the public, these people obtain their registration with such small expenditure of time and labor and money that they are willing to work for much smaller remuneration than college-trained men and this results in a competition that is quite unfair. In some states a class of men have been attracted to this as a means of getting the necessary document that would permit them to operate a business of more or less questionable reputation in the guise of a drug store, thus adding another disagreeable feature to the competition. Now we are beginning to comprehend the fact that these institutions have had much to do with the attitude of other professional people in contending that pharmacy is solely a business.

Prerequisite laws have been enacted in several states but the movement has been far too slow. It is high time that we waken to the danger of permitting these institutions to exist longer. No fear need be felt that an insufficient number of young men and young women will take up the study of pharmacy to supply the necessary helpers. It doesn't work that way. It has been demonstrated conclusively that real pharmacy attracts a greater number and a superior class of young people when they know that they are not to have the competition of untrained workers and that they will be associated with men and women who have ideals and a higher valuation of the services of pharmacy. ZADA M. COOPER.

SCIENTIFIC SECTION, AMERICAN PHARMACEUTICAL ASSOCIATION.

ABSTRACT OF THE MINUTES OF THE SESSIONS HELD IN CHICAGO, ILL., AUGUST 14,
15 AND 16.*

Owing to the absence of the officers, the first session of the Scientific Section, A. Ph. A., was called to order by A. H. Clark of Chicago, Wednesday, August 14, at 9:30 A.M. Nominations for temporary Chairman and Secretary were called for; there being only one nominee for each office, Edward Kremers of Madison, Wis., and A. G. DuMez of Washington, D. C., were respectively elected Chairman and Secretary of the Sessions.

Address of Chairman W. W. Stockberger:

TO THE SCIENTIFIC SECTION, A. PH. A., CHICAGO MEETING, 1918:

Your Chairman regrets exceedingly that active duties in Washington render it impossible for him to attend the meeting of the Scientific Section and to discharge in person the responsibility with which he has been honored by you. The program is crowded with the titles of papers by members who are present with the expectation of reading them before you, and under the circumstances it seems quite inappropriate for the Chairman to submit a formal address to be read through the courtesy of some member of the Section. However, there is one important matter which your Chairman wishes to lay before you, and that is the desirability of taking definite steps to stimulate to the utmost, research on botanic drugs. In the case of several plant drugs it has recently been shown that the traditional methods for their collection and preparation do not produce a drug of the highest therapeutic value. Upon thorough investigation it is highly probable that the number of plant drugs for which the same is true will prove to be surprisingly large. The conditions arising as a result of the war have greatly stimulated drug growing in this country and no good reason exists for the failure to insist upon suitable control measures in connection therewith in order that the drugs produced may be of standard quality. However, further research is necessary to establish the most desirable methods to use in collecting and preparing the product for the manufacturer.

The shortage in American botanicals has developed another phase of this question. Quite recently a crude drug firm has circularized every State Department of Agriculture in the country, requesting that publicity be given to the desirability of collecting indigenous drug plants. This may result in the collection of a vast amount of material by persons who have no accurate information regarding proper methods of collection and preparation, and perhaps none at all regarding the effect of wrong treatment upon the value of the material itself. The labor situation, also, is causing additional changes in the personnel of the collectors, and the need is therefore great for definite information on all phases of drug collection, compiled in simple form and made available for wide distribution. This unusual opportunity to improve the standard of quality of our native crude drugs should not be overlooked.

Although a vast amount of labor would be required, it is believed that the determination of all the factors which favorably or unfavorably affect the intrinsic value of the more important botanicals, would yield results of great significance. The logical place to carry on the line of research here indicated would seem to be in our colleges of pharmacy. Already about twenty of these institutions have established drug gardens which will afford much of the necessary material. In addition many native botanicals are within easy reach of almost every one of these colleges. Quite apart from its general scientific value, the type of research under discussion would enrich and facilitate the educational work of the colleges and bring to them recognition as centers of specific and reliable information regarding botanic drugs cultivated or collected in the region where they are located.

These suggestions which especially relate to the highly important vegetable *materia medica* are respectfully submitted for your consideration.

W. W. STOCKBERGER,
Chairman.

Washington, August 9, 1918.

On motion the Chairman's address was received for publication in the minutes of the Section.

* Papers with discussions will be printed apart from the minutes

Reports of Committees were called for: Chairman Frank R. Eldred of the Committee on Ebert Prize, asked for further time, which was granted; the report of the Committee on the Quality of Medicinal Products was received. (The introductory of the report is printed on p. 817, September issue, JOURNAL A. PH. A.) The report of the Committee on Drug Cultivation follows:

REPORT OF COMMITTEE ON DRUG CULTIVATION.

At the meeting of this Association held in 1917, the Scientific Section adopted a motion to appoint a Committee to promote coöperation in matters relative to the cultivation of drugs, and to encourage the dissemination of uniform information concerning this subject. Dr. W. W. Stockberger was appointed Chairman of this Committee, and authorized to select four additional members of the Committee. Upon request, Dr. F. J. Wulling, Dr. Edw. Kremers, Dr. F. B. Kilmer, and Prof. A. W. Linton consented to serve.

No meetings of the Committee have been held, but the Chairman has kept in touch with the other members by correspondence. On account of the positions held by them, each member of the Committee receives a voluminous correspondence regarding the cultivation of plant drugs, and through this medium it has been possible to enlighten thousands of inquirers who, from statements in the public press and often through agricultural and other societies, had obtained the impression that there was a vast fortune awaiting them in the cultivation of drugs. During the year the Chairman has delivered a number of illustrated lectures on drug growing, and on each occasion has endeavored to inculcate the idea that the cultivation of drugs for profit is a serious business proposition which is subject to even greater difficulties and risks than most agricultural enterprises.

Since our last meeting there have appeared in the pharmaceutical press and elsewhere several articles which parallel the line along which this Committee is working. Some of them are as follows:

Army, L. W., "Is Drug Plant Growing Practical?" *Garden Magazine*, Dec. 1917.

Farwell, O. A., "The Cultivation of Medicinal Plants." *Druggists Circular*, Apr. 1918.

Fuller, H. C., "Shall the Amateur Attempt to Grow Drugs?" *Druggists Circular*, Jan. 1918.

Kraemer, H., "Medicinal Plants—Present and Future Supplies." *Am. Jr. Phar.*, 90. No. 6, 1918.

Stockberger, W. W., "Some Plain Facts about Drug Cultivation." *Druggists Circular*, Mch. 1918.

Stockberger, W. W., "Production of Drug Plant Crops in the United States." *Yearbook, U. S. Department of Agriculture*, 1917.

Among the numerous individuals who manifest an interest in drug cultivation, several classes may be distinguished:

First, and by far the largest class, those who, without experience, expect an enormous profit with a minimum of effort—they should be disillusioned.

Second, physicians or pharmacists who wish to grow drugs in an experimental way for their own information or recreation—they should be encouraged.

Third, educators in our Colleges of Pharmacy who are interested in increasing their educational facilities—they should have our hearty support.

Fourth, those who are engaged in this work in a large and systematic way on a definite business basis—they should have our active coöperation and assistance.

It should be evident to all that the indiscriminate "boosting" of drug cultivation will ultimately result only in disaster. In our desire to foster drug growing in this country, we should not fall into the error of overestimating its relative importance in comparison with other agricultural enterprises. Notwithstanding the fact that the cultivation of certain valuable drugs now seems desirable and necessary, we must remember that the demand is and will continue to be relatively limited. If this industry is to be developed on a sound commercial basis and be in position to meet the competition which it seems certain may be expected after the war, its limitations must be recognized and the necessary steps taken to insure its continuance along rational lines. The respective interests of the producer, dealer and manufacturer must be much better coördinated if drug cultivation in this country is to progress in the face of changed commercial conditions. Our duty to our country makes it imperative that we forestall any

future situation in our drug supply, such as that which obtained at the beginning of the war in 1914, by giving our individual support to an enterprise which affords a practical means of developing supplies of drugs in national emergencies as well as in times of peace.

Respectfully submitted,

W. W. STOCKBERGER,
Chairman.

Washington, D. C., August 8, 1918.

The report was referred for publication in the minutes of the Section.

The following papers were read and referred for publication:

"Effect of the War on Drug Importation" (illustrated), by C. L. Alsberg and C. O. Ewing.

"Couch Grass *vs.* Bermuda Grass" (illustrated), by E. N. Gathercoal.

"Histology of Brazilian Jalap" (illustrated,) by O. A. Farwell.

"Brazilian Jalap," by W. L. Seoville. (See p. 785, September issue of the JOURNAL A. PH. A.)

"*Piptostegia Pisonis*," by C. O. Ewing.

"Fluidextract of Squill," by R. I. Grantham and H. C. Colson, Jr.

"Variations in Cinchona Bark and Its Preparations," by Hugo H. Schaefer.

Nominations were presented by the Nominating Committee.

The following papers were read and referred for publication:

"Research and the U. S. Pharmacopoeia," by A. H. Clark.

"Assay of Hypophosphites," by J. P. Snyder and J. K. Dickerson.

The first session of the Scientific Section was then adjourned.

SECOND SESSION.

The second session of the Scientific Section, A. Ph. A., was called to order by Chairman *pro tem* Edward Kremers at 2.00 P.M., Thursday, August 15. The following papers were read and, after discussion, referred for publication:

"Tablets for the Disinfection of Drinking Water," by Bernard Fantus.

"Tethelin, the Growth-controlling Principle of the Anterior Lobe of the Pituitary Body," by R. P. Fischelis.

A paper by the same author on Bismuth Emetine Iodide was read by title.

The following papers were read, discussed and referred for publication:

"Analysis of Tablets of Unknown Composition, an Example," by L. F. Kebler.

"Standardization of Fiftieth Normal Potassium Hydroxide," by W. J. Thompson and J. P. Snyder.

"Commercial Cultures of Bulgarian Bacillus," by E. B. Carter.

The second session of the Scientific Section was then adjourned.

THIRD SESSION.

The third session of the Scientific Section, A. Ph. A., was called to order by Chairman *pro tem* Edward Kremers, Friday, August 16, at 9.30 A.M.

Chairman F. R. Eldred of the Committee on Herbert Prize reported that the Committee had decided that none of the papers of last year's meeting met the requirements under which the prize is to be awarded, and therefore no recommendation for award was made. The Section approved of the report.

The following papers were read and, after discussion, referred for publication:

"The Commercial Growing of Some European Drugs," by E. L. Woodhams.

"Description of a Trip through the Drug Raising Area of the South—An Illustrated Lecture," by C. O. Ewing.

"Criticisms and Comments on N. F. IV," by Jacob Diner.

"Nitrogen, a Dominant Factor in the Affairs of Man," by L. F. Kebler.

"The Effect of Alcohol on the Activity of Liquor Hypophysis," by Paul S. Pittenger.

"The Deterioration of Tincture of Digitalis," by Paul S. Pittenger.

"Some Experiments on Rhythmic Precipitation" (illustrated), by Curt P. Wimmer.

The following papers were read by title and referred for publication:

"Problems of the Manufacture of Medicinal Chemicals, Directly Resulting from War Conditions," by B. L. Murray.

"Problems of the Manufacturing Pharmacist, Directly Resulting from War Conditions," by C. H. Briggs.

"An Unusual Oil from *Monarda Punctata*," by Max Phillips.

"The Volatile Oil of Canada Balsam," by Max Phillips.

"Camphene in Hemlock Oil," by E. V. Lynn.

"Ozonides and Peroxides of the Terpenes as Therapeutic Agents," by E. V. Lynn.

"Oleoresin of *Pinus Ponderosa*," by E. R. Miller and E. V. Lynn.

ELECTION OF OFFICERS.

The election of officers resulted as follows:

Chairman, E. N. Gathercoal, Chicago, Ill.

Secretary, Hugo H. Schaefer, New York, N. Y.

First Vice-Chairman, C. B. Jordan, Lafayette, Ind.

Second Vice-Chairman, C. O. Ewing, Washington, D. C.

The officers were installed and Chairman Edward Kremers thanked the members for their coöperation, and expressed his opinion that the work accomplished and papers presented were eminently satisfactory. Chairman E. N. Gathercoal, in assuming the office, thanked the members for the honor conferred on him by the election. A vote of thanks was tendered the temporary officers, and thereafter the Scientific Section adjourned.

THE EFFECT OF ALCOHOL ON THE ACTIVITY OF LIQUOR HYPOPHYSIS.*

BY PAUL S. PITTINGER.

Through the statements of the salesmen of one of the large manufacturers of glandular products the impression has become quite general that traces of alcohol destroy the physiologic action of liquor hypophysis.

In other words, they claim that very often when the physician does not obtain the desired results from an injection of liquor hypophysis, the failure is due to the fact that the physician sterilized the hypodermic syringe with alcohol and that the small amount of alcohol left in the syringe destroyed the action of the extract.

As the above statements are made without the support of experimental data I concluded to carry out a series of experiments in order to determine whether or not small amounts of alcohol would influence in any way the activity of the extract as shown by tests upon the blood pressure and the isolated uterus.

The experiments were carried out in two different ways. In some of the experiments the syringe was first washed out with alcohol after which the extract was drawn up into the syringe, and then immediately injected. In the rest of the experiments a small quantity of alcohol was added to the extract and the solution allowed to stand one-half hour before injecting.

The results of eight experiments upon the isolated uterus and of ten experiments upon the blood pressure show that in every case exactly the same effects

* Read before the Scientific Section, A. Ph. A., Chicago meeting, 1918.

were produced by the extract to which the small amount of alcohol had been added, as were produced by the plain extract.

FIG. 1.—Shows that small amounts of alcohol do not influence the activity of liquor hypophysis upon the isolated uterus. A.—0.025 mil liquor hypophysis. B.—0.025 mil liquor hypophysis to which has been added 0.05 mil alcohol.

FIG. 2.—Shows that small amounts of alcohol do not influence the effects of liquor hypophysis upon the blood pressure. A.—0.2 mil liquor hypophysis. B.—0.2 mil liquor hypophysis to which has been added 0.05 mil alcohol.

Conclusion.—Small amounts of alcohol do not destroy the physiologic activity of *Liquor Hypophysis*.

PHARMACODYNAMIC LABORATORY,

H. K. MULFORD CO.,

July 1918.

BRAZILIAN JALAP AND SOME ALLIED DRUGS.*

BY OLIVER ATKINS FARWELL.

In the *Pharmaceutical Journal* for November 27, 1915, Mr. E. M. Holmes described a root known as Brazilian Jalap, which he refers to the *Piptostegia Pisonis* Mart. This species was described by Martius in his *Systema Materia Medica Brasiliensis*, page 78, in 1843. In addition to this and the typical species, *P. Operculata* Reichb., Martius described and listed *P. Gomesii*. In the *Flora Brasiliensis* Meisner reduced the latter to the limbo of synonymy, placing it under *Operculina Convolvulus* but made no mention of *P. Pisonis*; since this so-called species was not mentioned in the *Flora Brasiliensis*, the inference to be drawn therefrom is that it was thought to be invalid, just a synonym of *O. Convolvulus*. At different times this species has been included under *Convolvulus* or *Ipomoea*, but at present it is considered to constitute a genus distinct from either, the oldest

* Read before Scientific Section, A. Ph. A., Chicago meeting, 1918.

name for which is *Operculina*. If my deductions as above outlined are correct the proper binomial for the Brazilian Jalap is *Operculina macrocarpa* (Linn.) Urban. The names under which this drug is commonly known in Brazil are *Batata de Purga* and *Batata purgante*. *Tapioco de Purga* is a product derived from the root. The generic characters of *Operculina* are the pear-shaped calyx, large imbricated sepals chartaceous in fruit, broadly campanulate corolla tube, and the twisted anthers. The plant is a climbing shrub with winged stems, palmately 3-7-divided leaves,

BRAZILIAN JALAP AND SOME ALLIED DRUGS.

peduncles about as long as the leaves and white campanulate flowers. Mr. Holmes described the root as follows:

"The root occurs in commerce in the form of transverse circular sections averaging about $1\frac{1}{2}$ -2 inches in diameter, and about $\frac{1}{4}$ inch in thickness, marked with several concentric rings, and, save for its pale grayish brown tint and the presence of numerous dots of translucent pale resin on the surface, bears considerable resemblance to White Bryony root."

An effort was made to obtain a small supply of the root; in due course of time it was procured from London. It agreed in all points with the description quoted above. We may add, however, that it has a thin dark brown or blackish brown

cork, the surface is not fibrous, and that the phloem and cambium are shrunken below the surface of the xylum and cortex; that its resemblance to the cross-sections of Mexican Scammony or of Poke is as equally, if not more, pronounced as to that of White Bryony.

The root probably is a large tuberous root and is composed chiefly of soft tissues. The cambium forms complete circles and together with the phloem are, in the commercial drug, noticeable as dark concentric circles shrunken a little below the level of the surrounding tissues. In the sections observed, the tissues were all of secondary growth; that is, spiral or annular tracheae usually associated with primary meristem could not be detected. The center of the root in the smaller sections is nearly solid xylum, there being four narrow strands of secondary cortex, thus making the structure of the root a tetrarch. The larger sections are very similar but may have less xylum and more cortex. The cambium of the collateral bundles soon ceases its activity and the cortex gives rise to another meristematic region beyond the phloem and this operation is continued repeatedly, producing in this unusual way its growth in thickness. The xylum forms a very small bundle of few vessels and these are rather widely separated, forming an interrupted circle with wide spaces between the bundles. The medullary ray is usually one cell, sometimes two cells, in width. The vessels of the bundle are reticulated tracheae, often 0.13 mm. in diameter with walls 0.008 mm. thick, and these constitute the greater portion of the strengthening tissue of the root; tracheides and wood fibers are frequent in the central circles but absent or only occasional in the outer ones. Rosette crystals of calcium oxalate are frequent just internal to the cork, scattered through the cortex, and form crystal fibers close to the xylum. Starch is present only in a very small amount; the grains are simple and range from 0.002 mm. to 0.024 mm. in diameter. Bast fibers are absent or at least were not detected; but most of the bast parenchyma and some of the cells of the medullary rays and secondary cortex, while retaining comparatively thin walls, are stained brown with chloro-iodide-of-zinc, indicating suberization or cutinization. The cells of the cortex are more or less polygonal and average about 0.044 mm. in diameter, the walls are thin and the air space between the cells is very small. The cork layer is about 0.123 mm. thick and is composed of a series of thin-walled, more or less tabular cells (0.008 mm. by 0.048 mm.), only the outermost series having thickened cell walls. The tracheides average about 0.44 mm. in length, 0.026 mm. wide, and have a wall about 0.003 mm. in thickness. The wood fibers have oblique pores and range from 0.62-0.78 mm. in length, 0.013-0.020 mm. wide, and have a lumen varying from $\frac{1}{5}$ - $\frac{3}{4}$ the width of the fiber.

RESINA DRASTICA.

The drug that has come to us under this name is of unknown origin. It comes in both transverse and longitudinal sections of the root, the color is a dirty brown or dark grayish brown, much darker than the Brazilian Jalap. In the cross-sections the wood strands project as much as 2 mm. beyond the surface giving a rough fibrous aspect to the section; the bundles are irregularly scattered through definite concentric zones. In the longitudinal sections the strands appear on the surfaces as smooth ridges in more or less parallel but interrupted lines and frequently extend beyond the end of the section as coarse fibers up to 3 cm. in length

and 3 mm. in thickness. From the general resemblance of this root to that of Brazilian Jalap and to that of Mexican Scammony, I would hazard the guess that it is from some plant closely allied to them and consequently from the morning glory family, the *Convolvulaceae*.

W. L. Scoville, who is working out the chemistry of the drug, has informed me that in so far as he can tell from the limited amount of work he has been enabled to give to it, it does not differ materially from the resin of Mexican Scammony except in its yellow color. Under the microscope the root structure differs from the Brazilian Jalap in having no rosette crystals or crystal fibers, in having a superabundance of starch, the grains being of a more uniform size of from 0.013 mm.—0.018 mm., the vessels being chiefly of the pitted type, wood fibers are plentiful and there is some bast fiber. In Brazilian Jalap, oil with refractive inclusions, perhaps oleoresin, was scarce and where present was arranged in masses, rather than in drops, in longitudinal lines, mostly in connection with the medullary ray cells; but most of the cells of the samples I had for examination were empty, while on the other hand in the *Resina Drastica* samples the cells were well filled with the products of metabolism and as in the case of the starch there was a superabundance of large drops of oil with its inclusions throughout the cortex. Wood fibers in this drug measure for the most part from 0.704 mm. to 0.892 mm. in length, about 0.02 to 0.03 mm. wide, the lumen being about $\frac{1}{3}$ the width of the cell.

MEXICAN SCAMMONY.

This drug is derived from the large tuberous roots of *Ipomoea Orizabensis* (Pell) Ledenois and is also known as Male or Orizaba Jalap. It resembles very closely the drug described above as *Resina Drastica*, but is somewhat lighter in color, extremes being as light on one hand as the Brazilian Jalap and as dark on the other as *Resina Drastica*; it is as fibrous as the latter but the strands usually are finer, sometimes longer, more numerous, and arranged more regularly in concentric circles or zones. Under the microscope it differs in no tangible way from the *Resina Drastica*. The resin obtained from this is black; whether or not the difference in the colors of the resins of this and of the *Resina Drastica* can be correlated with specific difference in the plants producing them can not now be determined.

DEPARTMENT OF BOTANY,
PARKE, DAVIS & CO.,
DETROIT, MICH.

PIPTOSTEGIA ROOT, PIPTOSTEGIA PISONIS MART., SO-CALLED "BRAZILIAN JALAP."*

BY CLARE OLIN EWING AND JOSEPH F. CLEVINGER.

An importation recently offered for entry as "Jalap" proved, upon investigation, to be the root of *Piptostegia Pisonis* Mart., which Holmes¹ refers to as "the ordinary jalap of Brazil." We are also in receipt of a personal communication from Mr. H. M. Curran, a forester in Brazil, in which he quotes a Bahai druggist

* Contribution from Pharmacognosy Laboratory, Bureau of Chemistry, Department of Agriculture, Washington, D. C.

¹ "Brazilian Jalap," *Pharm. J.*, 95, 671 (1915).

as stating "that it is jalap of this region." The product, however, is not a true jalap, and we have preferred to call it *Piptostegia* root, in order to avoid, if possible,

FIG. 1. *Piptostegia Pisonis* $\times 1/2$

ble, a confusion of names in the trade, such as exists, for example, in the case of Scammony and the so-called Mexican Scammony. *Piptostegia* root occurs in commerce in the form of transverse circular or oval sections, varying from about 3 to 8 cm. in diameter and from about 0.3 to 0.8 cm. in thickness. The pieces are marked with several concentric rings, and, aside from the pale grayish brown tint and the presence of numerous dots of translucent pale resin on the surface, bear considerable resemblance to commercial white bryony root (Fig. 1). Holmes has already (1915) noted the appearance of this drug upon the English market, and has stated that "Brazilian jalap has evidently for some time past been imported into Germany as cheap source of jalapin—i. e., the portion of jalap resin which is insoluble in ether." Experiments made upon his sample by Passmore showed "over 20 percent of resin answering to all of the B. P. and

U. S. P. (VIII) tests for the resin of true or Vera Cruz jalap, but only 0.85 percent is soluble in ether." Holmes concludes that: "As a source of jalapin (resin of jalap insoluble in ether) it is therefore twice the value of the Vera Cruz jalap, since it contains twice the standard quantity of resin required by the B. P."

Some preliminary experiments, while confirming Passmore's report as to the resin content of *Piptostegia Pisonis*, and indicating that the drug possesses considerable cathartic power, yet show clearly that the resin is quite dissimilar to that of jalap, and that the term "jalapin" is incorrectly applied to it.

According to Power and Rogerson¹ "the chief portion of jalap resin which is insoluble in ether" is "commonly designated as 'convolvulin,'" although "in English pharmacy the portion of jalap resin which is insoluble in ether is still frequently designated by the original and more appropriate name 'jalapin.'" The latter term, however, is now more commonly employed to denote the resin of Scammony and of Mexican Male jalap (*Ipomoea Orizabensis* Ledanois), both of which are largely soluble in ether. The resin of *Piptostegia* root, it is true, is mostly insoluble in ether, but the following experiments clearly demonstrate that the term "jalapin," indefinite as this term is, is improperly applied to it.

Ten grammes of *Piptostegia* root in No. 60 powder, when assayed by the U. S. P. method for jalap, yielded 2.3 grammes of resin, or 23 percent. A larger amount of the resin was then prepared according to the U. S. P. method for the preparation of resin of jalap. The product was light tan colored, amorphous powder

¹ "Chemical Examination of Jalap," *J. Am. Chem. Soc.*, 32, 86 (1910).

which complied with all the U. S. P. requirements for resin of jalap, with the exception of a slightly excessive acidity and the formation of a dirty greenish solution in five parts of ammonia water (10 percent). It may, furthermore, be distinguished from the resin of jalap by means of the specific rotation of the respective purified resins, as suggested by Guignes¹ and by means of the method of fractional extraction with various solvents, as employed by Power and Rogerson in their work on various convolvulaceous resins.

The specific rotation of the resin of *Piptostegia* root, purified by treatment with animal charcoal according to the method of Guignes, proved to be -48.5° , whereas that of true resin of jalap is reported to be in the neighborhood of -36° or -37° .²

Further confirmation that the resin from *Piptostegia* root is not identical with that obtained from jalap, was obtained by a fractional extraction of the resin according to the method followed by Power and Rogerson in their work upon a number of convolvulaceous resins. For the purpose of comparison our results are tabulated, together with those obtained by Power and Rogerson in their examination of resins of jalap (*Exogonium purga* Benth),³ scammony (*Convolvulus scammonia* Linne),⁴ "Mexican Scammony" (*Ipomoea Orizabensis* Ledanois),⁵ and common morning glory (*Ipomoea purpurea* Roth),⁶ all of which contain active purgative resins.

PROPORTION OF RESINS EXTRACTED BY VARIOUS SOLVENTS, AND SPECIFIC ROTATION OF THE PURIFIED RESINS.

| | <i>Piptostegia</i> Root. | Jalap. | Scammony. | Mexican Scammony. | Morning Glory. |
|----------------------------------------------------------|-----------------------------|-----------------|------------------|----------------------|-------------------|
| Petroleum (b. p. 40° - 60°) | 2.1% | 1.9% | 4.5% | 6.2% | 8.0% |
| Ether | 5.4% | 9.7% | 92.5% | 64.8% | 7.3% |
| Chloroform | 73.4% | 24.1% | 0.4% | 0.6% | 9.8% |
| Ethyl acetate | 14.2% | 22.0% | | 24.8% | 23.8% |
| Alcohol | 4.7% | 38.8% | 1.8% | 2.3% | 49.0% |
| Specific rotation | -48.5° | -37.0° | -19.87° | -23.05° | -50.95° |

An inspection of the above figures shows the dissimilarity of the resin of *Piptostegia* root from all the other convolvulaceous resins noted, the proportion extracted by chloroform being especially remarkable.

One-half gramme and one gramme samples of the crude resin were submitted to Dr. Schwartze, of the Pharmacological Laboratory of this Bureau, who administered them to two dogs, weighing about 15 kilos each. The larger dose produced emesis after about three-quarters of an hour, the dog showing no other symptoms, and no cathartic action was obtained. The other dog, however, retained

the smaller dose, which produced catharsis within about four hours, the movements continuing for two days at about the rate of two or three per day.

Although lack of sufficient material has prevented us at the present time from making an extensive chemical study of this resin, similar to the investigations by Power and Rogerson of the other convolvulaceous resins noted above, we have deemed the facts thus far obtained to be worthy of record, inasmuch as they may serve to bring to the attention of the pharmaceutical and medical professions in this country a source of a new cathartic convolvulaceous resin of promising usefulness.

BORAX AND BORIC ACID.*

BY H. L. HARRIS.

The early history of borax is vague and uncertain. The word is of Arabic origin, and, as far as known, dates back only to the seventh century. Borax first came from the East. It is believed by many that it was brought by caravan from beyond China by way of Babylon and Palmyra to the Mediterranean ports, before the Christian era.

Sir Edward Bulwer Lytton, in "The Last Days of Pompeii," bears testimony to the value of borax in the days of the Republic. "Borax," says Sir Edward, "was largely used by Nero and his slaves nearly 2,000 years ago and Pansa deeply regretted that he was not rich enough to buy borax to cover the arena after the death of the combatants in the fight between Lydon and Tetrades."

It is only within the last three centuries that the chemical nature of borax has been understood. The green flame imparted to alcohol by free boric acid was first noticed by Geoffroy, a celebrated chemist, in 1732. In 1748 Baron discovered that borax was a sedative salt and soda. In 1818 Count Larderel discovered how to prepare boric acid from the lagoons of Tuscany and made a princely fortune by it. This boric acid was shipped to England and France and converted into refined borax by boiling in large pans and crystallizing in vats. About fifty years ago borate of lime was discovered in Chile, which also found its way to England. As far as is known, borax is found only in three States of the U. S., California, Nevada and Oregon.

The borax deposits in California are adjacent to the portion of the Mojave Desert called Death Valley. The history of Death Valley is found only in tradition.

In the year 1850 the number of parties of emigrants bound for California from the Eastern States was so great that their trains of wagons formed almost a continuous procession from the Missouri River to Salt Lake City, some going on the route which was afterward followed by the Central Pacific Railroad, while the rest struck down through Utah, Nevada and Southern California, through the Cajon Pass, for the regions of which Los Angeles was then, and is now, the metropolis. On reaching Salt Lake they struck off to the south, because the northern, or Truckee River, route had been traveled so much that feed and fuel (the land being a desert) were scarcer than to the south. There was nothing unusual about

* Parts of a paper read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

the move, however, for a good many parties did the same thing, traveling along the trails leading near the west bank of the Colorado River for a few hundred miles, and then striking across the Desert, by way of several well-known springs, to the Mojave River, that sinks in the sands of the Mojave Desert.

Article after article of household furniture and everything not necessary for immediate use was cast aside to lighten the load and the women, as well as the men, walked beside the wagons rather than burden the worn-out cattle. Many of these pioneer prospectors lost their lives in the Mojave Desert, which is the reason it is called by the gruesome name "Death Valley."

The U. S. Weather Bureau on July 10, 1915, reported as follows:

"The mercury in Death Valley stood at 134 degrees in the shade. This is the hottest shade temperature ever recorded in the open air with standard instruments and according to improved methods of exposure in any part of the world."

This distinction as the hottest place on earth officially and unofficially corroborates the words of daring prospectors. Death Valley is one of the mysterious spots on the outside of this little planet.

In California, borax was first found in what was called "cotton ball" deposits. Depressions in the ground at some time had been filled with water containing borax in solution. When this water evaporated there were formed little balls of earthy impurities and borax. These so-called "cotton balls" were gathered and refined. Such deposits, however, were soon exhausted and scientists realizing the fact that the borax in the water came from the hills, prospected them and located well-defined veins of borate material.

As there were no railroads in Death Valley at the time of the discovery of borate material some method for transporting the ore to the railroad station had to be found. It was then that the now famous 20-Mule-Team was absolutely essential. The huge wagons drawn by these mules would hold a car load, and in the early days it took three weeks to make a round trip. Later, however, when nearer deposits were located, the trip could be made in a day.

The ore as found in California is colemanite, a crystalline borate of lime, found in volcanic deposits on the east side of the Calico Mountains at the edge of the Mojave Desert, California. The boric acid content of colemanite varies. The deposits are in two principal beds, each about 5 feet thick and 50 feet apart. These beds have been mined to a depth of 500 feet. After mining the colemanite is transported over land to Bayonne, N. J., where it is refined ready for market.

Borax is made by heating the pulverized colemanite with a solution of sodium carbonate, forming a soluble sodium borate which crystallizes. This solution is run into large tanks in which are suspended iron rods. As the solution cools the borax crystals form upon the rods. It is then run through a scalper. Large crystals are sold as such and small crystals are ground into powdered or granulated forms.

COMMENTS AND SUGGESTIONS ON THE USE OF GLYCERIN IN OFFICIAL PREPARATIONS.*

BY BERTHA MUELLER.¹

Within recent months considerable has been said and written on the conservation of alcohol, sugar and glycerin and, indeed, the subject is a timely one. While it is quite gratifying that the Government does not for the present consider it essential that the pharmacists of the country should be called upon to help in the conservation of these commodities, the time will no doubt come when we shall have to do our bit along these lines. Therefore, it will not be amiss to have worked ahead and tried out some formulas and suggestions given from time to time in the drug journals.

It is well known to every pharmacist that the use of these articles is very essential in the manufacture of pharmaceutical preparations, yet the amount required in a good many instances could be materially lessened. Especially is this true of glycerin where it is merely used as a sweetening agent, and there are a number of such instances among the official formulas.

Glycerin, then, being the chemical that can in many instances be more readily dispensed with than either alcohol or sugar, and at the same time the chemical the Government is in direct need of most, it occurred to the writer that a trying out of some of the official formulas with a view to reducing or, where permissible, omitting the glycerin entirely, might prove of interest. The following are a few preparations that have been tried out with that object in mind:

ELIXIR CALCIUM AND SODIUM GLYCEROPHOSPHATES N. F.

There appears to be really no good reason why the glycerophosphates should be mixed with so much aromatic elixir and glycerin as is the case in this elixir, for they do not taste badly and dissolve most readily and keep well in water having about one percent of lactic acid or a half percent of citric acid added to it. In our experience we found phosphoric acid unsatisfactory. Any aromatic water should serve to make a splendid vehicle for them. If, however, an elixir is preferred, the official formula modified as follows makes a very nice elixir, and one that keeps well:

| | |
|-------------------------------|---------|
| Sol. Sodium Glycerophosphate | 25.00 |
| Calcium Glycerophosphate..... | 8.75 |
| Lactic Acid..... | 10.00 |
| Aromatic Elixir..... | 500.00 |
| Distilled Water to make..... | 1000.00 |

GLYCERINATED ELIXIR OF GENTIAN N. F.

With an official Compound Tincture of Gentian and an Infusion of Gentian, both of which are splendid preparations in every way, there seems to be little excuse for an elixir of that drug. And it is particularly unfortunate that the glycerinated elixir should be so popular, for it is very costly on account of the high percent of glycerin in it, which does not seem to serve any real purpose.

* Read before the Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918

¹ Assistant Pharmacist,ankenau Hospital, Philadelphia, Pa.

Furthermore, the gentian content is so small that it can not possibly be of much value as a bitter tonic. However, if it is considered wise to have an elixir of gentian the nature of which approaches that of the widely advertised proprietary, a very elegant and rather pleasant tasting elixir can be prepared without the glycerin according to the following formula:

| | |
|------------------------------------|---------|
| Fluidextract of Gentian..... | 10.00 |
| Fluidextract of Taraxacum..... | 15.00 |
| Acetic Ether..... | 0.50 |
| Phosphoric Acid..... | 5.00 |
| Compound Tincture of Cardamom..... | 60.00 |
| Tincture of Sweet Orange Peel..... | 15.00 |
| Sugar..... | 400.00 |
| Sherry Wine to make..... | 1000.00 |

COMPOUND ELIXIR OF PEPSIN AND RENNIN N. F.

The following is a very satisfactory formula for this elixir:

| | |
|------------------------------------|---------|
| Pepsin..... | 22.50 |
| Rennin..... | 16.50 |
| Lactic Acid..... | 2.00 |
| Tincture of Sweet Orange Peel..... | 15.00 |
| Syrup..... | 150.00 |
| Alcohol..... | 200.00 |
| Oil of Myristica..... | 0.10 |
| Distilled Water to make..... | 1000.00 |

ELIXIR OF TERPIN HYDRATE N. F.

| | |
|------------------------------------|---------|
| Terpin Hydrate..... | 17.50 |
| Alcohol..... | 425.00 |
| Syrup..... | 400.00 |
| Glycerin..... | 100.00 |
| Tincture of Sweet Orange Peel..... | 20.00 |
| Distilled Water to make..... | 1000.00 |

NOTE: In connection with this preparation it is worth while recording that in one experiment diluted glucose was substituted for the syrup; although at first it made a clear preparation, after some days a dirty precipitate made its appearance. Right here I should like to say that solutions of glucose do not keep well; for that reason it will be good policy to be very cautious about substituting it for the official syrup.

GLYCERITE OF TANNIC ACID U. S. P.

The formula adopted by the B. P. Codex as a substitute for the official glycerite of tannic acid makes a very unsightly preparation. And it would seem that this preparation is not used in large enough quantities to justify the use of a substitute, as it is only used for local application and usually in small amounts. In this preparation glycerin serves a definite purpose; therefore, it can not well be replaced by a substitute without causing a depreciation of its activity; hence it would be better to leave this formula stand as it is.

GLYCERITE OF BISMUTH N. F.

Since the value of the bismuth salts lies in their insolubility, there seems to be no object in having bismuth preparations containing soluble salts of this chem-

ical; hence the glycerite of bismuth as well as the several official preparations into which it enters are unnecessary preparations and could well be dispensed with.

ALKALINE ANTISEPTIC SOLUTION N. F.

A permanent, very elegant, agreeable tasting Alkaline Antiseptic Solution can be prepared according to the official formula, with only one-third of the amount of glycerin called for in that formula. The solutions of Carmine and Cochineal N. F.¹ could both be dispensed with, as they serve no further purpose than to act as coloring agents. If a coloring agent is desired, the Compound Tincture of Persionis modified according to the following formula makes a very nice coloring agent for either acid or alkaline solutions:

| | | |
|----------------------------|-------------|---------|
| Powdered Cudbear..... | 100.00 | |
| Caramel..... | 100.00 | |
| Alcohol, one part | } q. s..... | 1000.00 |
| Distilled Water, two parts | | |

Moisten the cudbear with a part of the menstruum in which the caramel has previously been dissolved; allow to macerate for 48 hours, then extract by the usual methods of percolation. This makes a tincture that keeps well and gives a pretty red color to solutions.

SOLUTION OF FERRIC SALICYLATE N. F.

A very elegant looking solution of Ferric Salicylate, that keeps as well as one that contains glycerin, can be made according to the following formula:

| | |
|------------------------------------|---------|
| Citric Acid..... | 8.50 |
| Methyl Salicylate..... | 6.50 |
| Sodium Salicylate..... | 125.00 |
| Tincture of Ferric Citrochlor..... | 125.00 |
| Aromatic Elixir..... | 150.00 |
| Distilled Water to make..... | 1000.00 |

SOLUTION OF PANCREATIN N. F.

A very satisfactory solution of pancreatin can be prepared according to the official formula by substituting one decigram of saccharin for the glycerin in one thousand mils of the preparation.

AROMATIC SOLUTION OF PEPSIN N. F.

This solution of pepsin can be prepared and stands up well, according to the following formula:

| | |
|------------------------------|---------|
| Pepsin..... | 17.50 |
| Oil of Cinnamon..... | 0.25 |
| Oil of Cloves..... | 0.50 |
| Oil of Pimenta..... | 0.25 |
| Alcohol..... | 35.00 |
| Hydrochloric Acid..... | 10.00 |
| Glycerin..... | 100.00 |
| Talcum..... | 15.00 |
| Distilled Water to make..... | 1000.00 |

We can not help but feel that with an official elixir of pepsin and rennin compound, and an aromatic solution of pepsin, there is no real need for the glycerite

¹ Uniformity in color of preparations is important.—Editor.

of pepsin and the solution of pepsin into which it enters in conjunction with another lot of glycerin.

SYRUP OF CALCIUM LACTOPHOSPHATE U. S. P.

The following formula produces a preparation that is stable and looks well:

| | |
|-------------------------------------|---------|
| Precipitated Calcium Carbonate..... | 25.00 |
| Lactic Acid..... | 60.00 |
| Phosphoric Acid..... | 40.00 |
| Stronger Orange Flower Water..... | 50.00 |
| Sugar..... | 650.00 |
| Distilled Water to make..... | 1000.00 |

Glycerin is not necessary in Syrup of Hypophosphites and in Compound Syrup of Hypophosphites. The U. S. P. VIII formulas for these syrups yield just as nice and just as stable preparations as the formulas calling for glycerin. And the Compound Solution of Hypophosphites is nothing more than an unnecessary duplicate of the syrup and could well be dispensed with.

Aromatic Fluidextract of Cascara can be made according to the official formula without the glycerin. It stands up just as well as the preparation containing the glycerin, and is plenty sweet enough.

The compound tinctures of cardamom, gentian, and cinchona can all be prepared and stand up well without the use of glycerin in them. So far as taste is concerned, glycerin makes no material difference in any of them. In our experience the use of glycerin in compound tincture of cardamom as an agent to prevent the formation of gelatinous clots and sediment has not proven successful. Likewise it is uncalled for, since the preparation can be made without that annoyance occurring. As pointed out in a paper written by Mr. J. K. Thum some years ago, these undesirable features can be prevented by substituting spirit of cinnamon for the cinnamon bark.

The following is a very satisfactory formula for the making of the compound tincture of cardamom:

| | |
|------------------------------|--------|
| Cardamom..... | 25.00 |
| Caraway..... | 12.00 |
| Cochineal..... | 5.00 |
| Spirit of Cinnamon..... | 3.00 |
| Diluted Alcohol to make..... | 1000.0 |

It has been our experience that the sediment formed in the compound tinctures of gentian and cinchona is the result of faulty technic followed in their manufacture. In preparing a percolator for the extraction of the drugs from which these tinctures are made, it is well to pack the cotton tightly into the neck of the percolator, then the previously mixed and macerated drugs should be placed into the percolator without packing, then the menstruum added and percolation allowed to proceed according to U. S. P. directions (the U. S. P. menstruum minus glycerin being used). These tinctures prepared according to this method throw down very little inert matter on standing.

CHEMICAL THEORY, A PRACTICAL METHOD FOR TEACHING IT.*

BY FREEMAN P. STROUP.

One of the many problems that the teacher of chemistry has to solve is that of presenting the subject of chemical theory to his pupils in such a clear manner that all of them may get a fair grasp of it. The student who has an analytical mind, and whose preliminary training has been such as would develop it, has comparatively little trouble in understanding the explanations given in the ordinary text-books on chemistry, particularly when these are analyzed for him by an instructor; but to the student not blessed with an analytical mind, or whose early training has been faulty—the student who can not solve correctly the simplest mathematical problems—the correct writing of a chemical formula offers serious difficulties, while the correct balancing of chemical equations seems to him a veritable Chinese wall standing between him and the goal he is striving to reach.

All teachers who are at all interested in their work rejoice to see their bright pupils do good work, but the conscientious instructor gets more real enjoyment out of noting the gleams of dawning intelligence that occasionally light up the countenance of one of the dullards of his class as he begins to comprehend something which is being explained, possibly something which the majority of his classmates had grasped long before. In his efforts to reach these unfortunates the writer of this paper has tried various schemes, some of his own invention, some devised by others, and some his own adaptation of the ideas of others, and out of his experiences, extending over nearly a score of years, there has been evolved a system which he has used for several years and has found very helpful. Not only has its use enabled him to give his poorest students a fair understanding of chemical theory, but, he believes, even his brightest students have been given a stronger hold on the subject than they could have gotten otherwise with the same amount of study. To some of you this "card system" (so called for want of a better name) may seem too much on the order of the "kindergarten" to be given a place in a college professor's methods, but so long as it produces results that are worth while, he feels justified in using it, and in passing it along to his fellows in the fraternity.

EQUIPMENT.

The equipment is simple and need not be expensive, as it may be made from cheap and easily obtainable materials. If a wooden blackboard is available, one into which small nails may be driven, it will serve very well. In its absence one can be made from Compoboard or some similar light material, and enclosed in a frame made of floor lumber or similarly grooved board. It should be made so that both sides are available for use, one for Organic formulas and the other for Inorganic formulas and equations, and, of course, should be provided with hooks or supports so disposed that either side may be used at the pleasure of the operator. Inasmuch as the system is generally used to supplement blackboard instruction the board should be painted a dead black. There should be at least 30 by 60 inches of clear space inside of the frame. Horizontally across the faces of the board should be stretched wires, the chief function of which is that of supporting the

* Presented before Section on Education and Legislation, A. Ph. A., Chicago meeting,

cards used in demonstrations. Number 22 tinned steel or iron wire (about the size of ordinary broom wire) is quite suitable, as it can be easily stretched and, unlike copper wire or twine, remains taut. On the Inorganic side of the board the wires should be just three inches (the width of the cards) apart, and, because the space between two adjacent wires is intended to indicate a valence of one, a heavy white line should be drawn on the board under each wire. On the Organic side the wires are for support only, hence no lines should appear under them, and it is better to have them somewhat more than just three inches apart. At least eight wires are needed on each side, but more may be used to advantage on the Inorganic side.

PART I.

PART II.

EXHIBIT A.

Part I.—Board (30 by 30 inches) suitable for Formulas; should be 30 by 60 inches for equations.

Part II —Details for two-way card-hooks: 1, Blank, $1\frac{1}{4}$ by $3\frac{1}{8}$ inches; 2, blank with slit; 3 and 4, edge, showing bending stages; 5, 6 and 7, attaching to cards; 8, card with hooks attached but only one-half of hooks turned down

There will be needed a lot of dark-colored cards, each to contain the symbol of an element or the formula of a group. The writer made his set from cards intended originally for photograph mounts. A considerable saving may be effected by using both sides of each card, in which case, however, care should be taken to put on opposite sides such symbols or groups as are not apt to appear together in a chemical formula. If both sides are "positive" or both "negative" there will be no trouble. Six inches is a good length for the Inorganic cards and eight inches for the Organic. If only one side of cards is to be used, suitable supporting hooks may be obtained from a good stationer. If both sides are to be used, two sets of hooks may be used, or two-way hooks may be made easily from thin tin-plate (such as is used in making containers for certain well-known types of confections). A little study of the drawings (Exhibit A) should enable anyone possessing a pair of old shears, a small pair of pliers, a hammer, a little time and patience, to turn them out readily and in quantity.

The lettering on the cards may be done with crayon, but, preferably, with "white ink" put on with a camel's hair brush. If the "ink" is not obtainable from a stationer, one may be made from mucilage of acacia and zinc oxide, using water

for thinning. Zinc oxide seems to be the best pigment, as it is quite opaque, spreads well and remains white, even in an atmosphere containing hydrogen sulphide. A trace of phenol or oil of cloves will keep the "ink" from spoiling.

The Organic cards should be uniformly 3 inches wide, while the Inorganic cards should be 3, 6, or 9 inches wide, according as the symbol or group to be placed thereon has a valence of one, two or three. Cards for atoms or groups of higher valencies are not likely to be needed, as, once the students understand the use of the one-, two- and three-valency cards and the formulas developed with them, they will be able to work out mathematically formulas involving higher valencies. For demonstrating formulas only, a good working set of cards contains three each

EXHIBIT B.

of the commonly used organic groups and of the commonly used univalent and bivalent inorganic atoms and groups, and two each of the ordinary trivalent atoms and groups. For demonstrating equations readily, about four times as many cards of each kind will be needed. Ordinarily, however, it is not necessary to show more than a few type equations (see Exhibit C), in which case cards for only a few elements and groups are required in quantity.

For demonstrating organic "graphic" formulas it is convenient to have a card for CH₄, another for NH₃, each three spaces wide, and a third one for C₆H₆, seven spaces wide. The lettering on these should be, preferably, in a color distinct from that on the smaller cards. "White ink" tinted with a little lead chromate will do very well.

DEMONSTRATIONS.

Chemical Formulas.—A few typical formulas will be sufficient to demonstrate the use of this card system. In beginning the study of chemical theory with a new class of students the average teacher takes up binary compounds first, and later the more difficult ternary compounds, the majority of which fall under the heads, Acids, Bases and Salts. By means of this system the student can be brought easily to see that in the former an atom or atoms of one element are linked to an atom or atoms of another element, the number of each depending upon their several valencies, while in the latter there are groups of atoms, acting as units,

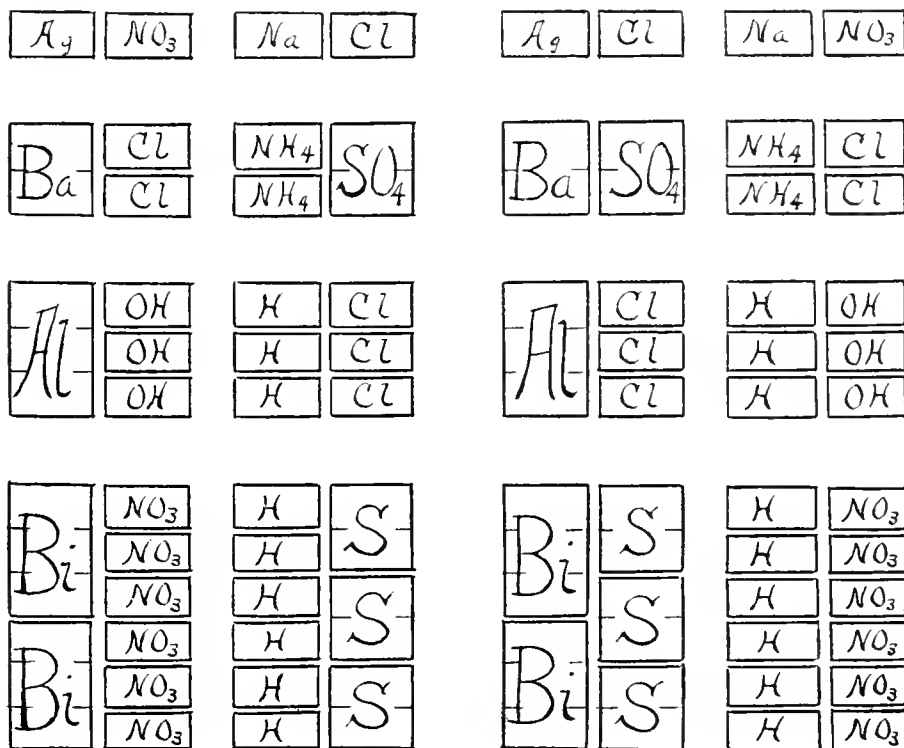

EXHIBIT C.

with definite valencies, and that the writing of formulas of ternary compounds should be no more difficult than the writing of formulas of binary compounds. He is taught that a formula is not correctly written unless the total valencies of the positive part (the left side) equals the total valencies of the negative part (the right side). In a card system formula the perpendicular width of the formula should be uniform throughout its length.

Referring to Exhibit B it will be noted that some of the formulas show combinations of two kinds of atoms, some combinations of an atom with a group, some combinations of groups with groups. Students are not apt to go far wrong with formulas of the type of KCl , $AgNO_3$, $NH_4H_2PO_2$ and $CaSO_4$, as only two cards are needed in each case. Now let the teacher put together one Mg and one Br , or one K and

one S, and the dullest pupil will see at once that something is out of balance, and will be apt to see that for one Mg two Br, and for one S two K will be required to give a balanced formula. It will then be quite easy for him to understand AuCl_3 , BiONO_3 , and $\text{NaNH}_4\text{HPO}_4$. The last three formulas in the set give the instructor a nice opportunity to develop a formula in stages. Taking As_2S_3 for illustration, one As and one S do not balance, one As and two S overbalance as to S, two As and two S overbalance as to As, while two As and three S just balance. By the time a half dozen such formulas, using different combinations each time, are worked out before him, it is a dense student, indeed, who does not begin to see things in their true perspective, and begin to wonder why he did not grasp them before.

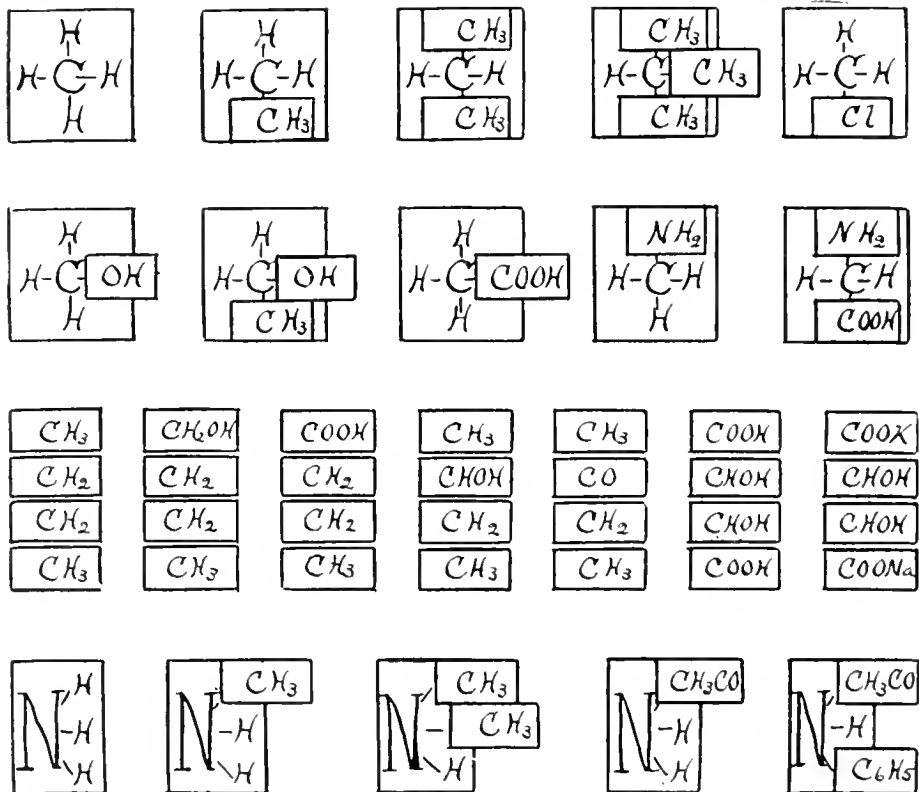

EXHIBIT D.

Of course, after a formula has been built up with the cards, it should be translated into the form in which it would appear in chemical literature, and the proper chemical name should also be taught at this time. It seems best not to attempt any but inorganic formulas at first, but, later, after organic compounds have been taken up for systematic study, formulas of Acetates, Tartrates, Citrates, Benzoates, Salicylates, etc., both of inorganic and organic bases may be shown.

Organic Formulas.—The two main classes of organic compounds are the saturated open-chain and the closed-chain (or cyclic) hydrocarbons and their derivatives, mostly substitution compounds. The former have as their nucleus Methane (CH_4), the latter Benzene (C_6H_6). Certain nitrogenous compounds can

best be considered as derivatives of Ammonia or Amine (NH_3). Exhibit D illustrates just a few of the possibilities of the card system as a means of building up complex formulas from simple ones, and for showing the structural relationships that exist between seemingly unrelated substances.

The card system is particularly well adapted to the explaining of isomerism among organic compounds, its effectiveness being best shown, perhaps, with the aromatic compounds, those based on C_6H_6 (Exhibit E). It is easier to shift a card from one position to another than to make the necessary changes in a written formula, and, besides, the writer has noticed that many students "catch on" quicker when they see a card shifted from one place to another than when they see

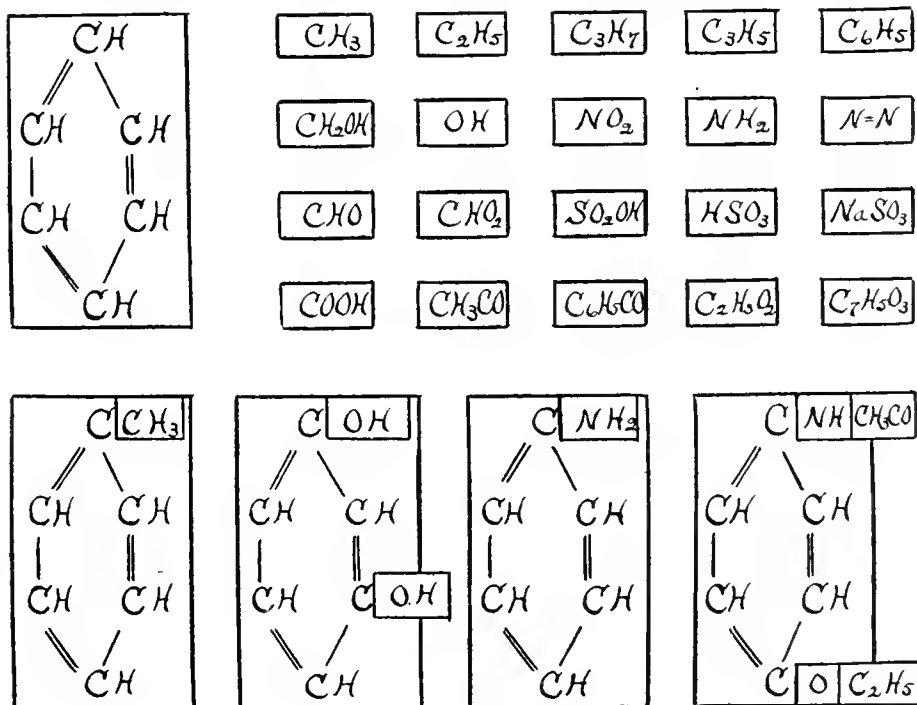

EXHIBIT E.

one lot of chalk rubbed off the board, another put on in the restoring of a letter or group, and still another change made at some other place in the formula. In teaching class reactions it is instructive to take up the syntheses of several more or less complex but well-known substances, beginning with the underlying hydrocarbon. One of the best for illustrative purposes is that of Phenacetin, and this may be worked out beautifully with the card system, and generally makes a lasting impression on the minds of most students. Exhibit F suggests how it works out, if the cards are used in the order indicated by the numbers.

Chemical Equations.—Exhibit C gives only a few typical equations of the many that may be developed by the card system. It works perfectly for equations involving simple interchange of atoms or groups, without change of valence, but it is not well adapted to the showing of oxidation and reduction equations, where

there is change of valence; but, inasmuch as most of the equations which the beginner meets in his studies are of the interchange type, it is worth while to use it. Of course, card system equations should be promptly translated into the ordinary text-book form, for that, after all, is the end sought, the system being only a means readily to attain that end. After the student has once learned to balance equations of this type he can be more or less easily trained in the balancing of oxidation and reduction equations. It should be observed that, by considering each card as standing for an ion, the ionization theory may be effectively demonstrated. Cards making up formulas of highly ionized compounds may be left some distance apart, while those composing the formulas of un-ionized compounds may be butted closely together.

EXHIBIT F.

Some of the writer's pupils have made for home use sets of miniature cards from thick paper or thin cardboard, considerably to their advantage. The mere making of the cards, even though never used, is instructive, as the maker becomes thus impressed with the symbols of elements, the formulas of important groups, and, what is of vast importance to him, the valencies of these.

Enough has been said to give you a fair conception of the possibilities in this system. Actual use of it will bring to light possibilities not suggested in this paper. With the hope that others may have even a greater degree of success with it than the writer has had, he gladly passes it on to his fellow-workers in the teaching fraternity. Should any of them think it worth trying he would be pleased to hear what success they have had with it, and he would be glad to receive suggestions as to how it may be improved.

ENTRANCE REQUIREMENTS TO PHARMACY.*

BY WILLIS G. GREGORY.

Recognizing both the serious shortage in drug clerks and the desirability of attracting to pharmacy the most desirable recruits, the New York State Board of Pharmacy has tried to meet both conditions.

Of course, the temptation is ever present in any emergency to surrender some of the safeguards that have been laboriously constructed through years of endeavor. But unless absolutely necessary, no backward step should be taken.

The problem then was how can present needs be satisfied without the sacrifice of much future good. The Colleges of Pharmacy in our state all reported that high school graduates sometimes declined to study pharmacy because of the

* Read before Section on Education and Legislation, A. Ph. A., Chicago meeting, 1918.

long interval between their graduation and the time they could take the Board Examination, caused by the four-year experience requirement.

To save these high school graduates to pharmacy, as well as to increase the number of young people entering its ranks, it was proposed to credit to such students two years of the required practical experience for their high school course.

Here are some of the considerations that led to this proposal:

A. How many of us honestly think a high school graduate should spend two or three years running errands, washing bottles and tending soda fountain? The conditions of apprenticeship are not the same in any calling as they were in the youth time of many of us.

B. Some of us have had experience with high school graduates beginning behind the counter; not always satisfactory, of course, but in many cases the experience was sufficient to prove that a short period of training gave us comparatively safe and efficient helpers.

Credit for education is not at all a rare thing.

A. In Europe, where three years' compulsory military service has been the rule the college graduates have been credited with two years and obliged to serve only one.

B. In America, where pharmacists are obliged to enlist as privates, medical graduates are at once given a lieutenant's commission.

C. In our new army, where pharmacists have enlisted as privates, many of them have been transferred to the medical corps, where they not only are of more service to the nation, but where also they are relieved of much military drudgery.

D. In this state, three years of study in a practicing lawyer's office, is required for admission to the bar examination, but in the case of a Law College graduate, this period is reduced to one year.

Instances of this character could doubtless be multiplied. The world over, education is recognized as increasing a man's power and value and as enabling him to accomplish any intellectual training in less time than can be done by one less thoroughly trained. Why should not this principle be recognized and applied in pharmacy?

This proposition, which the writer still thinks possesses considerable merit, did not receive unanimous approval, and so it was not pressed. However, there sprang from it another plan, which did not excite opposition and which may be helpful in the present crisis.

Graduates of registered Colleges of Pharmacy with two years of practical experience, including the time spent at college, and 19 years of age, are permitted to take the pharmacists' examination, except practical pharmacy, at once, instead of waiting for 21 years of age and 4 years of practical experience. For such examination, if successfully passed, a new license will be issued, to be known as a "Junior Pharmacist" license. This license will confer upon its possessor similar rights to those now given a licensed druggist. In addition, upon the completion of four years' experience, 21 years of age, and passing the practical pharmacy examination, the "Junior" license can be exchanged without other requirements for a pharmacist license.

The object of this plan is to permit students who go from the high school into the College of Pharmacy, without having secured much previous drug store experience, to take the State Board Examination soon after their college training, while the theoretical and technical part of their education is still fresh in mind.

It is believed that this new arrangement will increase the number studying pharmacy and that these additions will be of good quality. That this innovation in entrance requirements may not prove too shocking to ultra-conserva-

tives, the writer has saved for this last sentence, the statement that this change has been enacted already into the law of the State of New York and the first examination under it has been held.

SO-CALLED COMMERCIAL PHARMACY SHOULD NOT BE TAUGHT AT COLLEGES OF PHARMACY.*

BY FREDERICK J. WULLING.

From a list of suggested titles for papers I will speak indirectly and collectively on the following:

1. Teaching of Commercial Pharmacy—Suggested Methods and Materials.
2. Psychology as Applied to Business Should Be Taught in Our Colleges of Pharmacy.
3. The Qualifications of a Teacher of Commercial Pharmacy.
4. What Percent of Our Curriculum Should Be Devoted to Commercial Subjects?

From these titles it would appear that it is taken for granted that commercial pharmacy, whatever that is, should be taught by the colleges of pharmacy. I dissent from this view unless by the term "Commercial Pharmacy" is meant the commerce incidental to the practice of pure pharmacy. In that case the phrase would be entirely misleading. It is clear that the term has quite another meaning and that by it is meant the commerce in all the multifarious commodities and products other than drugs and medicines carried by the so-called modern drug store. Much of that kind of commerce is not related to pharmacy in any wise, except that it is carried on vicariously by pharmacists. If the same kind of commerce were carried on, as it is in a large measure, in other places of business it would certainly not be called commercial pharmacy. In fact there is no commercial pharmacy at all. The term is an incompatibility. Pharmacy is a department of medicine and not trade. We have the contradiction of persons called pharmacists, specially privileged and empowered by the state to render an important professional service to the people, engaging in trade and calling it commercial pharmacy. There can not be any objection to the trade itself carried on by the pharmacist; the objection is to the fact that it is allowed to overbalance in many cases the activities of pharmacists who are especially licensed to do something else. It is unquestionable that the legislatures when they enacted the pharmacy laws and established the boards of pharmacy intended to have them apply solely to the practice of pharmacy and not to trade. In enacting pharmacy laws the legislatures intended thereby to provide trained and educated persons to render competent pharmaceutical service to the people. Such training is not necessary for carrying on trade nor for the protection of the public in such trading. *In return for the highly specialized service intended and expected by the legislatures they gave to pharmacists all the benefits and advantages of a privileged class by restricting the practice of pharmacy to them and excluding all other persons from engaging in the practice.* It is true that the law does not specifically prohibit licensed pharmacists from engaging in trade while exercising and enjoying the special privileges

* Read before Section on Education and Legislation, A. Ph. A., Chicago meeting, 1918.

bestowed by the state, but as I see it the voluminous trade activities, especially of the larger so-called commercial drug stores and departments, exhibit on part of the proprietors a disregard of ethics and a lack of the sense of obligation and of good faith owing to the state for the privileges granted. Is this increasing commercial practice, especially on the larger scale, not an exploitation of an honored and highly responsible calling? It seems so to me and I believe the coming generation and the many high-minded of the present generation will not tolerate an unabated continuance of it. There are many things pointing that way. Some legislators have already expressed themselves as favoring a limitation by law of the number of pharmacies and of restricting the activities of registered pharmacists to the practice of their calling. Personally, I am in doubt of the wisdom of such measures in this country, but we may come to them.

There is also indisputable evidence that many persons, even entire families, are seeking and enjoying in increasing numbers the pharmaceutical service of those who are devoting themselves exclusively to the rendering of that kind of service. Professional pharmacies are increasing in number and, although the increase is slow, it is gaining momentum. Concurrently, some of the larger department drug stores, probably for economic reasons, are relinquishing entirely their dispensing and pharmaceutical departments. I am told that there are now five such drugless drug stores here in this city of Chicago. A new name will have to be coined to designate these establishments.

Can we consistently blame the Government for failing to recognize pharmacy as it is generally practiced to-day as a profession and as worthy to be included in those higher and specialized agencies upon which it called to help prosecute this war? While I feel that the Government ought to recognize and avail itself of that membership of the calling capable of purely professional practice, there is some force in its implication that the excessive and dominant commercial practices establish a general standard not fit to be recognized as commensurate with those of other more highly standardized callings. As I have often maintained, commercialism is just as necessary and respectable as professionalism, but is it not wrong for the practitioners of any department of commerce to usurp the privileges and to lower and sophisticate the standards of a profession?

The claim sometimes made that the commercial activities of pharmacists are a necessary economic development is not well taken if viewed from the standpoint of the legislatures which created the laws regulative of pharmaceutical practice, except possibly in the cases of small towns who could not support a purely pharmaceutical establishment and whose inhabitants would otherwise be deprived of necessary pharmaceutical service.

I now ask: Is it consistent for the colleges of pharmacy, the most important and fruitful agencies for the maintenance and uplift of professional pharmaceutical standards and ideals; the chief evidences of the recognition, on part of the better qualified and of those possessing discernment and good judgment, of the professional nature of pharmaceutical practice; the very factors which by their teaching and example have more than any other endeavored to stem the tide of commercialism and which have had their origin in the perception of the necessity of a thorough scientific and ethical training of practitioners, now to lower their standards and repudiate the very basis and ideals upon which they were founded? I say a

thousand times No! Colleges are to set standards and to lead, not follow. They are to be true and faithful to the purposes for which they were established; to train men and women to become scientific, safe and thoroughly efficient pharmacists. There are other and better schools and colleges for commercial training.

It is proper for colleges of pharmacy to give limited instruction on subjects that would make students more intelligent in the conduct of the business connected with the practice of pure pharmacy. A few lectures by specialists on each of the subjects of pharmacy laws, contracts, agency, commercial paper, property, insurance, bailments, partnership, transportation and the like and an introduction to general psychology would greatly help the student in all business matters connected with his professional practice.

It is significant that not many colleges of pharmacy teach "commercial pharmacy."

A SQUARE PEG IN A ROUND HOLE.*

BY CHARLES W. HOLZHAUER.

This is a day of specialization. No matter what may be the nature of the career a man may choose for himself—professional, commercial, military, literary, artistic—he has his calling what it may, his first aim and desire is to train himself so efficiently that he fits his job, and his job fits him. When he has achieved this "perfect fit," then, indeed, is his future success assured.

If you expect to make a man a good foot-ball player, you coach him in every intricacy of the game, teach him all the styles of play, prepare him physically at the training table, harden his muscles by systematic exercise—in short, the good coach tries to develop a finished product, capable of meeting any situation which may arise in the course of the game.

Pharmacy is not foot-ball, true enough, but some of the methods of foot-ball may be copied with profit to pharmacy, and it seems to me we should try in just this way to perfect our students of pharmacy for the actualities of the profession ahead of them. Our pharmacy courses are not comprehensive enough when we consider the future demands upon the student. Many of our graduates are "square pegs" and the work they are called upon to do proves to be the "round hole," *and they don't fit.*

But why this misfit? At the outset it might be well, perhaps, to define our ideas of what we expect our colleges to do. My own idea is this: the first consideration in shaping the course of instruction should be to make of the student a good prescriptionist—a capable and safe man to handle drugs. Naturally this is paramount. The second consideration should be to make of the student the most valuable and useful man behind the counter. Of course my view-point is that of the drug store, but is not that the very best view-point from which to consider the product of our schools? I have no figures available, but I think it is safe to say that at least 80 percent of our graduates spend their careers within the confines of the drug store, and if this is true, certainly the proprietor of a drug store ought to be as good a judge as any as to whether the young graduate measures up to his task or not.

* Read before Section on Commercial Interests, A. Ph. A., Chicago meeting, 1918.

Of what will the work consist which our graduate is called upon to do? Will he be asked, the very first morning he arrives at the store, to assay a sample of *nux vomica*? It is not likely. Will he be requested to keep his eye in the microscope, differentiating between pure drug and adulterant? I don't think so. Will the store want a chemical analysis of a solution? Hardly that. Of what, then, will his work consist? If it is an average store—and that is the one I am considering—he will be called upon to compound a few prescriptions (and we remember that about one-third of this work consists in transferring tablets and liquid from one container to another), possibly prepare a few simple preparations, and the remainder of his time will be devoted to checking up stock, pricing it, putting it upon the shelves, selling goods, thinking up and making window and counter displays, selling stamps and licorice root to the children, and at the same time serving as general information bureau for the neighborhood. Bear in mind, please, that I am talking about the *average* store. There are a few, and a *very* few stores, where these conditions do not obtain, but for the vast majority they do, and I don't think I have misstated the facts. A few stores in the large cities maintain prescription departments where men do nothing but prescription work, and some few have laboratories where preparations are made, but they are the exception rather than the rule, and I may say in passing, that there are not enough of these exceptions to accommodate all our graduates. A store was opened on Broadway, New York City, a little over a year ago. Its first window display was a United States Pharmacopoeia artistically set upon a bit of velvet in one window, and a mortar and pestle in the other. The interior was immaculate. The usual display cases were missing, the clerks wore snowy white uniforms, and fine furniture and easy chairs awaited the customer as he entered. Nothing could have been more ethical. But the store has ceased to exist and the man who bought the place is wondering whether he did not pay too high a price for what was left.

These are the conditions we are facing today, have faced in the years just passed, and, as far as I can see, will face in the future. Whether we like them or not I am not arguing. No doubt they ought to be changed, but the fact remains that they are here, and we have to make the best of them. A man can not make a living in these times, let alone provide for his future needs, by confining his business solely to the sale of drugs and prescriptions and sick room supplies. It has been tried and found wanting. His knowledge as to whether quinine turns red or blue when a drop of nitric acid is added will not help a bit when the landlord says the rent is due. The knowledge that phenacetin is the monoacetyl derivative of para-amidophenetol isn't good and valid consideration for your payment at the bank of your loan. The druggist must sell other merchandise, goods the people want, if his store is to succeed and he is to become a power in the community.

To return to our young graduate and his work, we find, then, that his activities will be divided, let us say: 50 percent pharmaceutical and 50 percent commercial. I am sure it is quite safe to say that of every \$100.00 received in sales in the average store, at least \$50.00 of it comes from purely commercial transactions. I have carefully noted our sales at various times and I must admit that our side-lines play an important part in the total. If the pharmacist has ability as a business man, does that detract one iota from his other attainments?

Doesn't it add to them and doesn't he command all the more respect from his associates? I see no reason why a man can not be a good business man and a good pharmacist. In many of the lines we carry, and must carry, we are in direct competition with other merchants, and we must be just as alert and progressive as they are if we are to handle the lines profitably.

Conditions in the drug world have changed very materially in the past fifty years, and unless we wish to progress backwards, we have to change with the times. I have often heard my father say that sales on a Saturday night forty years ago consisted very largely of salts, senna and hair oil. These articles are not our main items to-day. He *made* compound cathartic pills by the barrel. We *buy* them to-day, and are money in pocket by so doing.

Since times have changed, we must concede the importance of the commercial side of our calling and give our students training in this branch to better fit them for their life-work. Let us take a glance at our Syllabus and see whether, in the matter of instruction, it approximates conditions as they exist. I find that out of a total of 1200 hours in the course, 75 hours, or 6 $\frac{1}{4}$ percent, are devoted to commercial pharmacy. The conditions as we find them in the store are 50-50, in the Syllabus 6.25-03.75. Is this as it should be? I think not. My plea is for increased instruction in commercial pharmacy. Our schools have added some instruction in this line, but it is not enough. The amount should be increased and the scope broadened. And isn't this right in line with other institutions of learning? Our universities have added such courses because they recognize the fact that their students need them, and the college is the place, best equipped, to give its men this training. Our large universities have even changed their entrance requirements to meet changed conditions. Why should not we change our pharmacy courses?

It is said that the pharmacy school is not the place for commercial training; that a man must acquire it through experience. It is true he will gain much by actual experience, but how many stores can give sufficient time or have facilities or *inclination* to give the young graduate the proper training? The school can do it and do it far more efficiently, but even though the student does gain business knowledge through the store, he will gain it at a far greater cost in time and money, and with greater difficulty than he would have gained it through the instruction of experienced teachers in college.

One very great result, it seems to me, would ensue if our students were given further training along commercial lines, namely this: it would actually increase the professional side of our business. What stores to day do the largest prescription business? The *Bulletin of Pharmacy* tells us that the store doing the greatest volume of prescription business is also the one that sells the most tooth brushes, photo supplies, shaving accessories, soda water, etc. And it is true. About a year ago we moved into a new store. Our space was very considerably increased, also our facilities for handling a larger volume of business. We sought to increase our prescription department and various methods were suggested. Among others, it was suggested that we send prescription blanks to all the city physicians. I consulted several friends as to the advisability of this suggestion and received answers at great variance. One man said it was simply throwing money away. Determined to find out by actual test, we sent blanks with our card at the bot-

tom to all practitioners in town and awaited results. We sent pads of one hundred blanks each to every doctor. It didn't take long to find out that it was a paying investment, for in a little over six months we had our money back, and at this date (somewhat over a year) we have received a very satisfactory dividend. In compiling our returns we eliminated all prescriptions which we thought we would have received in the natural course of events. Our aim was to arrive at strictly new business. I merely mention this incident to show how commercial training may be turned to good advantage to develop the drug and prescription departments. Wouldn't an applicant for employment in the store be worth considerably more if he could write a series of letters and conduct a campaign of advertising to the doctor featuring drug and prescription service? If he could say: "This is the way we should catalogue and arrange our stock," and: "This is the easiest and best way to take our inventory," and if he could dispose of that gross of liniment that has been in the cellar over a year through an attractive window display. He would be worth more to his employer and command a good and ever-increasing salary, and in his own store earn a far greater profit.

But, it is also said, there are men who expect to be truly pharmaceutical chemists—men whose work will be in the laboratories of manufacturing houses—men who expect to be teachers of pharmacy—what about them? Even though their number may be small, we should give them the instruction they should have. The answer is easy. Our schools are amply manned in both men and equipment—barring war conditions—and the courses are open to men who expect to be really scientists. I note that some of our schools favor four years of high school work and then four years of pharmaceutical training. Of course such education would justify a B.S. degree, and anyone who wants it can obtain this degree in this way now, and I know of one school, at least, that will give a very full and complete pharmaceutical education in the four-year course. My thoughts on this subject refer to the Ph.G. course—the one that the man behind the counter usually takes. For the future pharmaceutical chemist this instruction is not nearly sufficient, and he should matriculate in one of the advanced courses. We need not worry about him.

In conclusion, it is fitting to ask how such a change in courses of instruction can be made. The course is overcrowded now and will bear no further extension. I answer frankly—I don't know. Whether it should be done by deleting some courses we now have, or by retaining our present course and adding more commercial training to it, I do not attempt to answer. I believe we are giving some instruction which has very little value to the student in his future work, but I do not know whether it should be discontinued. Nor do I wish to give the impression that scientific training should be sacrificed for the sake of commercial. It is of greatest value, and the world would be in a sorry plight if we had no further scientific education and advancement. Our present pharmacy course gives a man a splendid education and much useful knowledge whether he remains in the drug business or not, but I do insist that along with it he should be given a thorough business training of such quantity and quality as is commensurate with its importance in the drug store of to-day. If conditions change later, change the course, but graduate the students of to-day well grounded in both branches of our calling.

The man whose business is at a standstill, who never makes more than enough to get along, be his profession ever so scientific, loses respect for his calling as well as the respect of his neighbors. We all know how "Nothing succeeds like success." Let this same man turn his business into a paying proposition, become a "live wire" in the community, and watch his self-respect go up by leaps and bounds. He is still a "man of science," but he is also a man of standing. He unconsciously boosts his profession wherever he is seen or mentioned. Since we can not change the nature of the pharmacist's job to suit his training, why not change the nature of the training to fit the job?

Students well informed in both branches of our calling will have a far greater chance for success, will be far more valuable in the store, will be looked up to by their fellowmen, and will be a credit to pharmacy. Give us more commercial training, and instead of a square peg, give us a round one to fit a round hole.

ABSTRACT OF DISCUSSIONS.

Jacob Diner, in opening the discussion on Mr. Holzhauer's paper, cited some of the methods employed by the "ethical drug store" of his paper. In literature sent out from this store 95 percent of the druggists were charged with being substitutors. In another letter, directed to physicians, the charge was made that the physicians addressed evidently did not care what became of their prescriptions. Continuing, the speaker said:

"I do not wish to deprecate the need of commercial training in pharmacy, which is, perhaps, more largely commercial than any other profession or semi-professional calling, but I do believe that the primary function of the college of pharmacy—I emphasize the words 'primary function'—is to prepare a man to do that work which as a pharmacist he is called upon to do. It is desirable that that man should have some knowledge of commerce, some knowledge of merchandising and stock taking and invoicing, sending out letters, advertising, and all that sort of thing. A poor letter may destroy good business, but shall we make that the principal end of the training of a pharmacist? I do believe that a successful business man is practically born, and not made. The man who is not born a business man can acquire a certain amount of training. The department stores, which are purely and fundamentally commercial, have established in their own institutions training classes for their salesmen and salesladies. I believe that a solution of the problem would be a postgraduate course in commercial pharmacy rather than an undergraduate course in commercial pharmacy.

There is, no doubt, a great deal of truth in what Mr. Holzhauer has said, that at least fifty percent of our business is commercial, but I am sure that he will admit that it would be a mistake to take fifty percent of the curriculum for commercial pharmacy. I do not believe that boys and girls, when they come to the pharmacy school, are in a position to grasp the principles of commercial pharmacy as readily as the principles of theoretical pharmacy. I believe that the commercial end can be learned more readily by experience after passing examinations and when they can devote their entire attention to the subject of commerce. Such training can be obtained in a store. Let us have well trained commercial pharmacists, but not at the expense of the professional education and training, of which there is so little in the ordinary drug store.

CHARLES W. HOLZHAUER. I do not undervalue professional pharmacy; I say that the first consideration should be to make a good prescriptionist, a capable man to handle drugs. I did say, and I do say, that if we give our men more commercial training they will be more valuable and useful in a drug store and they will make a greater success of their business and of their lives than under the present conditions.

HARRY B. MASON. The educators have said, and probably always will say that we ought not to teach commercial pharmacy; that if we teach commercial pharmacy or recognize its existence at all, we magnify the evil. Now, is not that a fundamental fallacy? Of course, we have the high ideals that our men are to be trained scientific pharmacists. The schools have always laid emphasis on scientific work, but it does not make so much difference what you teach, conditions in actual life will differ from the economic conditions. You can not stem the course

of a river by saying so. Let us have done with that if we hold up high ideals we will change the source and course of the stream. We are facing a condition and not a theory; we have the retail drug business as it exists to-day. Mr. Holzhauer says it is fifty percent commercial and fifty percent scientific. I would be inclined to say it is seventy and thirty. We have heard a good deal in the last twenty years about vocational training. We have it in all other vocations, but they are not training the young men to-day, and never have trained them, to go out and practice the drug business, with the condition of the drug business as it is actually conducted. For the last ten or fifteen years I have paid a good deal of attention to the subject of business accounting, and I have conducted a large correspondence with druggists all over the country, and I know that the average druggist and his clerk are untrained in business. Mr. Diner says that the business men are born and not made. If a man is a born business man he ought to know after nineteen years how to assimilate what he is born with. You might as well say that a lawyer is born, so do not trouble him with a law course. You have to train a man for any occupation, whatever it may be. I agree with Mr. Holzhauer that the statement is fallacious, that if you send out a man with a commercial training you will lessen his interest in professional matters. I know it is a fact that most of the commercial stores, large stores, are the ones that develop their prescription business. Not all of them, but most of the larger stores which are commercially successful, develop their prescription business and have four or five or six or eight prescriptionists who do nothing else but dispense prescriptions.

Now, let us do away with the idea that if we train a man commercially we will lessen his interest in the professional aspects of his business. It seems to me that it all harks back to the fact that we are facing a condition in the retail drug business through evolution, and we must recognize it and prepare the young men for it. I echo Mr. Holzhauer's sentiments that an educational institution, if it is worth its salt, must keep pace with changing conditions and should not educate a man to practice his calling as it existed forty years ago, but to practice his calling as it exists to-day.

LEONARD A. SELTZER: Mr. Mason is the high-priest of business in pharmacy; as the editor of one of the leading journals he has done a very great deal in educating pharmacists throughout this country in business methods. But it seems to me that the things he has told us just now, while true in themselves, are misleading, because while business in pharmacy is absolutely necessary, the question we are discussing is where shall that education be obtained. Now, is business training any less necessary in a grocery store or dry goods store than a drug store? I venture to say not. And yet we have no schools for dry goods or grocery stores or meat markets. There is only one place where we can learn the business and that place is not in a school. I have had, under my training, men who have gone to business college, and it has been necessary for me to show them the principles of business. I did not get my business training in a school and in less than six months I took charge of a set of books.

There is only one place where we must gain our technical knowledge, and the only one chance we have to get it is in our pharmaceutical schools. Let us devote our time in the pharmaceutical schools to learn these things and we will gain our commercial training in actual business, if we ever get it at all.

JACOB DINER: Mr. Mason misunderstood my statement or misinterpreted it. I said a good business man is born, but I also said that a certain amount of business training could be acquired. I agree with Mr. Holzhauer that the best postgraduate course is behind the counter, but if the young man needs some theoretical or practical knowledge on commercial subjects, by all means give it to him. Provide for it in the postgraduate course. But let us not take away the fundamentals.

CHARLES W. HOLZHAUER: The theory that a man shall get his experience in business life, of course, is fine. The only trouble is, it does not work. How many stores have the facilities, or how many men running drug stores are competent to give their clerks that training?

BUSINESS TRAINING IN COLLEGES OF PHARMACY.*

BY E. FULLERTON COOK.

The teaching of business principles to students in pharmacy hardly needs a defendant at this time, but the scope of training, the details of instruction, and the methods for teaching, deserve the fullest discussion.

For many years, educators in pharmacy, and in fact, the majority of those conducting retail drug stores, were afraid to breathe the word "commercial." The ethical standard believed essential for professional ranking for pharmacists, seemed to require the elimination of the word "business." It is true that a few retail druggists, who possessed either unusual business acumen or were fortunate in securing training in the essentials of business, have conducted model stores from every standpoint, receiving the admiration and respect of all, even the most ethical of physicians, and with it an adequate financial return, yet many splendid druggists, with the highest ethical ideals, but using poor business methods, have gradually succumbed to inevitable business failure.

It was due to the years of observation of these conditions which finally led Professor Remington to advocate business training as an essential and compulsory part of a pharmacist's training, and he often said that if the majority of those who failed, had been taught common business principles, he believed they could have retained their ethical standards and also conducted a profitable business.

To admit the desirability of commercial teaching as a part of a professional education, opens the doors, it is true, to many extremes, and it is this phase of the subject which needs careful consideration and wise action.

So-called "pharmacy" to-day, in some of its developments, is so completely commercialized that the word "pharmacy" is no longer deserved.

In this type of drug store, the part of the day's activities which suggests professional pharmacy assumes the position of a small side-line and the man in charge of the "prescription department" has little or nothing to do with the business management. This is reserved for the business head, who more than likely is not a trained pharmacist and who has usually obtained his training in purely commercial circles.

Apparently having this class of pharmacies in mind, there have been a few earnest advocates of a commercial course for pharmacists which would replace two-thirds or more of the present college curriculum by purely business training, making a special feature of advertising and selling methods. This group represents one extreme, and on the other side stand those who can find no place for even the most elementary of business principles, in the course of a pharmacy school.

It is the midway course that seems advantageously to find a specific place in many of our colleges and which has proven itself of great value to graduates. Repeated testimony to that effect has been heard and the interest taken by the students and their progress in the work, further evidence its desirability.

It is not necessary here to outline the details of such a course. The "Syllabus" does so admirably and a number of papers are on record covering the individual ideas of those who are teaching the subject, but once more a brief statement of the course, which it would seem wise to follow: *i. e.*, instruction in the

* Read before Section of Commercial Interests, A. Ph. A., Chicago meeting, 1918.

ethical principles involved in business, then in the essentials of business success, followed by an outline of business terms, customs, and methods and, afterward, enough practical use of the machinery of business to give the necessary familiarity and confidence in banking procedure, common law, legal documents, insurance, general financing, accurate, but simple accounting, etc.

Such a training is proper for any professional man and will become an important factor in the success of his professional career. The giving of courses of a more essential commercial character, such as advertising and salesmanship, are open to differences of opinion, but the foregoing should properly find a place in a school of pharmacy course.

HISTORICAL OR EARLY PHARMACY IN INDIANAPOLIS.*

BY FRANK H. CARTER.

Pharmacy and the drug business of Indianapolis have changed just as in all other cities, towns and communities, and the people have changed with them.

Craighead & Browning, afterward Browning & Sloan, and still later Browning & Son, conducted and owned "The Apothecary Hall" on Washington Street. They were, no doubt, known to more people in Marion County and, to an extent, throughout Indiana, in their day than any other firm I can mention. George W. Sloan, after leaving the firm of Browning & Sloan, was prominent as a local druggist, as adviser and helper of young men. He was active in all movements for the betterment of schools and civic conditions and nationally favorably known in pharmaceutical affairs.

John C. Green, at the corner of Delaware and Washington Streets, was succeeded by W. A. & I. N. Pattison. A. Metzner conducted a store in the small, old frame building at the corner of Virginia Avenue and Washington Street, and was succeeded by Stilz & Hoffman, now in the new Indiana Trust Building. C. C. Dennis, on Pennsylvania Street, near Market, succeeded Swing & Dennis, and James R. Perry followed Perry Brothers.

J. W. Bryan was located near the old Union Station and F. A. Bryan on Massachusetts Avenue and Vermont, in the quaint one and a half story frame building. J. W. Dryer, a brother-in-law of the Bryans, had a store at Noble and Washington Streets.

H. H. Bates had a store in the old Bates House, on Illinois Street, on the same ground occupied by the present building. He was succeeded by Gray & Beyschlag, who conducted for many years one of the best known stores of the town. Cobb & Hay were located at the N. E. Corner of Illinois and Washington Streets, in the store which is still standing and its looks indicate that it was one of the first buildings erected on this thoroughfare. They did a prosperous business, not only in drugs, but also in carbonated water of the kind sold in these earlier years.

Binford Brothers conducted a store on the Washington Street side of the Bates House in the '60's. On the night of the Andrew Johnson misunderstanding this store was a refuge for many of the crowd after the shooting began. The

* Read before Section on Historical Interests, A. Ph. A., Indianapolis meeting, 1917.

writer was recently reading the bronze memorial on the corner of this building and was reminded thereby that he could go a long way back into Indianapolis history and pharmacy.

Of later date, there is Herman Frauer, J. B. Dill, Doc. Snyder, Sigman Muhl, Adrian Bowens, W. W. and J. M. Scott, Robert P. Blodau, George F. Traub, Frank H. Carter, Charles Woods, Louis Schulmeyer, Charles H. Schad, M. C. Staley and Henry Kielhorn. Dr. J. N. Hurty, as an ethical druggist, with an ethical drug store, was located on the site now occupied by the Federal Building. He was succeeded by Hurty-Francis and this firm by J. R. Francis Company.

Many of the stores mentioned have disappeared and in many instances the sites are not known to our present generation, a few still remain in remodelled and modernized buildings. Many of the owners have passed away, others are still among the living and doing their bit as good citizens in their every-day work and as members of national, state and local associations.

The writer has not mentioned all who are deserving of mention, but in an experience of nearly half a century has endeavored to touch slightly upon the events and people as he has known them.

SMALL PERCENTAGE OF SOLDIERS DIE OF WOUNDS OR DISEASE IN HOSPITALS.

The War Department authorizes the following statement by the Chief of Staff:

In connection with the casualties among the American Expeditionary Forces in the Marne-Aisne offensive, it should be stated, upon the basis of the officially attested experience of our associates during four years of this war, that of wounded soldiers sent to hospitals for treatment fewer than 1 in 20 die.

Of all the soldiers sent to the hospitals only 45 in every 1,000 die. These include those who die of disease as well as those who die of wounds. Of all soldiers wounded in action more than four-fifths return to service, many of them in less than two months. It is necessary to discharge for physical disability only 14.5 per cent.

These figures are based on an average of both British and French official figures, including both officers and men. The two are averaged together, since American troops are fighting with both the French and the British under conditions which vary.

SIXTY-SIXTH ANNUAL MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, CHICAGO, ILL., AUGUST 13-17.*

ABSTRACT OF THE MINUTES OF THE FINAL GENERAL SESSION.

The Final General Session of the American Pharmaceutical Association was called to order by President A. R. L. Dolme at 10 o'clock A.M., Saturday, August 17. The minutes of preceding sessions were read by Secretary William B. Day, and approved. (See p. 806, September issue.)

The minutes of the sixth session of the Council were read by Secretary J. W. England, and approved. (To be printed under Council Business.)

Secretary Jeannot Hostmann read the report of the transactions of the House of Delegates, reading first the report of the Committee on Federation of the A. Ph. A. (The report is printed in the September issue of the JOURNAL A. Ph. A., p. 812, and as it is necessary to print this again as part of the minutes of the House of Delegates it is omitted here, except the resolutions or recommendations that were changed or amended.)

The resolution relative to the status of delegates to the House of Delegates was changed or defined by giving delegates from associations the privilege of the floor, but no vote unless they are members of the American Pharmaceutical Association at the time they serve.

The resolutions of the Committee on Federation were freely discussed and afterward adopted.

Acting on a motion of H. M. Whelpley and seconded by Otto F. Claus, the following resolution was adopted:

"That the dues of members serving in the Army or Navy may be suspended during the period of the war, provided that such members do not desire to receive the JOURNAL and the YEAR BOOK."

At the first General Session of the Association H. P. Hynson presented for consideration by the Council an amendment to Article III of Chapter VIII of the by-laws as follows:

"And if the number of members of the American Pharmaceutical Association, who are members in good standing of any State Association, shall equal twenty-five per centum of the actual number of members of such State Association, then the reduction shall be five dollars, making the net amount to be paid three dollars." (P. 805, September issue of the JOURNAL.)

The Council asked for a discussion by the House of Delegates on "combination dues" of State Associations and the American Pharmaceutical Association on the basis of 100 percent membership (instead of 25 percent) of the State Associations in the A. Ph. A., the former collecting the combined dues and remitting to the American Pharmaceutical Association its portion of the dues. (See transactions of Fourth Session of the Council.) The House of Delegates considered the subject and recommended to the General Session that the proposition should be discussed by State Associations and their views ascertained before any fixed rules are established. The same agreement was reached in the Final General Session, and therefore Article III, Chapter VIII, of the by-laws was not amended.

ABSTRACT OF DISCUSSION ON REPORT OF THE HOUSE OF DELEGATES.

F. J. WULLING: We want to develop the federations that we have into a more ideal one. For the present there are two, which we hope will merge very soon. The House of Delegates will be, when this motion carries, put upon a much better and more consistent basis, as I see it, and will be responsible for a development along the lines indicated. To hasten that development some work must be done with the state associations. The supposition is that the delegates who were here from the state associations will carry on that work. I say that is the supposition. Are we going to be sure they will do that work? Are we sure, I mean, or is it the intention to use any part of our organization to help them? I would like to be certain that the

* Continued from page 810, September issue.

matter will not be left just with the delegates, because some of them may forget about it. Some have not been here, and may not come into possession of the information that those have who were here. I would also like to suggest that the American Drug Trade Conference, which is the other line of the development of federation, be helped and stimulated by this Association. I suggest that be done. Now, I have no doubt the officers of the Association will be entirely able to determine. I believe the name American Drug Trade Conference is no longer a good title for that body. I think now that it has been enlarged it ought to be called by another name. I do not want to suggest a name,—possibly American Pharmaceutical Conference would be a sufficient title. The point I am making is that we are being watched,—I mean now the body-pharmaceutic is being watched, even investigated by sources outside of itself. We must be certain that we properly represent ourselves. The name Drug Trade does not represent the entire body-pharmaceutic, but only a part of it, and my suggestion is that a new title be chosen that will be more inclusive, and that this Association take some steps toward that end, if that be necessary.

H. V. ARNY: The particular reason of the suggestion that the Federation Committee be continued is that it is clearly, to my mind, the function of this Federation Committee, having brought the work to this step, to continue on the same lines, and particularly the idea of strengthening the federation through the state pharmaceutical associations. I feel that the Committee will be an absolutely useless organization unless it very actively and aggressively continues work along that line. Dean Wulling seems to think that it is important to consider a special committee to take care of this. I think this can be accomplished by continuing the Committee on Federation. As far as changing the name of the Conference is concerned, that is a detail which will have to be solved by the representatives in that body. There is a promise on the part of the members of the Drug Trade Conference that the scope is to be broadened by including the N. A. B. P. and A. C. P. F., and when that is brought about it will mean a reorganized Drug Trade Conference, at which time this question of change of name may be considered.

EDWARD DORSEY: I would like some light on the matter of bringing our State Association members into affiliation with the A. Ph. A. When we go before our State Association we can not pledge this Association to a specific action at this time. We can not represent one hundred percent membership in our State Association. The matter must be taken up individually. Propaganda work is very necessary. There are some state associations that were not able to meet for the reason of having no delegates at this meeting, or at least not all the delegates were here; some have gone away; some state associations did not hold meetings last year; maybe some will not hold meetings next year. I would suggest that as a number of associations issue bulletins that reach every one of their members, these be asked to help in the propaganda. I will be glad to look after the publicity in Kansas. It seems to me it should be the duty of the Secretary of the A. Ph. A. to get up a very comprehensive statement and ask that it be published in the various state journals. Some do not have a state journal but they have officially adopted some journal; one or the other is true in nearly every state. If such publicity is given it would be very much easier for those that are members of the A. Ph. A. to further the adoption of the plan. If we had a plan outlined that would go into detail relative to questions that might be asked on the subject it would be helpful. I think this body should make it specific so that if we do not succeed in getting in 100 percent of our state association members,—what their position will be, will be made very plain. I would suggest to the Secretary of the A. Ph. A. that he write up this plan in detail, and that it be published in pharmaceutical and drug journals, bulletins, proceedings, and every possible means for publicity, so that all druggists will get the information and without misunderstanding. Then we can go before the state association and present the matter.

CHARLES H. LAWALL: Mr. Chairman, it is not in order at this time to make a motion because there is a motion before the House, but I think when the proper time comes it will be entirely in order to make a motion that the Secretary be authorized to take the matter up for consideration by the Council with the idea of evolving some kind of definite plan which can be laid before the membership of the various state associations. Now in my mind I am of the opinion that this educational work of bringing into line the membership of the state associations can best be accomplished by combining the publicity afforded by the bulletins issued by many of the state associations, with a subsequent call for expressions of opinion by means of

a vote when the annual bill for dues is sent out. After giving proper publicity to all members, when bills are sent out to the associations they might have annexed to them a postcard with the request that they vote yes or no as to whether they would accept membership in the American Pharmaceutical Association on such basis. In that way we can get an expression of opinion which might on the first set of replies show that, say, seventy-five percent were in favor of such affiliation. When that time comes we could put into effect some sliding scale or establish some satisfactory *pro rata* basis.

EDWARD DORSEY: I would like to make one more suggestion. If our Secretary could arrange to plan a propaganda for each month, and present some argument or phase of the question for each month, we would be glad in Kansas to see that it is published in our Bulletin. We would be glad to get it. But it should come monthly, because we do not want to leave the matter for hasty consideration. In the issue before the annual state meeting we want the strongest argument, so there will be a clear understanding by every member of the association.

W. B. DAY: I think Mr. Dorsey has put forth some excellent suggestions here. I had in mind, of course, that the Federation Committee would work this matter out. I was a member of the Federation Committee—I do not know whether I shall be of the next committee, but I will be very glad to coöperate with the members in any way I can. I might say for Mr. Dorsey's benefit, or others who may not have understood the situation quite clearly, that when this matter was first brought up we discussed not affiliation, but merely the rebating of a portion of our dues to members of state associations, provided the total of such members would amount to at least twenty-five percent of the membership of the association. But that would not be actual affiliation with that association, you see; it would be merely putting our membership on a basis of granting a rebate of our dues to members who were already paying dues in state associations. This plan now reported by Secretary Hostmann from the House of Delegates, which I most heartily favor, is of course, somewhat of an experiment. It means that the state associations will be asked to thoroughly affiliate with the A. Ph. A. by taking in their whole membership. It means, therefore, that such state associations as enter into this plan would amend their constitution or by-laws, by-laws presumably, so as to increase their dues by three dollars a year, and then turn in that three-dollar increase in a lump sum to the American Pharmaceutical Association, taking the whole membership in. If that is done—I am secretary of a state association—I know it will be a lot of work. Only about fifteen percent of the members are members of the A. Ph. A. If that is done some members will drop out rather than remain in under increased dues. We would expect to lose some. On the other hand, it is thought that a man will see the great advantage of having the publications of the A. Ph. A. and an opportunity to take part in its affairs. I believe ultimately the state associations would experience greater prosperity than would be possible in the old way. Nearly all, as Mr. Dorsey said, of the state associations publish some kind of a periodical, a leaflet or little journal of one kind or another, a little booklet perhaps, in addition to their annual proceedings, and we will attempt to keep in touch with the state associations through these periodicals either monthly or quarterly, as the case may be, preferably monthly if it can be arranged. I do not expect to see all state associations fall in line this coming year by any means. I think if we get one or two to go in we will be doing very well. We will have demonstrated that the experiment is moving toward success—we will have made a great start. Now if this does not work and we do not get in any state associations, we can go back to some other basis, work by different lines. This is an experiment. We have not provided at present any way of handling the proposition except by state association membership joining *in toto*, joining as a unit.

JEANNOT HOSTMANN: Mr. Chairman, I think you will all agree with me that what we are trying to do here is about the biggest thing that we have ever undertaken, and it is wise to go just a little bit slowly. We have a very good Committee on Federation and I know that there was, in spite of all the work they had to do on the big idea of federation, considerable time devoted, particularly by the Chairman, to this idea of state association federation. I think it would not be just the right thing if we tried to direct or commit ourselves to any particular policy this year. We ought to leave that almost entirely in the hands of that Committee on Federation in conjunction with the officers of the Association, and try to work out some definite plan or several definite plans which can be presented next year. In the meantime the propaganda can be spread among the state associations. I would not like to see the proposition put

forth in such a way that it might, in some state associations, cause a lot of trouble, and as the General Secretary has brought out, even if it was successful and accepted by a number of state associations, it would mean a whole lot of work, changing the constitution, by-laws, and so forth, and I suggest we go about these changes a little bit slowly, and stand behind the Committee on Federation in conjunction with the officers of the House, who are now a continuous body and who really can do something during the year in formulating some plan or plans and bring them forth next year.

F. J. WULLING: We are discussing two questions as though they were one. They are related but they are not the same. The first is the question of increasing the membership by inviting the state associations to cooperate with us, preferably by one hundred percent membership. The second one is the question of stimulating this idea of federation. Now it seems to me the matter is quite simple. The membership question could very probably be handled by the Membership Committee of the Association and the House of Delegates. The question of federation can be handled by the Committee on Federation through cooperation with the members and the officers of the House of Delegates and the general officers. Those are the two separate questions.

H. V. ARNY: I want to supplement particularly what Professor Day said, and point out as an admirable plan of choosing members of the Federation Committee last year, was putting on as ex-officio members, the president and the secretary of the Association. This should be a fundamental practice in making up the Federation Committee. If that is borne in mind there will be no doubt about the Committee being able to handle the problems entrusted to it.

I am not very favorably inclined to Professor Wulling's idea. I want to emphasize that this is not a plan to increase the membership of the A. Ph. A. It is the idea of a *quid pro quo* federation between the state associations and the A. Ph. A. The membership propaganda is incidental. The thing which should be impressed upon the members is, will it not be worth while to raise the membership three dollars and become a member of this greater association; to receive in addition to federation two publications which can not be bought for four or five dollars a year? It is a bargain. This question about one hundred percent—one of my friends sitting by me said we will get ninety percent—that is a detail to be worked out. Every member of a state association is a separate problem for the association secretary to deal with; there are state association men who are back in their dues. We all know some adjustment of that must be made. There will also be a little hitch on life members of state associations coming into the American Pharmaceutical Association. Do not let us bring up those little details. They can be solved. The main point is to figure out whether state associations representing practically one hundred percent, with the discounts you speak of, would not be worth while. Another point brought out, there is no cause for settling this problem next year. Some states are by law so affiliated they can not be brought in. In most states it will mean that necessary amendment of by-laws will have to lay over a year. The delegates from the state associations should talk the matter over in the next state meeting, and in the meantime the subject should be presented in the monthly bulletins or otherwise. I believe one of the strongest points we have is that the Secretary must get in touch with the president of each association to see that he makes this important subject a feature of his annual address. We are making progress; to tie ourselves down to a hard and fast rule would be a mistake.

EDWARD DORSEY: My idea is exactly like that of Dr. Arny, this is not a question of increasing the membership of the A. Ph. A.—I believe in doing that—but by this federation plan the members are getting more for their money, something worth while. We can only do that in a personal way. We want good, strong, representative men to get up and tell the members why they should adopt the federation plan. My idea is to get this propaganda to the state bulletins. The detail is a matter of form; we can work that out; but let us get the propaganda started.

JEANNOT HOSTMANN: Increased membership should be incidental. I am sure none of you want to make the House of Delegates an appendage to the Membership Committee of this Association. The real object of federation should be the immediate arousal of interest of the state associations in the House of Delegates. One hundred percent attendance of delegates is more important at this time than one hundred percent membership. We have a big proposition facing us, let us go slowly and avoid taking any hasty false steps.

Secretary Jeannot Hostmann stated that the matter which had now so freely been discussed was also a subject for consideration before the House of Delegates, and would be included in the minutes, reprints of which would be sent to the delegates and to the officers of State Pharmaceutical Associations. To the question whether one hundred percent membership from State Associations in the American Pharmaceutical Association was necessary for representation in the House of Delegates, the reply was made: "That this was optional; the members thereby secured the benefits of membership in the American Pharmaceutical Association. That provision was made in the by-laws for three delegates from each State Association; they need not necessarily be members of the American Pharmaceutical Association, they have the privilege of the floor but not of vote unless they are members."

The motion made by W. C. Anderson and seconded by H. V. Army, to adopt the report of the House of Delegates, was put to a vote and carried.

Communications, conveying greetings, were read from Mrs. Minnie M. Whitney, President of the Missouri Pharmaceutical Association, and Secretary E. A. Henderson, of the California Pharmaceutical Association.

Chairman J. W. England of the Committee on Revision of the Constitution presented the following report:

REPORT OF THE COMMITTEE ON REVISION OF THE CONSTITUTION AND BY-LAWS.

Your Committee recommends the following changes in the By-laws of the Association:

Amend Chapter X, Article I, to omit the words "Committee on Resolutions" and to include a "Committee on Research," making the Article as amended read:

ARTICLE I. There shall be appointed or elected standing committees as follows: A Committee on United States Pharmacopoeia, a Committee on Transportation and a Committee on Research, each to consist of ten members; a Committee on Pharmaceutical Syllabus to consist of seven members; a Committee on Time and Place of Meeting, a Committee on Ebert Prize, and a Committee on General Prizes, each to consist of three members; and a Committee on Programs.

Amend Article IX, "The Committee on Resolutions," etc., by omitting same

Amend Article X by changing the number of the Article to IX.

Amend Chapter X by adding Article X to read as follows:

"The Committee on Pharmaceutical Research shall be elected by the Council, two members to serve for a term of five years, two for a term of four years, two for a term of three years, two for a term of two years, two for a term of one year, and after the expiration of the one-year term two members shall be elected annually for a term of five years, the Committee on Pharmaceutical Research shall endeavor to promote research along pharmaceutical lines and shall advise the Council as to the use of the research funds of the Association.

Your Committee would offer also certain amendments to the By-laws of the Association recommended by the House of Delegates, as follows:

Amend Chapter XI to read:

HOUSE OF DELEGATES.

ARTICLE I. There shall be and hereby is created a House of Delegates to have and to exercise such functions as may be hereafter specified by the Association.

Change present Chapter XI to Chapter XII.

Change present Chapter XII to Chapter XIII.

Change present Chapter XIII to Chapter XIV.

The amendments were separately read. H. V. Army moved to adopt and Jeannot Hostmann seconded the motion, and after voting thereon the amendments were carried.

Charles H. LaWall asked whether the Chairman of the House of Delegates was constituted a member of the Council. Chairman J. W. England advised that this would require another amendment and could not be acted upon until

next year. It was further stated, however, that the officers of the House of Delegates for this year were already members of the Council, either by election or as representatives from branches.

W. C. Anderson reported for the Committee on Resolutions that only one resolution had been referred to the committee and he moved its adoption; the motion was seconded by Jeannot Hostmann. The report follows:

"WHEREAS, Botanical names are essentially foreign in origin and form and should be dealt with according to the rules of the language to which they pertain:

Resolved, That in the opinion of the American Pharmaceutical Association the Joint Committee on Nomenclature should drop the final 'i' of specific botanical names which retained them in accordance with such rules."

Carried.

INSTALLATION OF OFFICERS.

Before relinquishing his office and prior to the installation of the officers for the ensuing year, President A. R. L. Dohme spoke in part as follows:

"I am sure we all have appreciated during this meeting that we were considering and confronted with a very important and serious matter concerning the future welfare of pharmacy—the great question of federation. While those who have been most encouraged and most enthusiastic in its favor may have some occasion to regret that an adoption of it in some definite form or another was not possible at this time, I feel that they can congratulate themselves that a distinct step in advance was made and that we have practically paved the way for the beginning of this work in a real constructive way. In so far as we have done this I think the Association is to be congratulated, and, the officers of this Association for next year who are about to be installed will have in their hands the consummation of that great question which we all hope will ultimately be settled for the benefit and advantage of pharmacy, namely, the federation of pharmacy.

"On behalf of myself I wish to take this occasion to say that I have greatly appreciated and am extremely grateful for the splendid cooperation which I have received during the last year from all the members, the committees and officers of this Association. Without their help and encouraging support the enthusiasm for the subject of federation would not have been possible. I have found practically from all sides an encouragement and favorable reception of this great idea, launched many years ago by some of our members and from time to time again brought to their attention, particularly by my predecessor in office last year, Dean Wulling. Therefore I believe we can look forward to 1919 for a real constructive year and some real accomplishment for pharmacy, particularly as we hope during that year to get the state associations more or less integrally and enthusiastically connected with our Association. The state associations of this country have about twenty-eight to thirty thousand members, and they are as much interested in the problems in which we are concerned as is possible; their interests are practically our own. In addition to being specially interested only in their local matters as they are now at their meetings, by this cooperation through our House of Delegates their horizon is increased to a more national one, and in so far as it does this, their influence in the affairs of the nation as it pertains to pharmacy is greatly increased.

Proceeding with the installation, President Dohme addressed the President-elect as follows:

"I deem this one of the happiest moments of my life, after having for one year endeavored to honestly and consistently serve this Association for the welfare of pharmacy, that I am able on this occasion to turn over the 'Ship of State' in its present interesting and hopeful condition to a man of ideals such as you possess and a man with the courage of his convictions such as you possess, and a man who I am sure will direct the 'Ship' into channels which will open up great fields of beautiful progress and successful advancement during the year to come. I hand over to you, sir, with great pleasure, this gavel as the presiding officer and place upon you this pin as the insignia of the office of the President of the American Pharmaceutical Association. My hearty congratulations."

President Charles H. LaWall responded:

"Members of the American Pharmaceutical Association, to say that this is a moment of pride is expressing it very mildly. I am indeed sensible of the honor which has been conferred upon me. As a pilot of the 'Ship of State' of the American Pharmaceutical Association I shall try to avoid the rocks which beset the passage of every vessel going through such seas as we are now confronting. I shall not be like the pilot who said that he knew every rock in a certain channel and upon being given the wheel immediately ran the ship aground, and when reproached for that event by the captain saying 'I thought you said you knew every rock in the channel,' 'well,' he replied, 'I did, and that is one of them.' I hope I shall not have to tell you after I have run the ship aground that that was one of the rocks I knew about. I shall use every effort in attaining the ideals for which we are striving and in trying to bring about the consummation or at least furthering the promotion of the plan begun, and I ask for your help and counsel."

President Charles H. LaWall then proceeded with the installation of the following officers: Theodore J. Bradley, *Second Vice-President*; William B. Day, *General Secretary*; Henry M. Whelpley, *Treasurer*; E. G. Eberle, *Editor*; H. V. Arny, *Reporter on the Progress of Pharmacy*; Hugo H. Schaefer, *Local Secretary*; A. R. L. Dohme and Charles E. Caspari, *Members of the Council*. *First and Third Vice-Presidents*, respectively, F. W. Nitardy and Francis Hemm, were absent, and Honorary President O. F. Fuller was not present. The officers installed expressed their appreciation of the honors conferred and added a few words pertaining to their respective offices.

J. W. England moved a vote of thanks to the retiring officers and to all who had contributed to the success, entertainments and hospitalities of the convention. The motion was seconded by H. V. Arny and adopted by a rising vote and the Sixty-Sixth Annual Convention of the American Pharmaceutical Association was adjourned.

GLASSWARE CONSERVATION.

The Conservation Division of the War Industries Board is seeking coöperation of druggists in conserving containers. Such conservation is possible not only by discontinuing many sizes and shapes of bottles but also through uniformity and size of packing boxes. In normal times it is a convenience and desirable to have variety in style and package, but when the Government is aided by discontinuing their multiplicity for the period of the war every druggist will gladly coöperate, especially when the consideration of conference with them is shown.

Related conservation has saved many tons in transportation, cost in manufacture, of fuel and labor, by compactness, needless trimming, avoiding change from the manufacture of one style to that of another, etc. The proposition is, if the manufacturers of bottles can devote their time to fewer styles, and particularly bottles that require least manipulation and material, and that can be most compactly boxed and stored, there will be a great saving all along the line. It is largely a problem of the manufacturers, but retailers can coöperate, and they will.

COMMITTEE REPORTS

REPORT OF THE GENERAL SECRETARY.*

TO THE PRESIDENT AND MEMBERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

Year Books.—Since the last convention the fifth volume of the Year Book has been issued and distributed. Though having the benefit of reviews in all the leading pharmaceutical journals, the sale to non-members has been small. However, a number of libraries now purchase the book each year and it seems likely that this demand will grow.

National Formulary. The sales of the National Formulary, as expected, fell below those of the preceding year, but 6523 copies were sold in 1917 and yielded an income of \$10,973.06. The total sales of the N. F. IV, June 1, 1918, amount to 23,481 copies, with a gross income of \$41,083.50.

A detailed report follows.

A. RECEIPTS AND EXPENDITURES ON ACCOUNT OF NATIONAL FORMULARY IV.

JANUARY 1, 1917, TO DECEMBER 31, 1917, INC.

Respectfully submitted,

WM. B. DAY, *General Secretary.*

REPORT OF THE COMMITTEE TO INVESTIGATE "SHORT-TERM, CORRESPONDENCE, SUMMER, AND OTHER SIMILAR COURSES IN PHARMACY."*

In preparing this report I have divided the whole number of institutions into two general groups, those that are members of the American Conference of Pharmaceutical Faculties and those that are not. The first group presents no difficulties, but handling the second group is an entirely different matter. In the United States there are seventy-one colleges registered or accredited by New York and we know of twenty-one other institutions or individuals giving instruction in pharmacy. Making allowance for some that we very likely have not heard of, the grand total must be well above ninety.

I have classified these non-Conference schools that give short courses by states, giving such specific information as we have been able to obtain, including name and location, length and number of courses in a year, tuition and some other statistics. From the correspondence and other literature I have been able to summarize the information and draw some general conclusions that I have embodied in the report.

CONFERENCE SCHOOLS.

As far as it was possible to determine there are only eight of the forty-four Conference Colleges that give any sort of short course. A few others reported that they had done so at some time in the past, but had discontinued the practice. Four of the eight, the College of Pharmacy

* From report of a committee appointed by the American Conference of Pharmaceutical Faculties, read before that body and also before joint meeting Section on Education and Legislation, A. Ph. A.; National Association of Boards of Pharmacy, and A. C. P. F., Chicago, 1918.

of the City of New York and the Colleges at Michigan, Wisconsin and Nebraska Universities, conduct summer sessions in which they give courses the same as or similar to regular courses. At Nebraska the courses are regular in every particular. Michigan's catalogue states that there are "no formal entrance requirements" and that these courses "are open to all those who are qualified to pursue them with advantage. Credit may be applied toward a degree at any subsequent time, when the student becomes a candidate for a degree." Wisconsin's catalogue says "Students who do not desire to become candidates for a degree need not comply with the entrance requirements. They may register in any course or courses the work of which, in the estimation of the instructors in charge, they are able to carry with advantage. Credit toward graduation, however, will be given only after regular matriculation." Of the work, they say, "These courses are given primarily for the benefit of apprentices employed in drug stores, who wish to avail themselves of the opportunity to do university work in practical pharmacy." At the New York College the entrance requirements are the same as for regular courses and no credit whatever is given toward a degree.

Three schools, Kansas and Wisconsin Universities and Highland Park College, Iowa, conduct correspondence courses through their extension departments. Some of these are for those who wish to become registered pharmacists and some are technical courses and under certain conditions may count toward a degree. The course at Kansas "is designed for prospective students and apprentices," that is, "to help students to prepare for a pharmacy course" and not as a preparation for State Board examinations. The course is not controlled by the School of Pharmacy but is entirely under the supervision of the Correspondence School of the University.

The School of Pharmacy at Corvallis, Oregon, offers what they call a "Vocational Course, requiring two years of High School work for entrance and not leading to a degree. It runs through two years (length of year not stated, presumably the same as the regular year) and is intended for drug clerks who possess the amount of practical experience required by the majority of State Boards of Pharmacy and who wish to review the work preparatory to entering upon the examination demanded for registration as licensed pharmacists."

Highland Park College in Iowa gives what it entitles the "Best Possible Short Course—Six Months." Some paragraphs from their catalogue will give the desired information better than any comment of mine. "Anyone who expects to become a registered pharmacist can not do better than to complete a course of not less than a total of fifty weeks leading to a degree and a diploma. The pharmacy graduate is broader and better educated because of it. But there are many who have had store experience, but lack the technical knowledge necessary to meet state board examination requirements. Circumstances are such that they are not able to attend college. For the benefit of these persons, this course is designed. It allows them to get the best education possible in a short time and be prepared to pass their state board examination. There are no entrance requirements to this course other than an education equal to eight grades of the public schools. Each student does laboratory work and elects the subject which he needs. We do not recommend the course as a substitute for a regular course in pharmacy. No short course, however practical, is a satisfactory substitute for a complete thorough course. Many students have been able to pass their state examinations after three months in this course, but students are urged to complete as much as possible because of the great value of the course to them. The advantage of this course over 'plugging' courses, which consist largely of quizzing, is apparent. The tuition is much less, time required no longer, and the work done in the course is of great practical value to the student. He is prepared for examination as a fully registered pharmacist."

It goes without saying that the short courses given by the few institutions that also give regular courses are superior in most particulars to the typical short course school. The staff of teachers is larger, there is a real equipment in the way of laboratories and library, the atmosphere must be somewhat different. In fact, beginning with the absolutely regular work given by some of the Conference colleges there is a gradual shading through this group into the characteristic short course given by the typical "plugging" school.

NON-CONFERENCE SCHOOLS.

The non-Conference institutions, twenty in number, are distributed throughout fourteen states, as follows: Arkansas, Iowa, Kansas, Maryland, Minnesota, Nebraska, Oregon and

Wisconsin, one each; California, Georgia, Illinois, Indiana, Missouri, two each; Michigan, three. As you notice, the states are in the central part of the United States except for two on the Pacific coast, one on the Atlantic and one in the South. I have no explanation to offer as to why they are where they are. It occurred to me that some one would be sure to raise the point that they would be most numerous where the standard colleges had very high entrance requirements or large tuition, or both, but that is not the case. They are to be found in those states but in no greater numbers than in other states. One of the number is registered and one accredited by New York and some others give courses of two, three and four years leading to degrees, leaving sixteen that give nothing but the short course.

These schools are hard to classify, each is a law unto itself. They vary in length from six weeks to nine months, the greater number being about three months. Some run continuously and students enter at any time but they are more often timed to have students ready for the periodical Board examinations. The course is then repeated two or three or four times a year. In many cases, individuals are allowed to continue in attendance until they become registered. That alone is the end sought. The smallest tuition is twenty-five dollars for three months, the highest, one hundred and twenty dollars for three months. The schools have been in existence thirty-two years, twenty-four years, twenty years, many, from five to ten years. Almost nothing is said about teaching staff. Sometimes there are two or three, more often one. Entrance requirements, if mentioned at all, get only passing comment. There are none, they say, or, they are only such as are required by the Board in the state in which they wish to take the examination, or, they require a common school education. As the director of a standard college aptly expressed it, "the fee constitutes about the only entrance or scholastic requirement." It is impossible to determine the number of students attending. Much is said about the proportion passing Board examinations but little else. It is fair to presume that there is a goodly number. These people are not in business for the fun of it. One institution, twenty years old, has had eleven hundred students; an individual teaching private classes has had as many (number of years not specified); one, twenty-four years old has had sixteen hundred students; another, seven hundred in eight years; one correspondence school claims to have had twelve thousand students since it was incorporated in 1885. Statements as to equipment are conspicuous by their absence. Blackboards and charts are mentioned several times, the expression "laboratory work" appears once (what sort and how much is left to our imagination), there is one and only one mention of a "well equipped pharmaceutical laboratory."

Some of these do not call themselves schools and such sent no printed literature but simply wrote that they conducted private classes. Possibly these should not be included in this report, but since we were to investigate "short-term, correspondence, summer, and other similar courses," I have so interpreted it. When an individual says that he has had more than eleven hundred students in his classes it can hardly be called tutoring. One of these letters, written by the secretary of an accredited college, I want to quote almost in its entirety. "Regarding your inquiry the College of Pharmacy only conducts the regular two term degree course. However, the writer has had considerable experience with special short course instruction and will start a class about July first. Just finished with both Missouri and Kansas class and have several preparing for the Okla. exam. next month. My price is seventy-five dollars for the course, but if you fail to register, which is not at all likely, with the first two months I will help you again with my next class until you register for that fee. You will need a new U. S. P. or Army or Remington Pharmacy and a chemistry. I have all the drugs for identification and give you the necessary lab. instruction. Had eleven pass the last Mo. and seven last Kans. all with their first course of instruction." Another, written by a man who is Dean of an accredited college, says, "My course consists of about one hundred and twenty-five hours of the following subjects: Chemistry, Materia Medica, pharmacy, toxicology, the pharmacopoeia and pharmaceutical arithmetic. My price for the course is fifty dollars. I have taught over eleven hundred students in my private course. My recommendation is the success with which my pupils have passed the different Board of Pharmacy also the Naval and Army examinations."

It is evidently a lucrative business, witness the beautiful engraved stationery upon which some of these people conduct their correspondence. One of these letters indicates considerable versatility on the part of the author. Besides conducting a ten weeks' class four times a year during two or three evenings a week from seven to nine, his stationery sets forth that he is an

"analytical and manufacturing chemist, analyses, formulas perfected, toxicological work (whatever that may be), expert testimony in legal cases, consultation on chemical problems, preparations duplicated"—all this and more engraved on his letter head.

While one's sense of humor is uppermost, some statements are exceedingly ludicrous but, taken seriously, they are pathetic, even tragic. A man from Arkansas says, "Now it is not necessary that you should have studied Pharmacy before entering school. I have had but few men who have ever seen a school of Pharmacy before entering mine, and really I would just as soon that they did not. Statistics show that only thirty percent of the candidates of the State Board of Pharmacy are successful, but I have an average of eighty percent of successful students. If you fail to pass the State Board, I give you another course free of charge. I have a way of teaching by lectures, charts and actual laboratory work that so simplifies pharmaceutical processes and chemical equations that you cannot help but remember them ever after." All in six months for seventy-five dollars. One wonders what he would take to teach some of us teachers how to do it. Probably this "way" of his is some special endowment that heaven bestows upon a favored few.

Down in Georgia there is a school giving a three months course of which they say, "we have the greatest short course in Pharmacy in the U. S. A."

It has just been reported to us that a certain school has gone out of business and for the state in which the school was located and for pharmacy in general we rejoice. Because their literature shows very well the attempts to make advertising alluring to the uninitiated as well as the kind of instruction offered in a quiz school I am going to quote a few statements, even though the institution no longer exists. Of the course it was said: "The course is not a cram one of State Board questions and answers, but a systematic presentation of the practical parts of a long course in pharmacy. We use the Alphabetic method of teaching. This is a new method. We go from *Acacia* to *Zingiber* and we go over the ground four times." Think of it—four times in fourteen weeks and yet it is not a cram course. In their course of instruction eleven things were enumerated. They were, "Materia Medica, Pharmacology, Chemistry, Preparations, Comment on the Pharmacopoeia, Dictionary, Unofficial Materia Medica, Laboratory Work, State Board Questions."

From Iowa comes this statement: "Between five and six hundred men from this school have registered in the various states during the past six years and the average time they spent in school was between twelve and thirteen weeks. These students show as good a knowledge of their subjects in the examinations as do the average graduates of the regular colleges. They just as frequently write the highest grades in the examinations as do the graduates of the regular colleges. Almost every one who comes to this school has had sufficient practical experience to entitle him to take his state examination. Many of the graduates of the regular colleges have never had any practical experience in the drug business. The course of instruction in the ——— school is adapted to the needs of the man with practical experience. It is manifestly unfair to compel him to take his instruction with those who have never had a day's experience in the drug business." Note that last sentence. Is it not a clever appeal to the vanity of many a drug clerk? To continue, "If one is inclined to doubt the thoroughness of the instruction in the ——— school, and to question the possibility of covering all the practical features of a regular college course in a three months' term just remember that more men from the ——— school have registered in the various states during the past six years than have been graduated by any of the regular colleges of pharmacy with the exception of the Philadelphia, New York and Brooklyn colleges. It is a significant fact that during the past two years thirty-two students from other schools and colleges of pharmacy have attended the ——— school. Twenty-nine of these are now registered pharmacists." The subtlety of such advertising is apparent to you all, I am sure, as well as the fact that there is no logic in such argument to those who know conditions.

Out in Kansas there is a school which has a slightly unusual attitude toward previous education, in that it seems to bid especially for people who have attended colleges of pharmacy. Its director says, "The better the educational advantage of the student, the easier it is to complete the work in a short time." Then a list of names and addresses is given together with the colleges attended. It is claimed also that from fifty to sixty percent of those passing Kansas and Oklahoma Boards are from this institution. In the previous nine months there were "received one hundred and thirty-five tuitions for the instruction of students and all of these are holding

certificates as Reg. Ph." Moreover, "My work ranks with universities and I wish to keep it up to that standard. Students not satisfied with the instruction received in my classes may have their money refunded at the end of the course. I have made this guarantee for many years, and in no instance have I failed to prove the quality of my work. My boys and ladies are such a good boost that I find advertising unnecessary." There are three, three-months sessions for those taking Kansas examination and as many for the Oklahoma examinations, at one hundred and twenty dollars per individual, and a six weeks review course for sixty dollars begins six weeks prior to each examination.

The letters from the president of a Maryland institution are still different. Almost as much is said about his publications as about the class work. He writes, "Why not get my first volume of the quiz book which is now issued in paper cover and comprises seventy pages of questions and answers like the specimen pages herewith enclosed. This book costs one dollar post-paid and the amount so paid is credited on your tuition when you enter the resident work. If you contemplate entering it will pay you well to get my book and whether you enter or not, the book is worth many times the price to the student preparing for the State Board of Pharmacy. I hope to hear from you by return mail ordering the "——— Quizzer," and he appends to his signature "author of several books."

Down in Missouri there is a school which sends a contract in which it agrees to do several things of interest to us. "(1) If the student completes the Extension Course in Pharmacy under the direction of ——— and then fails to gain registration in ——— (blank for state) at one of the two examinations to which his fee entitles him, ——— agrees to refund the total amount of tuition paid. (2) The student may transfer or sell the Extension Course to anyone without extra expense, provided that he has it fully paid for and not more than three-fourths used. (3) Should the student decide to attend the Resident School at any time, he will be given credit for the full amount which he has paid for his Extension Course, provided he has his Extension Course fully paid for." It is called a Practitioner's Course, requires from six to eight weeks and costs seventy-five dollars.

In spite of the fact that a few of these institutions giving short courses are not open to criticism and in spite of the other fact that the literature of others leaves so much to conjecture, enough is known to make it evident that the typical short course schools are doing pharmacy no good. From the standpoint of any particular standard college they might be ignored but the profession as a whole cannot afford to do that. The public has these registered pharmacists thrust upon it and only the recording angel knows how many fatalities are traceable to errors of incompetents. Then the good name of our profession is besmirched. How can we expect professional standing while such a condition exists? Some of the institutions that are in states where prerequisite laws have been enacted must soon be singing their swan songs unless under stress of present war conditions some reactionary legislation is obtained. Obviously, this is no time for those of us who want to see pharmacy receive the recognition the real thing deserves, by the Government and by the people, to "fall asleep at the switch."

EDITORS NOTE.—The part of the paper which included a list of the schools and statistics concerning them and which was a necessary feature of the report to the American Conference of Pharmaceutical Faculties is omitted since it would probably be of little interest to the general reader.

Miss Cooper desires to say that the other members of the committee, Prof. Charles O. Lee and Prof. A. W. Linton, rendered valuable assistance in obtaining the necessary facts for this report. In quoting from literature of the schools, the capitalization, abbreviation, etc., have not been changed in the copy.

REPORT OF THE COMMITTEE ON THE PHARMACEUTICAL SYLLABUS.*

TO THE AMERICAN PHARMACEUTICAL ASSOCIATION:

The Committee on the *Pharmaceutical Syllabus* respectfully submits the following report:

At a well attended meeting held in Indianapolis on August 29, 1917, Dr. Willis G. Gregory tendered his resignation as chairman and insisted that it be accepted, which was done with great

* Read before General Session, A. Ph. A., Chicago meeting, 1918. The item of expense was referred to the Council.

regret, as he had served the Committee as chairman since its inception, and during the difficult formative period while the first two editions of the *Syllabus* were prepared and published. Dean Theodore J. Bradley, of the Massachusetts College of Pharmacy, and Professor Clyde M. Snow, of the University of Illinois School of Pharmacy, were elected Chairman and Secretary-Treasurer, respectively, and it was decided to proceed with the preparation of a third edition of the *Syllabus* to become effective in 1920.

New members of the Committee have been appointed during the year as follows: Edwin L. Newcomb, of the University of Minnesota College of Pharmacy, from the American Pharmaceutical Association; Otto W. Osterlund, of Philadelphia, Pa., from the National Association of Boards of Pharmacy; and Albert Bolenbaugh, of the Medical College of Virginia School of Pharmacy, Richmond, Va., from the Conference of Pharmaceutical Faculties. Professor Bolenbaugh was later given leave of absence because of having been commissioned in the Sanitary Corps of the United States Army.

Bulletins sent by the Chairman to members of the Committee, from time to time, have been published in the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, which has thus provided the necessary publicity for our work.

The following sub-committees, to have charge of the revision of the three principal sections of the *Syllabus*, were appointed in November:

Materia Medica: H. H. Rusby, Chairman; M. C. Beebe, G. M. Beringer, John Culley, E. E. Faulkner, C. B. Lowe, E. L. Newcomb.

Chemistry: J. A. Koch, Chairman; P. G. Albrecht, T. J. Bradley, E. G. Eberle, C. W. Johnson, O. W. Osterlund, C. H. Skinner.

Pharmacy: W. H. Rudder, Chairman; W. C. Anderson, Albert Bolenbaugh, G. C. Dickman, W. G. Gregory, H. B. Mason, C. M. Snow.

The work of the Committee has been greatly hampered by the difficult conditions due to the war, but substantial progress has been made on the work; the sub-committees have about completed the revision of their several sections and are expected to submit them soon to the whole Committee for final revision and adoption. It has been decided to prepare a tentative outline for an additional year of work leading to the degree of Pharmaceutical Chemist, and some of the necessary work on this has been done.

A year ago the Committee paid off all of the indebtedness incurred in connection with the issuance of the second edition of the *Syllabus*, and there is now a small balance in the treasury which it is hoped will accumulate sufficiently so that no long continuing debts need be incurred when the third edition is issued. With this end in view, the Committee requests and recommends that your organization continue its annual contribution of twenty-five dollars towards the necessary expenses of the work of the Committee.

Signed,

THEODORE J. BRADLEY, *Chairman*.

AUGUST 1, 1918.

REPORT OF THE COMMITTEE ON COMPULSORY HEALTH INSURANCE.*

Compulsory health insurance still remains one of the most vital issues affecting the drug trade of the country, but there is little to report at this time in addition to the data contained in the paper read at the Indianapolis meeting last year by the Chairman of this Committee. During the past winter only four State legislatures were in session, and the proponents of the idea therefore lacked the opportunity to carry on a vigorous legislative campaign. In the meantime, however, they have not been idle. They have carried on their propaganda in all sections of the country, and it needs no prophet to see that during the coming winter a bill providing for the enactment of compulsory health insurance will make its appearance in practically every legislature throughout the country. It will then be the duty of the drug trade to organize an opposition and do what it can to pull the fangs of this German-made scheme.

At the present time the most dangerous situation exists in the State of California. Sentiment seems to be more in favor of health insurance there than elsewhere, and the advocates of the idea are concentrating their fire in order to get a law enacted in one State before making

* Read at the second General session, A. Ph. A., Chicago meeting, 1918.

a big drive elsewhere. California therefore becomes the initial battle-ground. It occupies the front trenches, and if the line breaks the Huns will rush over into other States.

The situation in California is a little peculiar. Before a compulsory health insurance measure can be enacted the State constitution must first be amended. We understand that an amendment goes before the voters this fall and that the State-wide campaign now being conducted is for the purpose of showing the necessity of this constitutional amendment. If the amendment is approved, the battle will then be carried into the legislature, and a well-organized effort will be made to secure the enactment of a drastic law. It behooves the druggists of California not to wait but to assist immediately in the campaign against the adoption of the constitutional amendment, and, if that passes, to carry their opposition subsequently into the legislature.

The people must be told the truth about compulsory health insurance. As a matter of fact, it has recently been discovered that the whole propaganda originated in Germany. During the years prior to the present war Germany was out after world trade. She was ambitious to conquer international markets. The great stumbling block was American competition. How could she lessen it? One brilliant method would be to foist compulsory health insurance on the United States and thus greatly increase the national cost of production. Not only, moreover, did Germany initiate such propaganda efforts in this country, but in every country where she suffered keen competition.

An international society was established to foster the idea. Apparently the whole movement was educational. It was ostensibly altruistic. As much as she could, Germany kept in the background and used others to pull her chestnuts out of the fire. Her own connection with the movement has never been frankly proclaimed, but Dr. Frederick L. Hoffman, in his early investigations of the subject, found every trail running straight to Berlin.

The fact is that Germany has been saddled with the economic burden of compulsory health insurance for many years. She couldn't escape it. The Socialist party foisted it upon her. It greatly increased her own cost of production, and the only thing she could do was to equalize matters by getting compulsory health insurance adopted likewise in other countries.

Certainly it is an ironical situation that confronts us at the present time. On the one hand, we are at war with Germany. On the other, we are earnestly discussing a German movement and are seriously considering the adoption of it. If we defeat Germany on the field of battle, we still run the risk of being beaten by her at home. Because, if the United States adopts compulsory health insurance, it will so add to the cost of production as to make it relatively simple for Germany to compete with us in the markets of the world after the war is over. If we take up with this insidious movement, we shall be playing directly into Germany's hands.

Druggists, even more than other classes in the community, are threatened by this menace. For, if compulsory health insurance ever becomes a fact, it would mean nothing less than that three-fourths of the people of the State would get their drugs from the State itself—and not only their drugs but their medical, dental and surgical service as well. Seventy-five percent of the druggist's business would fly out of the window. Not only that, but his taxes would be quadrupled. The retail drug business as we know it to-day would be practically driven from the field. Only the strongest would be able to survive, and the great majority of druggists would find their occupations gone.

These sound like the statements of an alarmist, but they represent nothing but the truth. If there was ever a time when the druggists of the country should be awake to their own interests, that time is now and here. Organized opposition to compulsory health insurance should be perfected in every State in the Union, and wherever a health insurance bill makes its appearance, it should be fought with all the energy and vigor at our command.

Respectfully submitted,

HUGH CRAIG,
C. A. MAYO,
FRANK H. FREERICKS,
J. H. BEAL,
W. C. ANDERSON,
HARRY B. MASON, *Chairman*.

REPORT OF COMMITTEE ON QUALITY OF MEDICINAL PRODUCTS
AMERICAN PHARMACEUTICAL ASSOCIATION.

(Continued from September, No. p. 817.)

DOGGRASS: Oftentimes an excessive amount of stem bases and rootlets are present. If gathered in America it is apt to be the rhizome of any species of the genus *Agropyron*. Bermuda grass has been cut to simulate doggrass and imported and sold as such. The substitution is readily detected by the absence of the bright yellow rhizomes of the genuine and the excessive amount of tracts and rootlets. It may be imported under its proper name of Bermuda Grass.

O. A. FARWELL.

ERGOT: Samples yielded to the official fluidextract menstruum 15.6%, 13.3%, 15.8%, 16.8%, 16.9%, 14.6%, 19.3%, 13.3%, 16.06%.

E. L. PATCH.

EUPHORBIA PILULIFERA: There is great variation in the products sold under this name. In material particulars they differ from the N. F. description.

E. L. PATCH.

FENNEL: Examination of samples has disclosed the fact that bitter fennel, from *Foeniculum piperitum*, Sweet., has been substituted in some instances for the true material. This species is not cultivated and may be distinguished by its very much smaller size and the decidedly bitter taste and flavor of its volatile oil. U. S. Department of Agriculture. Ash 8.95%, 9%, 8.5%, 9.2%.

E. L. PATCH.

FROSTWORT: *Lechea major*, Mx. is often collected and put on the market under this name. The true frostworts are species of *Trichasterophyllum*.

O. A. FARWELL.

GADUOL OR MORRHUOL: Much has been offered differing from the product originally marketed under this name. Claim—"An alcohol extract from Cod Liver Oil." Original sp. gr. 0.944; characteristic odor; greenish black color. Soluble in equal volume of 95% alcohol. Insoluble in water. Washed with water acidulated with hydrochloric acid the washings give an abundant precipitate with Mayer's solution and solution of iodine.

Sample 1: Sp. gr. 0.920; odor like original; color like original. Does not give any alkaloidal reactions.

E. L. PATCH.

Sample 2: Odor different from original. Not as dark in color; slight precipitate with iodine solution, none with Mayer's.

E. L. PATCH.

GELATIN: Three shipments had to be rejected on account of the presence of an undue amount of arsenic.

H. ENGELHARDT.

Contained zinc, and zinc and copper.

U. S. DEPARTMENT OF AGRICULTURE.

GENTIAN: The roots of various American species of gentian and of the western species of *Frasera* have been offered as substitutes for the official gentian.

O. A. FARWELL.

GINGER JAMAICA: Alcoholic extract, 5%, 3.5%, 6%, 5.8%, 9.3%, 8%, 6.5%, 4%, 4.5%, 6.9%, 6.3%. Ash 4.8%.

E. L. PATCH.

GOLDENSEAL: Of five shipments only one had to be rejected, containing only 0.71% of ether-soluble alkaloids.

H. ENGELHARDT.

One sample 3.18%.

E. L. PATCH.

GRINDELIA: Extractive 41%; average 36%. Ash 9%. Extractive 43%; ash 9%.

E. L. PATCH.

GUAIAIC RESIN: Ash 4.89% very little soluble in alcohol. Ash 3.83%, alcoholic extract 38.3%; ash 3.5%, alcoholic extract 23.9%.

E. L. PATCH.

HELLEBORE AMERICAN: Assayed by method of Department of Agriculture given for white hellebore, alkaloidal contents were 2.05%, 1.36%, 1.333%, 2.07%, 2.3%.

E. L. PATCH.

HYOSCYAMUS: Sixteen shipments were examined, of which nine assayed below U. S. P. strength. One shipment marked "herb" assayed as much as 0.235% of total alkaloids; this sample consisted of stems, leaves and roots. The leaves assayed 0.115% of mydriatic alkaloids.

H. ENGELHARDT.

"Stems," 0.052%. Leaves by U. S. P. IX method 0.069%, 0.044%, 0.068%, 0.054%, 0.09485%, 0.214%, 0.156%, 0.021%, 0.027%, 0.1446%, 0.0752%, 0.0867%, 0.108% (U. S. P. 0.065%).

E. L. PATCH.

HOREHOUND: Examination of importations has disclosed that in some instances *Ballota hirsuta*, Benth. was substituted for *Marrubium vulgare*.

U. S. DEPARTMENT OF AGRICULTURE.

IODINE TINCTURE: U. S. P. 6.5 to 7.5 Gm. iodine in 100 Cc., 4.5 to 5.5 potassium iodide in 100 Cc.; 7.69 I, 7.11 I, 7.51 I, 6.98 I, 7.32 I, 7.15 I, 7.1 I; 7.3 Gm. I, 4.85 Gm. KI, 6.77 Gm. I, 4.795 KI.

E. L. PATCH.

IPÉCAC: Of fifteen shipments of Carthagena, four were below official standard. Of nine shipments of Rio, 2 were below.

H. ENGELHARDT.

2.09%, 2%, 1.95%, 2.28%, 2.01%, 1.92%.

E. L. PATCH.

IRON ARSENATE: Had to be rejected on account of containing ferric arsenate.

H. ENGELHARDT.

IRON CACODYLATE: A small shipment of this chemical had to be rejected on account of giving a dark red solution with water.

H. ENGELHARDT.

IRON DIALYZED: We experienced quite a difficulty with this preparation. Two lots had a cloudy appearance and did not readily mix with water.

H. ENGELHARDT.

IRON REDUCED: Some shipments contained excess of sulphides. They contained about 95% of reduced iron when determined by the U. S. P. process.

H. ENGELHARDT.

94% reduced iron, slight excess of sulphide; 94.34%, 92.1%, 85.14%, 90.8%.

E. L. PATCH.

JALAP: The quality of this drug was all that could be desired. Only two shipments of ten had to be rejected on account of assaying less than 7% resin. One sample was submitted which apparently was Tampico jalap. It differed only in shape from the official drug and assayed 18% total resin of which only 4% was soluble in ether.

H. ENGELHARDT.

7.65%, 3.65%, 7.15%, 7.1%, 5.6%, 16.8%.

E. L. PATCH.

JALAP RESIN: One sample, only 78% soluble in alcohol, 28% soluble in water. Rejected. Another, 96% soluble in alcohol, 10% in water. Rejected.

E. L. PATCH.

JUNIPER BERRIES: Berries of the western species of that section of *Juniperus* including *J. scopulorum*, have been gathered and offered for juniper berries.

O. A. FARWELL.

Shipments in many instances contained a considerable number of discolored and withered berries. Should not contain more than 10% of immature, discolored, and withered berries or foreign material.

U. S. DEPARTMENT OF AGRICULTURE.

LICORICE ROOT: Shipments of licorice root have been imported which proved to be derived from *Glycyrrhiza uralensis*, an Asiatic species, not recognized in the U. S. P. but equal in every respect to the official. By a ruling of the Department of Agriculture this can be imported if properly named and stamped "not U. S. P." which means it can be used for non-official preparations. Since the beginning of the war licorice root has steadily deteriorated. Culls are frequently included and the stems even to a very large percentage.

O. A. FARWELL.

| | |
|-------------------------------------------------|-------------------------------------------------|
| Extractive 29.4%, Ash 6.8% (U. S. P. limit 7%). | Extractive 21.4%, Ash 7.4%. |
| Extractive 24.6%, Ash 6.8%. | Extractive 31%, Ash 8.8%. |
| Extractive 26.96%, Ash 6.4%. | Extractive 36%, Ash 8.55%. |
| Extractive 40.3%, Ash 5.92%. | Extractive 24%, Ash 10%. |
| Extractive 27%, Ash 8.6%. | Extractive 8.34%, Ash 3.5% (not licorice root). |
| Extractive 28%, Ash 6.6%. | Extractive 30.32%, Ash 8.6%. |

LICORICE EXTRACT, POWDERED: Extractive 79.2%, Moisture 6.2%, Ash 4.6%.

E. L. PATCH.

LIME CHLORINATED. Standard 30% chlorine.

20% available chlorine. 8%, 10%.

34% available chlorine 30.7%, 33.7%.

27.01%, 26.97%, 32.98%, 33.24%, 31%, 32.27%.

34.75%, 34.75%, 30.48%, 30.48%, 31.56%.

E. L. PATCH.

LOBELIA: Alkaloid 0.52%, 0.5%, 0.54%, 0.56%, 0.5%, 0.56%, 0.6%.

E. L. PATCH.

LUPULIN: Six shipments were examined of which two were rejected. One yielding 16.7% ash and one yielding 40% of ash and being soluble in ether only to an extent of 44.1%.

H. ENGELHARDT.

MAGNESIUM CARBONATE: Water soluble 0.015, U. S. P. 0.01, CaO 0.88% (U. S. P. 0.88), MgO 39.46% (U. S. P. 39.2%). Water soluble 0.014, CaO 1.95, MgO 40.40%.

E. L. PATCH.

MAGNESIA, CALCINED: MgO 94.28%, moisture 4.32% (U. S. P. MgO 96%).

MgO 95.45%, moisture 3.2%.

MgO 94.64%, moisture 6%.

MgO 89.3%, moisture 2.69%.

MgO 92.8%, moisture 6.45%.

E. L. PATCH.

MALE FERN: Extract of male fern adulterated with 25% castor oil. It contained only 8% crude filicin instead of 24%. *The Apothecary*. Oleoresin. This article is practically unobtainable. We succeeded in obtaining a few lots but these had to be purified on account of assaying less than 27% of crude filicin, the requirement for good oleoresin of male fern.

H. ENGELHARDT.

MANACA: There are two varieties, the red and the white. The red manaca is the one used for medicinal purposes, the white has been imported in considerable quantities. It is distinguished by having a soft, white root, abundantly covered with small flakes of cork of a tissue paper thickness.

O. A. FARWELL.

MANGANESE DIOXIDE: Two shipments assayed only 70.7% and 76.8% of MnO₂.

H. ENGELHARDT.

MATICO: Has been substituted by the leaves of *Eupatorium glutinosum* growing in the same regions as genuine matico, *Piper angustifolium*. Careful comparison shows certain differences.

Genuine.

Substitute.

Leaves alternate.

Leaves opposite.

Margin finely crenulate.

Margin serrate.

Base unequal, oblique, subcordate.

Base cordate.

Venation palmate-pinnate prominent below.

Venation pinnate.

Upper surface scarious and finely bullate.

Upper surface scarious and coarsely bullate.

Lower surface pubescent; simple hairs; glandular hairs absent.

Lower surface very woolly, due to numerous long, simple, much twisted hairs; numerous

Subsessile or short petiolate.

short glandular hairs.

Length 10 to 20 Cm.

Petiole 1 to 3 Cm. long.

Breadth 2 to 5 Cm.

Length 5 to 14 Cm.

Breadth 1 to 3 Cm.

U. S. DEPARTMENT OF AGRICULTURE.

MOUNTAIN SAGE: *Artemisia tridentata*, *A. Ludoviciana* and other species of *Artemisia* have been gathered in large quantities as substitutes. Mugwort, *Artemisia Mexicana* has been offered as a substitute.

O. A. FARWELL.

MYRRH: Alcoholic extractive 24.67%, 24.09%.

E. L. PATCH.

NEOSALVARSAN: Ampoules containing starch and salt have been sold for neosalvarsan 15,000 such ampoules were filled in Jersey City. They were put up in packages to imitate the German or English makes.

Apothecary.

NITROUS ETHER, SPIRIT: One hundred and twelve samples below standard.

MASSACHUSETTS STATE BOARD.

NUX VOMICA: Seven lots; total alkaloids, 2.61%, 2.678%, 2.975%, 3.19%, 3.16%, 2.5%, 2.49%.

E. L. PATCH.

OPIUM: Most of the opium received in this country appears to come from Persia. Ten shipments received were of good quality.

H. ENGELHARDT.

Powdered 11.7%, 10.94%.

E. L. PATCH.

PAPAIN: One part digests 13.6 fibrin in neutral solution; 24.1 in alkaline.

One part digests 13.6 fibrin in neutral solution; 24.4 in alkaline.

One part digests 12.0 fibrin in neutral solution; 20 in alkaline.

E. L. PATCH.

PARSLEY SEED: Of ten shipments one was rejected, yielding only 11% ether soluble resin.

H. ENGELHARDT.

PENNYROYAL: This product has been very carelessly collected and frequently contains very large amounts of sand, stems and other foreign material. Pennyroyal leaves should not contain more than 10% stems, more than 16% ash and not more than 6% of acid-insoluble ash (sand).

DEPARTMENT OF AGRICULTURE.

PEPSIN: Two shipments were deficient in proteolytic power.

H. ENGELHARDT.

PETROLEUM BENZIN: Very difficult to find a product meeting the U. S. P. requirements. Much sold under this name has a specific gravity of 0.7400 or more, while the official range is 0.638 to 0.660. The usual product has considerable foreign odor. The Standard Oil Company formerly marketed a "Gas Machine Gasoline" having a sp. gr. of about 0.6508 at 25° C., but they have discontinued it.

E. L. PATCH.

PETROLATUM OILS: White mineral oils of exceptional quality of American source can now be readily obtained. Occasionally they are defective. Two lots would not meet the sulphuric acid test.

E. L. PATCH.

PHENOL: This product is made almost exclusively in this country at the present time and is generally of good quality; however, we received a few shipments which possessed a nauseating odor resembling sulphuretted compounds.

H. ENGELHARDT.

POTASSIUM PERMANGANATE: One shipment contained manganese oxide and another assayed only 86% of absolute salt.

H. ENGELHARDT.

PRICKLY ASH BARK: A common substitute is prickly elder bark (*Aralia spinosa*). It is readily distinguished by taste as it does not produce the acrid or tingling sensation developed by the genuine xanthoxylum.

O. A. FARWELL.

QUASSIA: Extractive 3.3%, 5%, 4%. Ash 2.8%, 3.4%, 3%.

E. L. PATCH.

QUININE SULPHATE: One lot contained a decided trace of other cinchona alkaloids.

E. L. PATCH.

RENNET: Much difficulty was experienced with this product. In regard to its curdling power it would be advisable to give more detailed directions for the assay process, especially in regard to the absence of preservatives in the milk used for testing rennet.

H. ENGELHARDT.

SARSAPARILLA, MEXICAN: Supplies have been more or less curtailed with a consequent rise in price. Many substitutes have been brought forward, some of which are the roots of unofficial species of Smilax. One substitute is the rhizome of some fern. Externally it is black, dorsiventral and when broken crosswise shows a structure similar to that of *Ilex aquifolium*. This is not permitted to enter the country under the name of Sarsaparilla, but considerable quantities have been admitted under the name of "Black Sarsa."

O. A. FARWELL.

SOFT SOAP: Much complaint is entered by physicians as to the color, odor, etc., of the U. S. P. IX product made from cottonseed oil and some insist on the U. S. P. 1900 made from linseed oil.

Two lots gave 0.6% of free oleic acid. Residue 3.5% and 2.9% (U. S. P. 3%).

E. L. PATCH.

SOAP LINIMENT, U. S. P.: Refractive index 1.3750; alcohol 60%. Diluted with water, salted and ether washed 100 Cc. gave 5.3% residue. Evaporation of original 5.4%.

Market sample: Refractive index 1.3702; alcohol 66%. Ether washing 2.7%. Evaporation of original 4.25%. (Half quantity of oils about 80% of soap.)

U. S. P., refractive index at 20°, 1.3771. Evaporation 5.73%.

Sample, refractive index 20°, 1.3770. Evaporation 5.5%.

E. L. PATCH.

SODIUM BENZOATE: No. 1, assayed 99.38%. No. 2, 99.38 sodium benzoate, 0.35 sodium chloride.

E. L. PATCH.

SODIUM CHLORIDE: Worcester salt, moisture 0.5%, NaCl 99.67% (includes CaCl₂).

Prominent name, U. S. P., moisture, NaCl 99% (includes CaCl₂).

Prominent name, U. S. P., moisture, NaCl 97%, contained Ca, Mg and sulphate.

Prominent name, U. S. P., moisture, NaCl 99.2% contained Ca, Mg and sulphate.

Prominent name, highest purity, 99.86%, 99.57%, 99.86%, 99.28%.

E. L. PATCH.

SPIKENARD: Extractive 21%, 7% ash, 24% extractive, 15% ash.

E. L. PATCH.

STRAMONIUM LEAVES: This drug is largely cultivated in this country and out of ten shipments we were compelled to reject only one assaying 0.22% of total mydriatic alkaloids.

H. ENGELHARDT.

Leaves of various unofficial species of datura have been gathered and offered as stramonium. Probably most of the spurious drug comes from *D. meteloides* and can readily be differentiated by the pubescent character of the leaves.

O. A. FARWELL.

0.24% alkaloids, 10.32%.

E. L. PATCH.

The leaves of *Nanthium strumarium* L. have been substituted for true stramonium. They do not contain the characteristic alkaloids of the genuine.

DEPARTMENT OF AGRICULTURE

STYRAX: Soluble in alcohol 82%, 17% volatile matter, 7% residue. Smelled like shoemaker's wax.

E. L. PATCH.

TANSY: The leaf apparently has disappeared, or soon will, from the market. Its place has been taken by the herb, usually cut, which contains an excessive percentage of heavy inert stems.

O. A. FARWELL.

UNICORN ROOT, ALETRIS: Extractive 16.7%. Ash 7.3%. Extractive 12.2%. Ash 9.4%.

E. L. PATCH.

Excessive amounts of total ash and acid-insoluble ash have been found in lots of Aletris. In a few instances the limit of 16% given in the N. F. was exceeded. If properly collected total ash should not exceed 10% and acid-insoluble ash 5%. One lot contained 3% true Aletris and 97% false Unicorn, *Chamaelirium luteum*.

DEPARTMENT OF AGRICULTURE.

VALERIAN: There has been gathered in Mexico and offered for sale as Valerian, a long spindle-shaped root that has the characteristic valerian odor. Needless to say it is not the official drug, which is a fibrous root.

O. A. FARWELL.

VIBURNUM: Nearly all samples of *Viburnum prunifolium*, black haw, have proved to be genuine, while most lots claiming to be *Viburnum opulus* have proved to be mountain maple bark, *Acer spicatum*. Mountain maple bark may be distinguished by its fracture, which is fibrous, while that of Cramp Bark is short and weak, since it has no bark fibers or the fibers, if present, are few and scattered. The barks may further be distinguished by the color which develops when a drop of 1% or 0.1% ferric chloride solution is placed on the inner surface of the bark. After several minutes a blue color develops in the case of mountain maple and a green color in the case of cramp bark, due to the tannin in the bark. If woody tissue is present it should be removed before making the test.

DEPARTMENT OF AGRICULTURE.

WATER PEPPER: This drug is derived from *Polygonum acre* and perhaps *P. hydropiper* the species with acid leaves. *P. Persicaria* and *P. hydropiperoides* are largely used as adulterants and substitutes.

O. A. FARWELL.

WILD CHERRY: The barks of the Rocky Mountain species of cherries have been gathered and offered as wild cherry. The bark is thicker and distinguished by the narrow transverse ridges on the outer bark, in more or less scattered but concentric circles.

O. A. FARWELL.

Four grammes of good bark should yield over 2 minims or 0.124 mls of 2% hydrocyanic acid. Four lots were below this standard. 1.04 minims, 1.37, 0.847 and 1.44.

E. L. PATCH.

WINES: A carload of Sherry Wine was rejected on account of having a cloudy appearance and having an acid reaction due to after-fermentation.

H. ENGELHARDT.

Sherry, alcohol 19.56% volume, 19.16%, 18.16%.

Port, 20%, 19.24% (5.5 Gm. residue from 100 mls) 19.4%.

20.9%, 18.34%.

Malaga, 18.84% alcohol.

E. L. PATCH.

XANTHORRHIZA: The root of this plant is gathered in large quantities and offered sometimes as goldenseal, sometimes as berberis.

O. A. FARWELL.

YELLOW DOCK: Canaigre and the roots of various species of *Rumex* have been offered for the official *Rumex crispus*.

O. A. FARWELL.

YERBA SANTA: Much is offered containing 15 to 20% of large stems, instead of the 5% limit of stem, and inert old or improperly dried leaves.

E. L. PATCH.

ZINC OXIDE: Many lots contain excess of lead.

DEPARTMENT OF AGRICULTURE.

99.27% ZnO, trace only of heavy metals, 99.68% ZnO, slight trace of heavy metals; 99.36% ZnO, 0.1% ZnCl₂, slight trace of iron, no lead; 99.36% ZnO, 0.2% ZnCl₂, no other heavy metals.

E. L. PATCH.

O. A. FARWELL,

Committee.

COUNCIL BUSINESS

COUNCIL MEETINGS.

THIRD SESSION OF THE COUNCIL, 1917-1918.

(Concluded from p. 831, September issue.)

The report of the Committee on Publication was presented as follows:

To the Members of the Council:

The Committee on Publication submits the following report:

Expenditures for the Journal.—The expenditures of the JOURNAL in 1917 for publication, etc., were \$6,282.61, which, with the editor's salary (\$3,500), totalled \$9,782.61, and the total cost of the JOURNAL for the previous year was \$9,123.07 (\$5,623.07 + \$3,500), an increase of \$659.54.

Receipts of the Journal.—The receipts of the JOURNAL in 1917 from advertisements, etc., were \$6,000.73 and for 1916 were \$5,478.21, an increase of \$522.52.

Net Cost of the Journal.—In 1917 the total cost of the JOURNAL (including salaries) was \$9,782.61, and the total receipts were \$6,000.73, making a net cost of \$3,781.88. In 1916 the net cost was \$3,644.86, or an increase in net cost for 1917 of \$137.02. In other words, there were in 1917 over 2,700 members in the Association and the *Journal for 1917 cost the Association practically, only \$1.40 per member per year.*

The credit for this achievement is due to Editor Eberle, who has worked most zealously, not only in keeping down the rising costs of publication and in getting and retaining advertisements—a most difficult task at this time, when there is so much business that no firm hardly wants to advertise—but also, in maintaining the high scientific character of the JOURNAL.

Printing of Journal for 1918.—The contract for printing the JOURNAL for 1918 was continued with the Eschenbach Printing Company, of Easton, Pa., on October 1, 1917, under the same exceedingly advantageous conditions as the contract of 1917 with the same company, and the service rendered has been entirely satisfactory.

Year Book for 1916 (Vol. 5).—The contract for printing the Year Book for 1916 was awarded to the Eschenbach Printing Company, of Easton, Pa., on October 1, 1917; the Eschenbach Printing Company generously consenting to print the 1916 Year Book under the same specifications, terms and conditions as the 1915 Year Book. The book was distributed in May 1918.

Reporter Army states that "the preparation of the Abstracts for the 1916 Year Book was made difficult by the absence of practically all journals from Germany, Austria and even from Switzerland. Abstracts from these sources were obtained from English, French and Dutch journals, and notably from 'Chemical Abstracts,' the editorial staff of which was able to secure sets of the 1916 journals from the Teuton nations." With these aids, the Year Book was as comprehensive as its predecessors.

The 1916 Year Book cost \$2,945.08, including expressage, which, with the salary of the Reporter on the Progress of Pharmacy (\$600), totalled \$3,545.08. In 1915 the Year Book cost \$2,912.51, including expressage, etc., which, with the salary of the Reporter on the Progress of Pharmacy (\$600), totalled \$3,512.51, an increased cost for the 1916 issue of \$32.57.

In other words, on the basis of 2,700 members, the *Year Book for 1916 cost the Association practically, only \$1.30 per member per year.*

The Year Book contains only about one-half as many reading pages as the JOURNAL, the increased relative cost being due to the fact that the Year Book does not carry advertisements.

The JOURNAL and the Year Book, therefore, *cost the Association, practically, but \$2.70 per member per year.*

The JOURNAL and the Year Book represent, next to the National Formulary, the most valuable assets of the Association, and it is important that they be kept so. At the present time the members of the Association are receiving very valuable services from the Editor of the JOURNAL, services which are worth more than we are paying him. We, therefore, recommend an increase in the annual salary of the Editor of \$250. (It should be more.) Our finances, we are assured, will permit the increase.

National Formulary, Fourth Edition.—25,000 copies of the N. F. IV have been printed and bound. Of these the stock remaining on hand on July 1, 1918, were 1,521 7/66 muslin, 588

Buckram and 167 Interleaved). In other words, practically, 23,500 have been sold since the first copy on July 25, 1916. The General Secretary will present in his annual report a statement as to the distribution of the book and the Treasurer in his report a statement as to the receipts and expenditures.

As nearly seven years have passed since the establishment of the monthly JOURNAL of the Association, a sufficient time has elapsed to pass judgment upon the wisdom of its issuance. As the result of its study of the situation, the Committee on Publication believes that the decision to publish the JOURNAL was one of the most progressive steps ever taken by the Association. The results obtained have been more than satisfactory. No apology is needed for the JOURNAL. It stands in the front rank of scientific periodicals and exercises a potent national influence in the important domain of pharmacy and collateral sciences. It has enabled the Association to keep in touch with its membership *each month*, and has accentuated, during the year, the attention, interest and work of the membership. It is in a class of its own, and is the competitor of no other pharmaceutical journal, but the friend of all. It furnishes to its readers nearly 100 pages of reading matter each month, an amount of space that no other pharmaceutical journal of the country could possibly give to the Association, no matter how friendly it might be.

The publication of the JOURNAL marks a great advance over the former Proceedings in the presentation of reports and papers read at the annual meetings, because these are received sooner by the members, relatively, than formerly, and being received monthly, are read through, which was not the case with the annual volumes of the Proceedings, regarded chiefly as a work of reference.

While praising the JOURNAL, the Year Book deserves no less praise. It is the equal if not, the superior, of any other annual report on the progress of pharmacy, and under the able management of its present Reporter on the Progress of Pharmacy, it is worthily maintaining the traditions of its predecessors.

In these two works, the JOURNAL and the Year Book, each in a class of its own—one for the publication of the detailed research work of the members of the Association and the other for the comprehensive review of *all* pharmaceutical literature and research—the Association is following the example and experience of other leading scientific bodies, such as the American Medical Association, the American Chemical Society, the Pharmaceutical Society of Great Britain, and the French Pharmaceutical Society, etc., and it is doing this at an exceedingly reasonable cost to the Association, as the figures previously given show.

In addition, the revision of the National Formulary of the American Pharmaceutical Association is largely based upon the research work of the members of this Association, and the recognition of the book as a legal standard for drugs has brought unusual and deserved prestige to the Association. It is, therefore, peculiarly fitting that, after a proper deduction for the overhead charges of the Association incurred on behalf of the National Formulary has been made, the balance should be kept as a Research Fund (as has been decided upon under Rule 14 of the General Rules of Finance), to be expended for encouraging investigation and research work upon any subject relating in any way to Pharmacy or to the collateral sciences, as may seem proper by the Council; promoting in this way the growth and development of the science and art of pharmacy for the ultimate good of all concerned.

J. W. ENGLAND, *Chairman*.

On motion of Jacob Diner, seconded by S. L. Hilton, the report was received and the recommendation of the Committee on Publication that the salary of the Editor of the JOURNAL be increased \$250 per annum, was referred to the Committee on Finance to consider and report upon later to the Council.

Adjourned until Wednesday, August 14, at 7 P.M.

J. W. ENGLAND, *Secretary*.

FOURTH SESSION OF THE COUNCIL, 1917-1918.

The fourth session of the Council for 1917-18 was held at the Congress Hotel, Chicago, on Wednesday, August 14, 1918, at 7.30 P.M., Chairman L. C. Hopp presiding.

Present: Messrs. H. V. Army, W. B. Day, Jacob Diner, E. G. Eberle, Frank Eldred, E. F. Kelly, J. W. England, L. C. Hopp, J. Hostmann, J. A. Koch, L. A. Seltzer, L. E. Sayre, C. M. Snow, Dr. H. M. Whelpley, and F. J. Wulling.

On motion, the reading of the minutes of the previous session was dispensed with.

Applications for membership from 396 to 402, inclusive, were presented and favorably acted upon. The list was:

- No. 396. Herschel Brian McWilliams, 1100 Grand Ave., Washington, Ind., rec. by C. C. Glover and A. F. Schlichting.
 No. 397. Harry Warren Koch, 3rd Ave. & 74th Sts., Brooklyn, N. Y., rec. by Hugo H. Schaefer and J. Rehfuß.
 No. 398. Harry A. White, Wyoming, Ill., rec. by Wm. B. Day and C. M. Snow.
 No. 399. Joseph E. Dubsky, 1901 West 51st St., Chicago, Ill., rec. by T. H. Potts and Frank Dub-sky.
 No. 400. John R. Elson, 1025 Charles St., Wellsburg, W. Va., rec. by W. P. Porterfield and Wm. B. Day.
 No. 401. Miss Sylvia Ginsburg, 908 S. Ashland St., Chicago, Ill., rec. by Amanda Druehl and Jean Gordon.
 No. 402. Charles T. Root, 806 Lennox Apts., Detroit, Mich., rec. by Leonard A. Belges and A. A. Wheeler.

The Report of the Research Committee was presented, as follows:

REPORT OF THE RESEARCH COMMITTEE, A. PH. A

To the Members of the Council:

In the early part of 1918, the Council approved of the selection of a committee on research consisting of H. V. Arny, G. M. Beringer, J. A. Koch, Henry Kraemer, E. Kremers, C. H. LaWall, F. B. Power, W. L. Seoville, A. B. Stevens and H. M. Whelpley.

Since its appointment, the committee has discussed the problems before it by means of seven bulletins and the question of the wisest methods of administering the American Pharmaceutical Research Fund was discussed from all angles.

The result of our correspondence brought your committee to the view that it would be unwise to formulate, at this early date in the history of the fund, any hard and fast rules concerning minutiae and as a result the following resolutions covering the work that was entrusted to your committee were passed by substantial majorities.

1. *Resolved*, That any award that shall be made shall be assigned for the purpose of promoting those particular topics which in the opinion of the Committee are most worthy of immediate investigation and are most likely to yield practical results.

2. *Resolved*, That the topics for investigation are to be assigned in relation to their importance and to the extent that money is available for their prosecution.

3. *Resolved*, That any particular award shall be made to an individual who shall be adjudged competent to carry on the investigation and who shall be considered responsible for the results or the use of the award.

4. *Resolved*, That the whole sum available in any single year may be awarded to one investigator, or it may be divided between two or more investigators, as may be deemed wise.

5. *Resolved*, That investigators may be selected by the Committee, or may be accepted on application when in the judgment of the Committee such investigators are competent and deserving.

6. *Resolved*, That awards shall be made by the Council upon advice and recommendation of the Research Committee.

7. *Resolved*, That a vote of at least 70 percent of the Committee shall be necessary to carry motions on rules dealing with problems of financial character.

Your Committee desires to call attention to the fact that it is a temporary body, which will go out of existence after this report is received by the Association. That such a Committee should be a permanent one there is no question, and your present Committee therefore recommends that the following amendments be made to the by-laws, creating a standing committee on Research:

That Article I of Chapter X of the By-laws of the Association be amended by adding "a Committee on Pharmaceutical Research," the article to read: "There shall be appointed or elected standing committees as follows: A Committee on United States Pharmacopocia, a Committee on Transportation, a Committee on Resolutions, and a Committee on Pharmaceutical Research, each to consist of ten members," etc.

Also that Article XI be added, to read as follows:

"The Committee on Pharmaceutical Research shall be elected by the Council, two members to serve for a term of five years, two for a term of four years, two for a term of three years, two for a term of two years, and two for a term of one year, and after the expiration of the one-year term, two members shall be elected annually for a term of five years. The Committee on Pharmaceutical Research shall endeavor to promote research along pharmaceutical lines, and shall advise the Council as to the use of the research funds of the Association."

H. V. ARNY, *Chairman*.

On motion of F. J. Wulling, seconded by Jacob Diner, the report was adopted and its recommendation approved.

The following amendment to the By-laws, offered at the first general session of the Association and referred to the Council, was read:

Amend Chapter VIII, Article III, by adding:

"and if the number of members of the American Pharmaceutical Association who are members in good standing of any State Association shall equal twenty-five per centum of the actual number of members of such a State Association, then the reduction shall be five dollars, making the net amount to be paid three dollars."

Making the amended article read:

"Every member shall pay *in advance* to the Treasurer the sum of four dollars as annual dues, and by neglecting to pay said contribution for six successive months may be dropped from the roll of members. If the annual dues (four dollars) and the annual subscription to the JOURNAL (four dollars) be paid at one and the same time, a reduction of three dollars shall be allowed, and if the number of members of the American Pharmaceutical Association who are members in good standing of any State Association shall equal twenty-five per centum of the actual number of members of such a State Association, then the reduction shall be five dollars, making the net amount to be paid three dollars."

H. P. Hynson, present by invitation, explained the intent of the proposed amendment and an extended discussion upon the subject was had.

On motion of H. V. Arny, seconded by Dr. H. M. Whelpley, it was decided that the Council recommend to the House of Delegates a discussion of the subject of "combination-dues" of the American Pharmaceutical Association and the State Associations on the basis of 100 per cent membership of the State Associations, the latter collecting the combined dues and remitting to the American Pharmaceutical Association its portion of the dues.

Treasurer Whelpley made a verbal statement on the payments of dues by members and on the Joseph P. Remington Medal Fund, established by the New York Branch and approved by the Council. It amounted to date to \$1,000 invested in Liberty Bonds.

On motion of J. W. England, seconded by E. G. Eberle, a vote of thanks was directed to be given to the New York Branch for establishing the Fund and the Treasurer of the Association was authorized to keep the Fund as a separate fund and to change the bonds of the earlier issues of the Liberty Bonds into those of the Third Liberty Loan registered and of large denominations.

Adjourned until Thursday, August 15, 1918, at 5 P.M.

J. W. ENGLAND, *Secretary*.

FIFTH SESSION OF THE COUNCIL, 1917-1918.

The fifth session of the Council for 1917-18 was held at the Congress Hotel, Chicago, on Thursday, August 15, 1918, at 5.15 P.M., Vice-Chairman S. L. Hilton being called to the chair in the temporary absence of the Chairman.

Present: Messrs. H. V. Arny, W. B. Day, Jacob Diner, Dr. A. R. L. Dohme, C. A. Dye, E. G. Eberle, J. W. England, J. G. Godding, S. L. Hilton, L. E. Sayre, Clyde M. Snow, Dr. H. M. Whelpley, F. J. Wulling, E. F. Kelly, L. A. Seltzer, F. R. Eldred and Dr. F. E. Stewart.

The minutes of the previous session of the Council were read and on motion approved. Chairman Hopp assumed the chair.

Applications for membership from Nos. 403 to 407, inclusive, were presented and favorably acted upon. The list was:

No. 403. Isidore Edward Chez, 3701 W 12th St., Chicago, Ill., rec. by Wm. Gray and S. L. Antonow.

- No. 404. Edgar Yager Hudson, Shenandoah, Va., rec. by W. F. Rudd and Wm. B. Day.
 No. 405. Walter L. Lyle, Bedford City, Va., rec. by W. F. Rudd and Wm. B. Day.
 No. 406. Wm. O'Neill, 337 W. Madison St., Chicago, Ill., rec. by Wm. B. Day and Ray Whidden.
 No. 407. Robert Templeton Echols, Pullman, Ill., rec. by E. G. Eberle and E. N. Gathercoal.

The Commercial Section passed the following motion at its session on August 15 and referred the same to the Council:

"That the Council of the American Pharmaceutical Association be requested to sanction the appointment of a committee of five to be known as the Committee on Conservation; this committee to consider suggestions regarding changes of formulas to aid in the conservation of glycerin and other products." (A paper read by Hugo Schaefer, of New York, entitled "The Conservation of Crude Drugs," is requested to be referred to this committee if appointed.)

The requests of the Commercial Section were agreed to and the Chairman of the Council was directed to appoint the Committee.

The following recommendations contained in address of Robert P. Fischelis, Chairman of the Commercial Section, were approved by the Section and referred to the Council.

"(1) That the American Pharmaceutical Association take the initiative or, at least an active part, in any movement designed to protect pharmaceutical interests after the war.

(2) In accordance with the rules of the A. Ph. A., the Section on Commercial Interests shall each year propose a topic for discussion by State Pharmaceutical Associations and report on the results the following year. The topic suggested for the ensuing year is "Pharmacy and Pharmacists after the War," and this may include considerations of such question as the help problem, the problem of correct prices, on attitude toward imported merchandise, and similar problems"

On motion of E. G. Eberle, seconded by Wm. B. Day, the action on above request was postponed until a subsequent meeting.

On motion of J. W. England seconded by W. B. Day, Oliver Franklin Fuller, of Chicago, was elected Honorary President of the American Pharmaceutical Association for 1918-19.

E. G. Eberle presented his report as Editor, as follows:

REPORT OF THE EDITOR AND ADVERTISING MANAGER OF THE JOURNAL OF THE A. PH. A.

PHILADELPHIA, August 1, 1918.

To the Council and Members of the American Pharmaceutical Association:

In submitting my report as editor and advertising manager for the year of 1917, I can present nothing new or very different from the report of the Publication Committee.

The total expenses for the year 1917 amounted to \$6,282.61, while for 1916 they were \$5,623.07, a difference of \$659.54, due to the advanced cost of everything that goes into the production of the JOURNAL. There is also an increased cost of \$23.02 for postage, due to the fact that we must mail and remail copy, proof, and pay postage on reprints. The advanced cost of publication accounts for \$470.08 of the \$659.54; the other cost, aside from postage, was for reprints, as the clerical expenses were practically the same.

Our receipts were \$6,000.73 against \$3,478.21 of 1916; part of this increase was due, however, to receipts from reprints. The JOURNAL cost us \$137.02 more than the year previous, or about \$12.00 per issue more.

The year of 1917 was a favorable one for advertising; we had a year's contract for a page from the General Sales Agents of the National Formulary, valued at \$300.00, and advertising on account of the National Dispensatory and other text and reference books.

It should be understood by the members that in these figures no credit is given to the JOURNAL for subscriptions through membership, and we of course persuade most prospective subscribers to become members of the Association. If the JOURNAL were credited with, say, \$2.00 for each subscribing member, then the JOURNAL would pay its own way, including the editor's salary, and pay some money back into the treasury. But this is only for those who look upon the JOURNAL as an expense. All of our work is for the Association, for pharmacy, for pharmacists, for service.

Our receipts from advertising in 1917 were \$5,529.84, exceeding those of the previous year by \$304.27. We need more advertising patrons, we should have them, and can have them, if some of our members will use their influence in that direction.

I have here itemized and scheduled lists of receipts and expenses. Each month every member of the Publication Committee receives a monthly statement. Early this year these statements were audited with those of the treasurer's books and found correct. Bills from the publisher go to the secretary, other expenses are paid by me, and on the signed vouchers I receive my money. All checks received by me are made payable to the Association or the Treasurer.

The JOURNAL has made some progress, and we have reason to be pleased. With this as an analysis I desire to add a few statements and a request for continued coöperation, and also to extend thanks to all the pharmaceutical journals for their coöperation, which we have endeavored to reciprocate. The JOURNAL is in no sense a competitor but strictly a coöperator. Especially commendable was the publicity given for this meeting and doubtless the attendance was influenced thereby and the splendid work of the local committees.

That the JOURNAL is being more and more appreciated is evidenced by those favoring the publication with contributions which they desire to have printed in a Journal of this kind. It occupies as to pharmacy the same place that the Journal of the American Medical Association does to medicine, and that of the American Chemical Society to chemistry, etc. The thing is to provide for greater opportunities—all work together. It is gratifying to report that the attachment for the JOURNAL is growing; never a month passes without letters of favorable comment and encouragement. A very few of the other kind of communications have been received, just one the other day, but it came in the same mail with another from one who, because of the JOURNAL, applied for membership in the Association, which more than offset the discouraging letter. Every member of the Membership Committee uses the JOURNAL and Year Book as a means of getting members, and we all know they are sincere in their expressions, and personally I desire to thank every one of them. It is true there is a percentage of floating membership, but when the 26 deaths of this year represent 574 years of membership, or 22 years average, the former is not so large as some would have us believe.

It is also true that all the papers read before the Association cannot be printed at one time; if they were, many would go unread. But the JOURNAL needs no apology. It needs that, as in a business, we work harmoniously and enthusiastically for it, and it is a great satisfaction that with few exceptions this is the case.

Contrary to a more general view, it has been said that the JOURNAL has little real value for the advertiser. The JOURNAL has advertising value; it has the pulling power of our membership, of pharmacists who are influential in shaping American pharmacy. In some degree it may be an expression of altruism because the advertisers are imbued with the spirit, and I praise them for it, but in the final analysis the advertisers are given full value—exceptional value. So I repeat the JOURNAL has advertising value and our confidence and sincerity are potential in its establishment; the statement is entitled to our unqualified endorsement.

The members can encourage advertisers; the membership comprises members of influence who value the patronage given the JOURNAL. It is for them to tell the manufacturers so; we are promoting the science and volume of their business; we are co-laborers. It is in the advancement of pharmacy, of the drug business, that we are all interested. Let us be loyal. By devotion to the cause we give a lift; by promoting the possibilities of the work of our Association, the Year Book, the National Formulary, the JOURNAL and all of the other endeavors, we improve the service of pharmacy. Let us convey assurance that our Association and every one of its undertakings is worthy of our enterprise, our support; let us say so and act so, without equivocation or mental reservation.

I desire to express my sincere thanks and appreciation for your support, for your continued confidence, and hope that my endeavor and work meet your approbation.

Respectfully submitted,

E. G. EBERLE,

Editor and Advertising Manager.

On motion of W. B. Day, seconded by S. L. Hilton, the report was approved.

Adjourned until Friday, August 16, 1918, at 11 A.M.

J. W. ENGLAND, *Secretary.*

SIXTH SESSION OF THE COUNCIL, 1917-1918.

The sixth session of the Council for 1917-18 was held at the Congress Hotel, Chicago, on Friday, August 16, 1918, at 11 A.M., Chairman Hopp presiding.

Present: Messrs. H. V. Army, W. B. Day, Jacob Diner, Dr. A. R. L. Dohme, Clair A. Dye, E. G. Eberle, F. R. Eldred, E. F. Kelly, J. W. England, R. P. Fischelis, J. G. Godding, S. L. Hilton, L. C. Hopp, C. B. Jordan, J. A. Koch, L. E. Sayre, L. A. Seltzer, Dr. F. E. Stewart, Dr. H. M. Whelpley and F. J. Wulling.

On motion, the reading of the minutes of the previous meeting was dispensed with.

The following applications for membership were received and favorably acted upon:

No. 408. Edward Edwin Swanson, Y. M. C. A., Indianapolis, Ind., rec. by Charles R. Eckler and E. G. Eberle.

No. 409. Clifford Florian Taplin, Milroy, Minn., rec. by E. O. Kagy and E. G. Eberle.

The report of the Committee on Standards was presented as follows

REPORT OF THE COMMITTEE ON STANDARDS.

To the Council of the American Pharmaceutical Association:

Your Committee desires to report that owing to the present conditions due to the War, work on the formulation of standards has been much impeded. This has been due not only to the difficulty of obtaining samples of products in sufficient number to be fairly representative, but mainly to the fact that the time of the different members of the committee is so taken up with important matters connected with the War that it is practically impossible to secure assistance. The committee has, however, tentatively adopted standards for three products, namely:

| | |
|-------------------------------|-------------------|
| Potassium Guaiacol Sulphonate | Strontium Lactate |
| Quinine Hydrochlorosulphate | |

and has prepared and under consideration at this time monographs for fourteen other drugs and chemicals, namely:

| | |
|--------------------------|-----------------|
| Acetylsalicylic Acid | Franciscea |
| Calcium Phenolsulphonate | Malvae Flores |
| Lithium Benzoate | Marrubium |
| Zinc Stearate | Piscidia |
| Quinine Phosphate | Pyrethri Flores |
| Ceanothus | Sandaraca |
| Fabiana | Tonga |

The committee would therefore report progress.

(To be continued)

J. A. Koch, *Chairman.*

SURGEON GENERAL CONTRADICTS RECENT STATEMENT IN CONGRESS RELATIVE TO NUMBER OF DRUG ADDICTS.

The Surgeon General of the Army on October 12, authorized a denial of a report that 200,000 men called in the first draft were drug addicts. The report was based on a speech made in the House by Representative Rainey, of Ohio.

The Representative was chairman of a committee appointed by Secretary of the Treasury McAdoo to investigate the use of narcotics in the army. The inquiry has been on for months, and the Treasury Department is about ready to make public the results. The Surgeon General said:

"The records of the Surgeon General's office show that of a total of 990,592 men examined in the draft up to December 31, 1917, a total of 403 were rejected for drug addiction. To these men may be added seventy-six men discharged for drug addiction after induction and enlistment in the service. From the figures given it may be said that there is no evidence to show that there is an excessive use of drugs by enlisted men and officers of the army."

MINUTES OF A SPECIAL MEETING OF THE NATIONAL DRUG
TRADE CONFERENCE HELD AT THE SOUTHERN
HOTEL, BALTIMORE, MD., ON THE 25TH
DAY OF SEPTEMBER 1918.

Meeting called to order by President James H. Beal at 10.20 o'clock A.M.

The notice of the meeting issued September 11, 1918, was read and President Beal added the explanation that the meeting had been ordered by the Executive Committee at a meeting held August 13, 1918, for a purpose that would appear from the report of the Committee. (See report following.)

The roll was called and showed the following delegates and alternates present:

Representing The American Pharmaceutical Association: John C. Wallace, Samuel L. Hilton and James H. Beal, delegates.

Representing the National Wholesale Druggists' Association: Frank E. Holliday, alternate for Charles A. West; George W. Lattimer, delegate; (C. Mahlon Kline, absent).

Representing the National Association of Retail Druggists: Samuel C. Henry, James F. Finneran and Eugene C. Brokmeyer, delegates.

Representing the American Association of Pharmaceutical Chemists: George C. Hall, B. L. Maltbie, delegates, and Harry Noonan, alternate for Dr. W. C. Abbott.

Representing the American Drug Manufacturers' Association: Dr. A. R. L. Dohme and Charles M. Woodruff, delegates, and R. C. Stofer, also delegate appointed in the place of Adolph G. Rosengarten, resigned.

Representing the Proprietary Association of America: Philip J. Heusler and Harry B. Thompson, delegates, and Frank A. Blair, alternate for Fred. K. Fernald.

The minutes of the last meeting of the Conference as printed and distributed were then ordered approved without reading.

REFERENDUMS.

The Secretary then announced the adoption of the following referendums without a dissenting vote:

1. To appoint the following committees:

A committee on pharmaceutical service in the army and navy.

A committee on national and state legislation regarding alcohol in pharmaceutical products.

A committee on national and state formula and label legislation.

A committee on national and state anti-narcotic legislation, and to confer power on the President of the Conference to appoint alternate delegates to membership on standing and special committees.

2. WHEREAS, Present transportation conditions make it more necessary than ever that the drug trade have the fullest facilities of the mails, and especially the parcel post, and

WHEREAS, The bill to that end introduced in the last Congress known as the Kern-Doremus Bill received the endorsement of all the association members of the National Drug Trade Conference, therefore be it

Resolved, That the Executive Committee of this Conference be and is hereby instructed to effect the introduction of a similar bill in the present Congress and to promote its passage by every lawful means possible; and be it further

Resolved, That to this end the Executive Committee be authorized to expend a sum not exceeding \$200.00 in printing and circulating among members of

Congress, and the medical and pharmaceutical press, proper representations respecting the urgency and justice of such measure.

3. *Resolved*, That this Conference, representing all the pharmaceutical interests of the country, hereby respectfully protests against any increase in the tax upon industrial alcohol—otherwise called non-beverage alcohol—as an unnecessary and unjust burden upon an industry which has been classed as essential to the progress of the war and the health of both the military and civic population; and this Conference further represents and protests that any marked increase in such tax, because of its prohibitive tendency, is likely to defeat the very object of the law and effect a reduction of revenue from this source rather than an increase.

COMMITTEE APPOINTMENTS.

President Beal then confirmed the appointments noticed in Bulletin No. 4, which were as follows:

• Committee on Pharmaceutical Corps: Samuel C. Henry, *Chairman*; Chas. J. Lynn and S. L. Hilton.

Committee on Alcohol Legislation: Charles M. Woodruff, *Chairman*; Charles A. West and James F. Finnerman.

Committee on Anti-narcotic Legislation: John C. Wallace, *Chairman*; Fred K. Fernald and Eugene C. Brokmeyer.

Committee on Formulas and Labels: Harry B. Thompson, *Chairman*; C. Mahlon Kline and Charles M. Woodruff.

The following report of the Executive Committee was read and ordered received:

REPORT OF THE EXECUTIVE COMMITTEE.

Minutes of a meeting of the Executive Committee of the National Drug Trade Conference held in pursuance of a call of the President on the Municipal Pier in the City of Chicago at two o'clock P.M., August 13, 1918.

The meeting called to order by the President. Present: President James H. Beal, Secretary Charles M. Woodruff, Samuel C. Henry representing James F. Finneran, Dr. Burdick representing Dr. Wallace C. Abbott, Mr. George W. Lattimer, Dr. A. R. L. Dohme and Mr. Fred K. Fernald.

Dr. Dohme moved that the President call a meeting of the Conference at Washington or Baltimore at the earliest possible date in the interest of the creation of a Pharmaceutical Corps in the United States Army, the Conference to proceed in a body to present the matter to the proper authorities in Washington.

The motion was seconded by Mr. Henry, discussed, put to vote and carried.

The Secretary moved that the President appoint a committee of three to arrange for a meeting with the proper authorities and to formulate facts and arguments on the matter of a Pharmaceutical Corps in the United States Army for the consideration of the Conference.

The motion was seconded, put to vote and carried.

The President appointed as such committee: Dr. A. R. L. Dohme, Mr. Samuel C. Henry and Mr. Charles M. Woodruff.

Mr. George W. Lattimer moved that the committee just appointed suggest the date of the Conference meeting. Seconded and carried.

The Secretary then announced that the Conference had adopted the referendum submitted in Bulletin No. 6 and moved that the President appoint a committee of three to confer with the Postmaster General to see if he would not agree upon some measure to relieve the drug trade of the present inconvenience and injustice arising from inability to mail small packages of medicines containing therapeutic doses of poisonous substances.

The motion was seconded, put to vote and carried. Charles M. Woodruff, W. L. Crouse and Samuel L. Hilton, were appointed members of the committee.

Mr. George W. Lattimer moved that a committee of three be appointed to consist of the President, Dr. A. R. L. Dohme and one to be appointed by the President, to consider ways and means of broadening the scope of the Conference.

The motion was seconded and carried, and Mr. Lattimer was appointed the third member of the committee.

The Executive Committee then adjourned to meet again at the call of the President.

JAMES H. BEAL, *President*,

CHARLES M. WOODRUFF, *Secretary*.

The Secretary-Treasurer then gave an informal report respecting the state of the funds of the Conference, details to be incorporated in his regular report to be presented at the coming regular meeting of the Conference.

of which \$200.00 had been appropriated to forward proper efforts to secure executive or legislative relief respecting the mailing of medicinal preparations containing poisons in therapeutic doses.

The President then called for the report of the special committee appointed by the Executive Committee to arrange for a meeting with the Surgeon General of the Army and to formulate facts and arguments in favor of a Pharmacy Corps in the United States Army to present for the consideration of the Conference at a special meeting to be called by the President when such committee announced its readiness.

Dr. A. R. L. Dohme announced that he had arranged an appointment with Acting Surgeon General Richards for 11 o'clock Thursday, September 26, 1918, and that two members of the committee had prepared written statements covering their ideas of what the Conference should unanimously agree upon, and would present both, this being acceptable to Mr. Henry and himself. He then read his draft, and Mr. Woodruff, the other member of the committee, presented his draft.

Then followed considerable discussion, presentation of motions, etc., until it was finally voted that both drafts should be referred to a committee of five to include the original committee and President J. H. Beal and Mr. R. C. Stofer.

The matter of the amendments to the Harrison Act appearing in the War Revenue Bill (H. R. 12863) was brought up. Mr. Woodruff read a statement and petition he had prepared, moved that it be adopted as the sense of the Conference and copies sent to the members of the Finance Committee of the Senate, which motion was duly seconded.

Mr. Thompson read a presentation of the case he had prepared, whereupon Mr. Woodruff, with the consent of his second, amended his motion to include Mr. Thompson's paper, and to have 1000 copies printed, one copy to be sent to each member of the Senate and the others to be used now and in the future as occasion may warrant. The motion as so amended was carried unanimously and the special committee on narcotic legislation was instructed to look after the matter; also to arrange for a hearing before the Senate Finance Committee if possible. These papers having been printed as separate documents and duly distributed are not repeated in these minutes.

The Conference then took a recess until three o'clock.

AFTERNOON SESSION.

The Conference reconvened at three o'clock, P.M., all delegates being present.

The committee of five appointed at the forenoon session to harmonize the papers presented by the members of the special committee respecting a Pharmacy Corps in the Army, reported that they had agreed upon the following:

STATEMENT AND PETITION OF THE NATIONAL DRUG TRADE CONFERENCE
RESPECTING THE CREATION OF A PHARMACY CORPS IN THE
UNITED STATES ARMY.

To the HON. SURGEON GENERAL,
United States Army.

The following is respectfully submitted as the unanimous opinion of the delegates to the National Drug Trade Conference, a delegate body constituted and empowered according to the accompanying printed sheet, on the matter of the creation of a pharmacy corps in the United States Army.

The Conference recognizes the efficiency of the Medical Department of the Army as demonstrated in the present emergency. The United States has called into the service of the country a colossal army, such as our people have never before dreamed of, and the Medical Department of the Army has, with the self-sacrificing aid of the medical profession at large, met a call that might well have seemed preposterous, if coolly considered in a time of peace. Both in methods and care the world has never before experienced such thoroughness and effectiveness. The health of our forces at home and overseas has been conserved far beyond any expectancy based on past experience in our own land or others.

But the medical profession has not reached this praiseworthy result unaided. Pharmacy has done its share and should receive its recognition and just reward. If our field and base hospitals have been more abundantly and better equipped it is because of what pharmacy has done in the way of progress during the recent years. If medicine has wrought greater results during the present than in previous wars, it is very largely because pharmacy has furnished more effective material to work with. Our Army doctors to-day have serums, toxins, vaccines, antitoxins, those of former wars never heard of. Pharmacy has furnished products controlled by methods it has discovered since previous wars were waged. Pharmacy has provided better facilities and products for sanitation, for asepsis, for anesthesia, and for prophylactic and curative treatment than were known even to the Army physician in the Spanish-American conflict.

To-day the pharmacist is a man of skill, education and training; many are adept in chemical analysis and fully equipped for bacterial examinations. Like the physician, he has devoted time and money to qualify for the work of his vocation, which has now come to be recognized as quite as important, and certainly as exact a science as medicine itself and his services in the army are invaluable.

1. We believe the services of graduated skilled pharmacists should be made available to the men in our army at least to the same extent that they are made compulsory in civil life.

2. We believe this cannot be done to the best advantage to those serving, the service, or those served, without the establishment of a properly organized, officered and coördinated pharmaceutical service.

3. We believe that skilled pharmacists graduated from colleges recognized in the American Conference of Pharmaceutical Faculties, a national association of standing and repute among pharmacists and the public, are best able, under the general supervision of the Surgeon General, to organize and handle the service.

4. We believe that if the pharmaceutical service by which we mean the skillful compounding, examination as to quality and accuracy, keeping and storage, assembling, dispensing upon physician's prescription or order and if necessary, administering of all drugs and medicines supplied to the Army and taken by soldiers, were organized, executed and controlled by skilled pharmacists that that service would be greatly improved and that the chances for error and disaster following error would be materially lessened.

5. We believe that such a service can be best organized and perfected by the establishment of a pharmacy corps, analogous to the veterinary, dental and sanitary corps.

6. We hold that pharmacy should be recognized in our Army as it is in our civil life, where it is an essential feature, upon which the public health in no small degree depends; and because it was so recognized in our Revolutionary or Continental Army; and it is so recognized in the armies of both our allies and our enemies. The pharmacists of America are not recognized in the Army organization, notwithstanding their pharmacopoeia is made official by Federal and State action, and is regarded as the best in the world.

7. In substantiation of these, our averments and belief, we respectfully offer the following facts bearing upon the case in addition to those already in the possession of the Surgeon General as the result of the hearing held on March 19, 1918, before the committee on Military Affairs of the House of Representatives and to which we again respectfully invite his attention:

a. Most other nations have in their armies organized pharmaceutical corps and they would not have them if they were not convinced of their importance and desirability.

b. Our colleges of pharmacy offer courses of instruction that compare favorably with those of colleges of medicine and confer degrees upon those who successfully pass examinations in theory and practice of pharmacy; and such graduates compare favorably with the graduates of similar institutions where pharmacy is taught in all other countries and nations.

c. If in civil life the state and nation have seen fit to pass laws regulating pharmacy and pharmaceutical service as they have done for medicine and medical service, and if in civil life the men entering the service are entitled to receive this regulated and trained pharmaceutical service, no reason seems to exist why these same men should not be entitled to receive this same service as soldiers, notably when in the latter capacity their need for it is indisputably likely to be more urgent and more frequent.

d. Many prominent medical men of this country have expressed themselves as favorable to the establishment of such organized pharmaceutical service and as well their conviction that it would relieve the army medical service of much work which properly belongs to pharmacists.

e. Although ready manufactured medicines are necessarily largely used in the Army, still these medicines require the skill and knowledge of trained and experienced men to recognize them, identify them properly, keep and store them and examine them from time to time to know that they are of proper accuracy and strength.

It is therefore the unanimous opinion of the National Drug Trade Conference that pharmacy should receive due recognition in the United States Army that is now denied it; that pharmacists should be awarded suitable commissions with corresponding dignity and compensation, according to individual merit and services; that there should be a Pharmacy Corps as an integral part of the Medical Department, with well-defined functions, subordinate but not menial to the Medical Corps.

The Conference, however, will not assume to work out the plan of organization of such a corps, except in coöperation with those who have better knowledge of military affairs than the Conference professes to possess; but once the honorable Surgeon General announces his approval of the general proposition, this Conference, if requested so to do, will be glad to appoint a committee to work to the end we seek with any person or persons the Surgeon General may designate to represent him.

All of which is respectfully submitted,

JAMES H. BEAL,
R. C. STOFER,
A. R. L. DOHME,
SAMUEL C. HENRY,
CHARLES M. WOODRUFF,

Committee.

It was then voted that the report be adopted as the unanimous sense of the delegates to the National Drug Trade Conference on the matter of a Pharmacy Corps in the United States Army, and that the Committee be instructed to present it as such to the Acting Surgeon General of the Army at the interview to be had on the 26th of September 1918.

Mr. Thompson then broached the subject of the increasing difficulty experienced by manufacturers and dealers growing out of the great variation of the legal definitions and interpretations of the term "intoxicating beverages" under the prohibition laws of the various states, and the desirability of the Conference securing some understanding with the promoters of anti-

liquor laws as to a reasonable statutory definition that would not jeopardize those who necessarily handle alcoholic medicinal products, and that could be adopted by all the states.

The subject was discussed at great length by several delegates, and on motion made by Mr. Thompson, it was voted that the Committee on Alcohol take up the matter with the proper officers of the Anti-saloon League and see if a bill could not be drawn that would be agreeable to them and that would form the basis of a uniform bill upon the subject.

A discussion followed upon the features of the War Revenue Bill that were agreeable to the various interests represented in the Conference, but no formal action was taken.

At the suggestion of President Beal it was then voted to invite the National Association of Boards of Pharmacy, the American Conference of Pharmaceutical Faculties and the National Association of Food, Dairy and Drug Commissioners to become members of the Conference.

Mr. Samuel L. Hilton then informed the Conference of the dire straits certain colleges of pharmacy were in owing to war conditions and the failure of the War Department to provide for the training of pharmacists for army service as they had provided for other technical vocations. It was at first thought that the conference should take some action at this meeting; but finally considered that the American Conference of Pharmaceutical Faculties was more deeply interested in the matter, best qualified to pronounce upon it, and it was therefore voted that a committee of three be appointed to confer with the Executive Committee of the American Conference of Pharmaceutical Faculties, and after such conference to submit by referendum to the National Drug Trade Conference such preamble and resolutions as they desired the Conference to act upon.

The President appointed Mr. Samuel L. Hilton, Mr. John C. Wallace and Mr. Samuel C. Henry as such committee.

Mr. Samuel C. Henry then informed the Conference of certain action the National Association of Retail Druggists had taken respecting the request of the Public Health Service respecting the sale of remedies for venereal diseases. Mr. Samuel C. Hilton announced that the Council of the American Pharmaceutical Association had a similar request under consideration. It was considered that as the other associations would probably receive similar requests, and as no request had come direct to the Conference, no action on its part was called for.

It was then intimated that the Public Health Service was contemplating organizing a Division of Pharmacy, and the opinion was expressed that the Conference might do some constructive work in connection therewith. It was voted that a committee of three be appointed to investigate the subject and report to the Conference at its next meeting.

The President announced that the committee was an important one and he would take time to consider whom he would appoint.

There being no other business the Conference adjourned.

MEMORANDUM OF MEETING WITH SURGEON GENERAL *RE* PHARMACEUTICAL CORPS.

On Thursday, September 26, 1918, the Conference proceeded to Washington and interviewed Acting Surgeon General Richards upon the subject of a Pharmacy Corps in the Army. The members escorted into the presence of General Richards were President James H. Beal, Secretary Charles M. Woodruff, and Delegates Dr. A. R. L. Dohme, Samuel L. Hilton, Samuel C. Henry, John C. Wallace, James F. Finneran, Eugene C. Brokmeyer, George C. Hall, R. C. Stofer, Philip I. Heisler and Harry B. Thompson. Dr. A. R. L. Dohme, as chairman of the special committee, read the statement and petition adopted by the Conference and prefaced same by a few extemporaneous remarks; Dr. Beal followed with a few words introducing in turn Mr. Henry and Mr. Woodruff, and Mr. Brokmeyer concluded. The Acting Surgeon General and Col. Darnell, who was present, spoke very freely and frankly, expressing the determination of the Surgeon General's office not to create a Pharmacy Corps in the Army, giving their reasons in full detail. However, the delegates were all cordially received, and had nothing to complain of except that they did not get what they came for nor any encouragement that they ever would

THE RELATION BETWEEN CHEMICAL CONSTITUTION AND PHYSIOLOGICAL ACTION.

A lecture on above subject by Dr. F. L. Pyman, delivered before the Chemical Society, was reported in *Nature* and is summarized in the *Scientific American Supplement* of April 27, 1918; from this the following is abstracted: Doctor Pyman stresses the importance of the study of the relation between chemical constitution and physiological action of drugs. The first step in chemical investigation is the isolation of the principle to which the activity of the drug is due and then follows the determination of its constitution and the synthesis of a number of substances related to the parent compound, and comparison of their physiological action.

A discussion of "physiological action" is difficult because it involves any action on the living organism. It is impossible, for instance, to compare the bactericidal action of phenol with the hypnotic effect of diethyl-barbituric acid, or with the anesthetic action of cocaine; widely different causes may account for the same superficial signs of physiological action. Examples of physiological action are not wanting. Compounds of similar constitution generally possess a characteristic group-smell, while each member may have a specific odor. Sense of taste also provides an occasional means of discrimination not only between side-chains of different length, but also in certain cases between stereoisomerides.

Stereochemical influences often exercise profound effects, particularly on nerve-endings. Thus *l*-hyoscyamine has about a hundred times the mydriatic action of *d*-hyoscyamine, and *l*-adrenine many times the pressor effect of the dextro-compound. Asymmetry of a nitrogen atom may also condition a difference, as in the case of the α - and β -methochlorides of *l*-canadine. The cause of this variation still remains in doubt.

The influence of physical properties, such as solubility in different media, may be of im-

portance, and it has been shown that for a particular series of aliphatic compounds their narcotic effect on tadpoles was proportional to the partition-coefficients of their solubilities in oil and water.

As an indication of the effect of chemical properties, it has been shown that while certain basic dyes stain the grey nerve substance, their sulphonic acids do not. This difference suggested that bases, liberated in the blood-stream by alkalis, are extracted by the nerve substance, while their sulphonic acids remain in solution as alkali salts.

In the case of alkaloids it is a general rule that the introduction of a free carboxyl group profoundly modifies the physiological action. Benzoyl ecgonine, of which cocaine is the methyl ester, has no local anesthetic action; while quinine, obtained from quinine by oxidation of the vinyl group, is non-toxic. Formation of quaternary salts has also a considerable effect. For instance, papaverine has a strychnine-like action which is missing in its methochloride, and re-appears in its reduction product laudanose.

In the many cases in which members of a group of compounds of similar constitution resemble one another in physiological action it is of interest to observe the effect of slight chemical alterations. The following four pieces of work were then outlined: (1) *Tropeines* (acyl derivatives of the amino-alcohol tropine); (2) *aminoalkyl esters* (formed by the esterification of an acid with an alcohol containing an amino group); (3) *adrenine and the amines* (adrenine is the active principle of the suprarenal gland); (4) *protozoacidal drugs*. The results of experiments that have been made on the relative toxicity to infusoria of a number of cinchona derivatives, with a view to their employment in the treatment in malaria indicate that ethylhydrocupreine was the most active, but they do not admit of any certain conclusions as to the relation between their chemical constitution and protozoacidal action.

Experiments have also been made on the relative toxicity of the ipecacuanha alkaloids

to amoebae, and they indicate that the full amoebicidal action characteristic of emetine is exhibited only when the nucleus is intact.

QUININE AND UREA HYDROCHLORIDE.

Research work relating to preparations for administration and application of quinine and urea hydrochloride is suggested. The suggestion supplements others that have been made in the JOURNAL on a number of occasions, that coöperative research should be inaugurated in schools of pharmacy and medicine. The interdependence of medicine and pharmacy should be more thoroughly realized and action accordingly will develop the efficiency of a service to which the public is entitled from these professions. The advancement of medicine depends on the progress of pharmacy and the latter is made possible by such co-operation. It seems to us that a hearty, intense "working-together" will not only redound to the advantage of both and for the benefit of those served, but that this is the only rational plan and presents a duty. There is so much said of pharmacy as a small part of the drug business, as insignificant in the Army Medical Department, when really the fault is not with pharmacists but because the services of pharmacy are not fully utilized. It is high time that selfish motives be put aside and altruism, which the professions claim to be possessed of, brought into evidence by action. We are pleased to note the following statement in an editorial of the *Missouri State Medical Journal* for July: " * * * However the cry for still greater efficiency in the Medical Department of the Army gives promise that ere long a corps of professionally trained pharmacists will be placed under the command of Surgeon General Gorgas." But this is digressing from the purpose of this writing.

Research in connection with quinine and urea hydrochloride is not more important than that of many other chemicals which require investigations in the pharmacy and in the clinical laboratories. Last fall several articles appeared in the *Journal of the A. M. A.*, one by Dr. Joseph F. Saphir, in the issue of December 22, 1917, and another by Dr. E. H. Terrell in that of November 3, 1917, dealing with the drug as an ideal local anesthetic for rectal operations. Prof. Roberts Bartholow employed the salt as a local anesthetic many years ago; reports thereon by

Dr. Solomon Solis Cohen appeared in the *Philadelphia Polyclinic* in 1884. The latter contributed an article on "How to Use Quinine and Urea Hydrochloride, Especially for Systemic Effect by Injection in Malaria and Pneumonia," to the *New York Medical Times*, March 1912.

Professor Cohen employs the salt in applications for tonsillitis, 1 : 10, or stronger solutions, and it was in correspondence with him relative to perfecting a prescription for such a gargle that our attention was again directed to this useful drug. Aside from the references already given those that follow may be helpful, as they include further citations:

1. Observations on the Hypodermic Use of Quinine and Urea Hydrochloride in the Diagnosis and Treatment of Acute and Chronic Malarial Infections. And on the Resemblance to the Sexual Cycle of the Hemamoeba Manifested by the Periods of Freedom from Paroxysms that Ordinarily Follow a Single Injection of about One Gramme of this Salt. PHARMACISTS SHOULD HAVE THE CREDIT FOR PERFECTING FORMULA OF NEUTRALIZING OINTMENT.

Dr. H. V. Army, in a letter to the *American Druggist*, calls attention to an article in the daily press wherein credit is given to chemists for developing the formula for the neutralizing ointment for the poisonous effect of mustard gas. The chemical corps worked out the antidotes, but when the work reached the ointment stage they turned that over to the *pharmacists*. New York College of Pharmacy

"loaned" one of Doctor Army's staff to the Government, who solved that phase of the problem.

No desire is expressed to take away credit from the chemists, but the work of pharmacists is so seldom credited to them that it pleases us to quote Doctor Army, though unfortunately this will not receive the wide publicity given the article in the press.

THE LEAST THAT SOME OF US CAN DO.

Secretary H. M. Whelpley, of the Missouri Pharmaceutical Association, under above caption brings a message to pharmacists. He says that many pharmacists have gone in to participate in our country's cause, others will go, and most of them lose their identity as pharmacists, but we should not forget the fraternal spirit. Every member knows some one who has enlisted, cheery messages will do a great deal toward keeping them in touch with pharmacy. True, they are over there to battle for their country; still, they will return, and they should not have cause to say that the tie that binds snapped when they left their homes.

And this brings up the resolutions by Mr. Freericks, which contemplated that provision be made for the pharmacists after they return. The time to prepare is now, these soldiers are entitled to our consideration.

KEEP UP ADVERTISING—A MESSAGE TO THE MANUFACTURER.

If one looks over the British pharmaceutical journals one sees that there is just as much or more advertising being done by British manufacturers now as before the war. The large semi-annual numbers have not been issued, but aside from these there is now just as much advertising. The American manufacturers should take a lesson, many have kept up their publicity, but a like number have not.

Val Fisher, a London publisher, in an address in New York City recently, said:

"Some wonderful things have happened in advertising, through war conditions, and I want to touch on some of those things, that you may be prepared for the conditions that will probably arise as the war goes on. In the last four years the business men of Great Britain have learned more concerning the importance of building good-will through advertising than they did in forty years preceding the war.

"In considering business conditions in England you must bear in mind that one-half of

all the men in England between the ages of 18 and 51 are in military or naval service. That means one-third of our entire male population, from infants in the cradle to the extremely old.

"You must bear in mind that 5,000,000 British women who never worked before have voluntarily gone to work to fill the places of men at the front. Hundreds of our women are working in factories making TNT—a work that ruins the hair and turns the skin yellow—thus sacrificing their beauty for the rest of their lives for the sake of Britain and freedom. We have only one business in England and that is to win the war. We are all concentrated on that one thing, even to the boys and girls.

"You would think under such conditions, with as many men in active service, in proportion to population, as you would have if you had 18,000,000 men in uniform—you would think under such conditions that retail business would be bound to be bad. And yet business is wonderfully good. You American business men are now in much the same position as were the British business men at the end of their first year of war. You are wondering what will be the effect of increasing selective service—you are anticipating restrictions on your business—and I want to tell you some of our experiences so you can profit by them.

"The department stores of any country usually reflect the state of trade. The profits of the twelve leading department stores during the period of the war were as follows: Fiscal year 1914-15, profits \$4,950,000; 1915-16, \$4,250,000; 1916-17, \$5,575,000. In the Provinces the profits of the nine leading stores were: 1914-15, \$750,000; 1915-16, \$945,000; 1916-17, \$1,150,000.

"From the outbreak of the war British business men clearly recognized their duty to their country and its fighting men. It was essential that they should strain every nerve to keep the trade of the country as near normal as possible during the war, and it is just as essential that when peace comes they must be prepared to keep every factory working at full pressure and to find employment for every employable unit. It is only by such methods that Britain can pay for her share of the war.

"No nation stands to gain as much commercially from the war as does America. In Great Britain the per capita income is \$236, and the per capita debt \$589; in the United States your

per capita income is \$352, and your per capita debt is \$63.

"These are times of rapid and tremendous change. No man can rest on his laurels. Those who were leaders last year, those who are leaders now in their respective business lines, may be surpassed next year by far-seeing efficient and thoroughly prepared competitors who have laid their plans a long way in advance."

RANK FOR ARMY NURSES.

To make a force of nurses effective it must be organized under those having authority to command them. Privates in the medical corps, called orderlies, but with little professional training, must help the nurses in their duties. Tasks requiring physical strength and no skill must be done by them and the nurses must tell them how and when.

In an army rank counts much in enforcing orders and discipline, and organization is impossible without it. Therefore army-trained nurses should be given rank, non-commissioned and commissioned, as it is given in all other branches of the Army. The fact that nurses are women is no reason for withholding it. It is given in the British army and works well. Why not in ours? There are many uniformed men in the Army with commissions who will never be exposed to as much danger and who are no more necessary in the military establishment.

Why there should be opposition it is hard to say, unless it be the same narrow view held somewhere in the medical corps of the Army which resisted the employment of female trained nurses at all.—William Howard Taft, in the *Philadelphia Public Ledger*.

Ex-President Taft's plea for the nurses is unanswerable. The Army nurses should have rank to do their best work, as should pharmacists also. Why those in authority so persistently refuse to see the light can be explained only on the ground of wilful prejudice.

There is a point that should be emphasized, the present method of drug administration will produce a large number of dispensing doctors, after the war. It is just as well to realize this. Will it benefit or injure the medical practice? We are inclined to say that it will be hurtful to both pharmacy and medicine. It will not only produce office dispensers but apothecary-physicians. Neither class will help the progress of medicine and pharmacy. The prescribing and dispensing of medicines are different and

not interchangeable functions. Both medical men and pharmacists are concerned in the recognition of pharmacy as a profession. Is it because the former have received such splendid recognition that they are unmindful now of the conditions after the war?

THE NEW SURGEON GENERAL, U. S. ARMY.

Merritte W. Ireland, Chief Surgeon of the American Expeditionary Forces in France, succeeded William C. Gorgas as Surgeon-General of the U. S. Army October 4. The latter was retired for age, and appointed medical

Copyright by Harris & Ewing

MERRITTE W. IRELAND.

representative of the United States in the Supreme War Council at Versailles. General Robert E. Noble succeeds Major General Ireland in France.

While we differ from Surgeon General Gorgas in the estimate of pharmacy, we recognize his ability and honesty, and his success as a sanitarian and also in the handling of his stu-

pendous task; he has gained the general respect and he holds the confidence of pharmacists, notwithstanding their differences of opinion. His accomplishments have benefitted humanity, the record has become part of history. May the years still spared to him be full of health as they will be of honor.

Whether Surgeon General Ireland will hold different views relative to pharmacy from his predecessor remains to be seen. He went to France with General Pershing and had the opportunity of becoming acquainted with the Departments of the French Army. He is largely responsible for the medical organization and hospital facilities of the American Expeditionary Forces. Before the war he was assistant to preceding Surgeon Generals and is therefore well acquainted with the office he has assumed. The knowledge of conditions in France is most valuable. The Medical Corps has thus far not followed the practice of other branches of the Service in sending back regularly officers who have served in France so that they might instruct those on this side of the water and give them the right perspective of the war, and it is likely such plan will now be followed with the Medical Corps.

Surgeon General Ireland is fifty-one years of age, a graduate of Detroit College of Medicine and Jefferson Medical College. He has been in the Service practically since his graduation, served in Cuba and the Philippines, and was for a time stationed at Fort Sam Houston, Texas, under General Pershing. His is an active, vigorous personality, and he has a knack for executive work.

James H. Beal, ex-President of the American Pharmaceutical Association and first editor of the *JOURNAL A. PH. A.*, has been appointed a member of the Advisory Board on Medicinal Products to the Medical Section of the War Industries Board.

Harry B. Mason, for many years editor of the *Bulletin of Pharmacy*, has resigned this position to accept that of director of promotion, publicity and advertising for Parke, Davis & Co.

Prof. Joseph P. Remington saw the completion of the sixth edition of Remington's *Practice of Pharmacy*; Prof. E. Fullerton Cook assisted in several prior revisions and his name is on the title page of the last; Prof. Charles H. LaWall has now also been selected as one of the editors. The future editions of this standard will be taken care of by the editors who studied under and were associated with Professor Remington, and whose work will be carried on by them and revised as progress demands. Both of the editors are well known to pharmacists and their selection for this work was almost a foregone conclusion.

RAINEY BILL PASSED BY THE HOUSE.

The Rainey Narcotic Law passed the House October 2. The vote was unanimous.

SENATE COMMITTEE AGREES TO LOWER TAX ON DISTILLED SPIRITS.

In the consideration of the War Revenue Measure a tax of \$6.40 per gallon instead of \$8.00, was agreed to by the Senate Finance Committee, on distilled spirits for beverage purposes.

SOCIETIES AND COLLEGES.

MATCH LUZERNE COUNTY.

The Luzerne County Branch of the American Pharmaceutical Association is the name adopted by the pharmacists of Wilkes-Barre and vicinity for this new organization. Their success shows what may be done in organizing branches elsewhere. Up to date Luzerne County Branch A. Ph. A., has 51 members, and the enthusiasts say they will have 100 soon.

One of the first real accomplishments in the way of business was to fix the hours for drug stores, in this prosperous valley, from 9 A.M. to 9 P.M. That alone was worth many times the price of organization; the cooperation, friendship and monthly meetings will multiply the benefits to be derived therefrom. This is

a call for no less than one hundred other counties to "match Luzerne."

The officers of the Branch are: *President*, Walter Banker; *First Vice-President*, W. D. White; *Second Vice-President*, James F. Kane; *Treasurer*, E. R. Owens; *Secretary*, Joseph D. Morgan.

The Second Vice-President is from Pittston, the other officers reside in Wilkes-Barre.

THE TWENTIETH ANNUAL MEETING OF THE NATIONAL ASSOCIATION OF RETAIL DRUGGISTS.

The Twentieth Annual Meeting of the National Association of Retail Druggists was held in New Orleans September 16-20. As expected, the attendance was not as large as in

other years, but the interest of the members was centered on the Convention and much business was transacted.

The address of President W. H. Cousins gave a general review of the activities of the Association and urged the continued coöperation of the Association with the Government, with legislative committees, and a more intensive interest in matters of legislation pertaining to the drug business. He spoke for recognition of pharmacists by the Government.

Secretary Samuel C. Henry reported the addition of 1,236 members during the year. He explained the new conditions brought about by legislative enactments, and the increased work of the Organization Department.

Treasurer Grant W. Stevens reported a surplus in the treasury of \$37,198.80.

Among the recommendations of the Executive Committee were the following:

That the Association oppose all proposals which seek to consolidate Pharmacy Boards with other Boards or Commissions.

CHARLES F. HARDING, Cincinnati, Ohio,
President N. A. R. D.

That the Rainey Amendment to the Narcotic Law be defeated.

That the Edmonds Bill be supported.

That deferred classification be made for pharmaceutical students, so that they may continue their studies and that the public be not deprived of pharmaceutical service.

Cooperation with all branches of the Gov-

ernment in its prosecution of the war was pledged.

Because persons have been permitted to become registered pharmacists, both by examination and otherwise, without first becoming citizens of the United States, and these individuals are not amenable to the Draft Regulations and may continue in business to the detriment of citizens who are constantly being called from their business to the colors, which in effect accords special privileges by state laws to persons not citizens when such privileges are denied citizens, therefore the N. A. R. D. went on record as opposed to the registration of all persons as pharmacists who are not citizens of these United States or who have not at least taken out first papers certifying their intention of becoming citizens.

The U. S. P. and N. F. Propaganda Committee reported a busy year. It is contemplated that representation be secured for the Association on the U. S. P. Revision Committee. It was recommended that fluidextracts be replaced in the Pharmacopocia, in whole or part, by 50 percent tinctures, "or by some other representative class of medicine."

Among other resolutions adopted were the following:

Against compulsory health insurance laws.

For an American Materia Medica, as far as this is possible.

For proper modification of the Patent and Trade Mark Laws.

The members were urged to subscribe to the following pledge and to lend their efforts in combating of venereal diseases:

PLEDGE.

We, the undersigned druggists, appreciate the seriousness of venereal diseases, especially among the armed forces of the United States as indicated by the reports of the Surgeon General of United States Army, and we hereby pledge ourselves individually to coöperate with the United States Public Health Service and with all health authorities to do all that lies within our power as druggists to aid in reducing the venereal scourge among civilians, and specifically do we agree:

1. Not to prescribe or recommend any remedy for a venereal disease.

2. Not after this date to purchase a "proprietary remedy" for a venereal disease, and not to sell such "remedy" after Dec. 1, 1918.

3. To cause to be handed to every person asking for a remedy which we believe is to be used for a venereal disease without a physician's prescription, a card or other literature furnished us by the Surgeon General, directing such applicant to a reputable physician, to a board of health, or to an approved venereal clinic.

4. Not to refill prescriptions for the treatment of venereal diseases without the order of a physician.

It is understood the Government will require the physicians to sign the following pledge:

1. To keep accurate record of all venereal patients treated in accordance with State laws, and to report same to the proper health authorities required by the State, County or City.

2. To indicate where required on such individual record when the patient is discharged as cured and in such cases which fail to continue treatment to the point of cure, to report same to the Board of Health or competent authority.

3. To comply with the request of the Surgeon General, neither to compound or dispense remedial agents for venereal disease except in emergency conditions, and in such event to make complete notation of ingredients used and quantities of each on each occasion so dispensed.

4. Except in cases requiring special treatment to follow the method of treatment as laid down in the instructions and procedure outlined by the Surgeon General for cases of this character.

It was also resolved that the N. A. R. D. in convention assembled, petition our Federal, State and Municipal Governments to establish venereal clinics in various easily accessible zones where proper modern treatment of said diseases may be assured.

The entertainments of the meeting were successful in every way. Fortunately the business of the meeting was so arranged that all of Friday of the week was given over to the entertainments.

A pleasing event of the Convention was the election of Dr. Wm. C. Anderson, Wilhelm Bodemann, John W. Lowe and Simon N. Jónes as life members of the Association.

The following were elected officers for the ensuing year: *President*, Charles F. Harding, of Ohio; *First Vice-President*, W. A. Oren, of Indiana; *Second Vice-President*, Harry B. May-

er, of Tennessee; *Third Vice-President*, A. Wirth, of Louisiana; *Secretary*, Samuel C. Henry, of Chicago; *Treasurer*, Grant W. Stevens, of Michigan.

Executive Committee: *Three years*, Charles H. Huhn, of Minnesota; Walter H. Cousins, of Texas. *Two years*, James F. Finneran, of Massachusetts; Robert J. Frick, of Kentucky. *One year*, James P. Crowley, of Illinois; Theodore F. Hagenow, of Missouri.

FORTY-FOURTH ANNUAL MEETING OF THE NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION.

The forty-fourth annual meeting of the National Wholesale Druggists' Association convened during the week of October 7, in Hotel Astor, New York City. Notwithstanding the many things that interfered, general satisfaction was expressed because of the number present, and the meeting proved an interesting and profitable one. President Charles E. Bedwell, of Omaha, presided over the meetings. Loyalty was expressed in all transactions wherein the question entered; among the speakers were J. T. Allen, associated with the Y. M. C. A. overseas work, and at the banquet Hon. Martin Littleton and Dr. Royal S. Copeland, New York City Health Supervisor, who spoke also of the splendid coöperation from the drug industries in fighting the prevailing epidemic.

A. L. Everett, counsel N. W. D. A., declared that the Association had violated no law of the United States as alleged by the Federal Trade Commission, and characterized the publicity given to the charges of the Commission as shameful to a sincerely patriotic and honorable industry and that only the opportunity was lacking for the Association's officials to appear and show their innocence of the charges brought against them.

The report of Chairman R. R. Ellis, of the Trade Acceptance Committee, was most interesting and the plan of putting the system into effect is being perfected. While there will be some objection for a time, the establishment of it will bring about healthier business conditions.

The report of the Legislative Committee was important. While realizing that tremendous sums of money must be raised to carry on the war and to pay bills already contracted, even if the war should end soon, the wholesalers fear that the tax measure now proposed may prove so drastic in its charges that there

will be no business done on which the tax can be levied and collected. According to many members who spoke briefly after the committee had announced its report, a more reasonable basis for taxes will still allow a large volume of business to be done on which the net gain to the Government will be a great deal more than would a big tax on a small volume of business.

The matter will be taken up with the Senate Finance Committee and an effort made to arrange a compromise of some sort on drug taxes. It is feared by the wholesalers that if the bill goes through as now drawn, retailers will stop handling many proprietary and patent preparations on which the profit is already limited.

There was great interest in the salesmen's contest over papers on "Economic Value of the Wholesale Druggist and Reasons Why He Is Essential." The judges, Messrs. Walter V. Smith, Frank H. Garrett and J. K. Lilly, had considerable of a task, a duty they conscientiously performed, many papers being entered in the contest for which the prizes amounted to \$500.00.

New Orleans was chosen for the next place of meeting and Arthur D. Parker, of the host-

city, was elected president. Other officers chosen were *First Vice-President*, Joseph Plaut, New York; *Second Vice-President*, William J. Murray, Jr., Columbia, South Carolina; *Third Vice-President*, W. F. Cram, Des Moines; *Fourth Vice-President*, R. W. Blanding, Providence; *Fifth Vice-President*, Fred E. Yahr, Milwaukee. The Board of Control for next year consists of *Chairman*, George R. Merrill, St. Louis; L. D. Sale, Los Angeles; F. C. Groover, Jacksonville; H. D. Faxon, Kansas City; Lee M. Hutchins, Grand Rapids; R. R. Ellis, Memphis; W. T. Harper, Ottumwa, Iowa; G. Barrett Moxley, Indianapolis; S. D. Andrews, Minneapolis; B. A. Jackson, Providence; W. E. Greiner, Dallas.

The Board of Control, at its organization meeting, reappointed F. E. Holliday as *Secretary* and C. H. Waterbury as *Assistant Secretary*.

Among the entertainment features were the President's Reception, a banquet, and a trip up the beautiful and busy Hudson. McKesson & Robbins issued *Drug Topics* as a souvenir booklet, containing the program, historical and local matter, and pictures of many members of the Association.

OBITUARY.

John Augustus Dunn, chemist for E. R. Squibb & Sons since 1866 and superintendent of the firm for about thirty years, died at his home, Brooklyn, N. Y., Friday, August 30. Mr. Dunn was a regular attendant at the annual meetings of the American Pharmaceutical Association until 1910. For the following data we are indebted to Mrs. Dunn.

Mr. Dunn was born in 1840 in St. Louis, Mo., and was from his early boyhood the constant companion of his dear friend, Dr. William F. Edgar, of Los Angeles, Cal. Dr. Edgar was U. S. Army Surgeon and before the Civil War was with the U. S. Government Scientific Survey. The deceased, then a boy, traveled with the expedition that was detailed to run the 35th parallel through New Mexico and to establish a U. S. Post at Albuquerque. These were the first white people who had ever penetrated that country. It was during this expedition that scientists first observed the land of the Cliff Dwellers and claimed that the peculiar formation was due to volcanic disturbance, while the men in the command looked on and argued "These things were made by human hands," which we all know was proven later. Wonderful and numerous were the tales

JOHN A. DUNN

this interesting old gentleman related of the primitive American Indian. As he always added "Still untainted by the inroads of Civilization." It was during this expedition that the Government imported camels to accompany the command across the American desert. The journey was hard and strange and the men impatient and often angry. Mr. Dunn has often told how much he was impressed when early one Sunday morning they espied the green country beyond the Sierras and the great Pacific in the distance. Not one word was spoken, but every single man fell upon his knees and prayed his thanks to the One who had safely brought them out of that alkali waste. They went on to California and were stationed at the Presidio and for a time at San Diego.

When the Civil War broke out Mr. Dunn came to New York with the troops and was in the Government employ as an apothecary. In 1866 he entered the employ of E. R. Squibb & Sons, Manufacturing Chemists, as superintendent and as such held sway until in the latter nineties he became one of the firm. He was an expert and an authority in his line.

About ten years ago his eye sight failed, but he did not give up active work until 5 or 6 years ago. He was up and around as usual the day before he died of a stroke, Thursday, August 29, from the effects of which he passed away Friday morning. Deceased was a graduate of the New York College of Pharmacy. He joined the American Pharmaceutical Association in 1867, always attending the conventions until 1910. He participated in the discussions and imparted much information from his well stored mind. In 1910 he was elected Secretary of the Historical Section.

Mr. Dunn was buried in the Cemetery of Holy Cross, Flatbush, on Monday, September 2. He leaves a widow, Annie E. and a daughter, Mrs. J. O. Reither, of Lynbrook, Long Island.

FREDERICK MICHAEL SCHMIDT.

Fred. M. Schmidt was born in Chicago, Ill., June 6, 1859, the son of Dr. Ernst Schmidt. Wilhelm Bodemann writes that the latter introduced him to the doctors of the Southside when he opened his store at the corner of Harrison and State in the vicinity of where Doctor Schmidt, the father, then resided, and thus began his friendship with the deceased. Mr. Schmidt was president of the Chicago Veteran Druggists' Association and presided at the Round Table September 26, two days prior to

his death. Contemplating a trip East, he bade his friends farewell after the weekly luncheon. His health had not been good for several years, but during his term of office he was a regular attendant at the luncheons.

Mr. Schmidt attended the Chicago College of Pharmacy and was secretary of the institution for several years after he graduated. He spent the years of 1865, '66 and '84 in Germany in completing his education and travel. As clerk he was employed with John W. Ehrman, Victor Erich, Otto Peuser and E. H. Sargent. In 1881 he opened a drug store on

FREDERICK MICHAEL SCHMIDT.

the second floor of the building at the northwest corner of Madison Street and Fifth Ave., and was the first one to open a pharmacy above street floor. In 1886 he became associated with O. F. Fischer, purchasing the E. H. Sargent Prescription Pharmacy; the latter later purchased the Wabash avenue store and Mr. Schmidt the one at 78 State Street, which he moved first to the Schiller building and afterward to the Mallers building.

Mr. Schmidt was member (1894-1898) and president (1898) of the Illinois Board of Pharmacy and of the Illinois Pharmaceutical Association (president 1899-1900).

In 1895 Mr. Schmidt married Miss Clara Louise Rehm, who, with a daughter and son, survive. The deceased joined the American Pharmaceutical Association in 1887.

C. V. D. A. MEMORIAL MEETING, OCTOBER 3, 1918.

After finishing routine business, October 3,

the Chicago Veteran Druggists' Association went into a memorial service for our President, F. M. Schmidt, who only a week previous presided as usual. His chair, tipped over, was draped in mourning and a red carnation pinned to the crepe—and this will so continue during October. Vice-President Frank Schrage assumed the Presidency, and at his request all members arose from their seats in silent prayer and reverence, and after short addresses were made by those who had known him best, *viz.*, G. P. Engelhard, O. G. Hottinger, E. von Hermann, W. K. Forsyth and W. Bodemann.

It was pointed out that his failing health for the last few years had made him rather an infrequent attendant at our meetings, but since he was elected to the Vice-Presidency, and subsequently Presidency—he was very seldom absent; it seemed as if the C. V. D. A. spirit had given him a new lease of life.

At the funeral five schoolday friends and Secretary Wilhelm Bodemann acted as pallbearers, and as they carried the coffin to the hearse the members of the C. V. D. A. formed a line, and dropped their one carnation on the coffin as a last tribute of our love and friendship and respect for the departed President.

(Sgd.) W. BODEMANN,

Recording Secretary, C. V. D. A.

George Kleinau, member of the American Pharmaceutical Association since 1911 and one of the best known and most active members of the New York German Apothecaries' Society, died at his home in New York on August 20, at the age of fifty-one. Mr. Kleinau was taken ill with Bright's disease in the spring, and retired from business on the advice of his physician, selling his store on Park avenue. He joined the New York German Apothecaries' Society in 1896 and was a staunch and active member up to the time of his death. He was for many years chairman of the committee on trade interests and took an active part in molding legislation in connection with pharmacy.

Sergeant Joyce Kilmer, son of F. B. Kilmer, member of the American Pharmaceutical Association, gave his life to his country in the performance of his duty in France, July 31, 1918.

H. C. Cousins, father of ex-President W. H. Cousins, of the National Association of Retail Druggists, passed away at his home at Wei-

ner, Texas, at 6 o'clock, p.m., Tuesday, September 24th, aged sixty-six years. Mr. Cousins was a pioneer of Texas, having come to the state nearly fifty years ago. Mr. Cousins is survived by his wife and seven children: W. H. Cousins, of Dallas, Texas; Mrs. J. R. Mitchell, of Weinert, Texas; A. J. Cousins, of Haskell, Oklahoma; Mrs. Bessie Gregory, of Los Angeles, California; H. H. Cousins, of Shreveport, La.; Mrs. Ben Bridges, of Ft. Worth, Texas, and Mrs. J. Milam Diggs, of Munday, Texas. He was laid to rest in the little cemetery adjoining the ranch where he had spent many years.

JOHN CHARLES GALLAGHER

John C. Gallagher, one of the oldest druggists of Jersey City, N. J., died October 2; he had been in poor health for several years. Mr. Gallagher was deeply interested in Association work and was president of New Jersey Pharmaceutical Association, 1914-1915, and a

JOHN C. GALLAGHER.
Jersey City, N. J.

member of the Legislative Committee for a number of years. He was elected a life member of the State Association in 1899, and joined the American Pharmaceutical Association in 1893.

We hope to make further mention of the deceased in the next issue of the JOURNAL.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGE OF ADDRESSES SINCE JULY 5, 1918.

U. S. PUBLIC HEALTH SERVICE.

List of changes of duties and stations of commissioned and other officers of the United States Public Health Service for the period ended October 2, 1918.

Phar. Charles L. Schultz. Proceed to Stapleton, N. Y., for duty and assignment of quarters. Aug. 14, 1918.

Tech. Asst. A. Seidel. Proceed to Cambridge, Mass., to assist in work on pharmacology. Aug. 16, 1918.

Bacteriologist Clifford Pfau. Proceed to Newport News, Va., on special temporary duty. Aug. 15, 1918.

Asst. Chem. K. K. Marcus. Proceed to New York, N. Y., for the purpose of conducting certain tests on workers in explosive factories. Aug. 19, 1918.

Phar. J. A. Wolfe. Relieved at the Bureau. Proceed to the Marine Hospital, Pittsburgh, Pa. Aug. 29, 1918.

Spec. Investigator C. W. Metz. Transfer investigations of malaria to Lakeland, Fla. Aug. 30, 1918.

Scientific Asst. C. A. Abele. Relieved at Anniston, Ala. Proceed to Jackson, Miss., for duty. Aug. 29, 1918.

Scientific Asst. A. F. Allen. Proceed to Jackson, Miss., for conference with Scientific Asst. Abele. Aug. 29, 1918.

Scientific Asst. M. Carr. Proceed to Pittsburgh, Pa., for duty in connection with field investigations of industrial sanitation. Aug. 28, 1918.

Scientific Asst. Sam'l Sanders. Relieved at Macon, Ga. Proceed to Brunswick, Ga., to assume charge of sanitary district. Aug. 29, 1918.

Phar. E. S. Maguire. Relieved at Detroit, Mich. Proceed to Tampa Bay Quarantine Station. Sept. 7, 1918.

Phar. C. R. Ott. Relieved at Louisville, Ky. Proceed to the Marine Hospital, Detroit, Mich. Sept. 7, 1918.

Consulting Hygienist Otto P. Geier. Proceed to Cincinnati, O., by way of Nitro, W. Va., and assume supervision over sanitary matters in connection with the construction and operation of a Government nitrate plant near Cincinnati. Sept. 7, 1918.

Phar. C. H. Bierman. Proceed to the Boston Quarantine Station for temporary duty. Sept. 19, 1918.

Asst. Educational Director Paul B. Johnson. Proceed to Philadelphia to present the Government program for venereal disease control to the Pennsylvania State Medical Association. Sept. 27, 1918.

Asst. Educational Director Walter W. May. Proceed to New York City in connection with the operations of the industrial program for the control of venereal diseases. Sept. 30, 1918.

Asst. Educational Director Caroline Rosenberg. Proceed to Baltimore, Md., for conference with chairman of executive committee of Association of Railway Surgeons relative to measure for the control of venereal diseases. Sept. 26, 1918.

JOHN MCKESSON, JR.

NEW YORK, N. Y.

In the drug business for sixty-two years. Member of the American Pharmaceutical Association
for fifty-one years.

JOHN MCKESSON, JR.

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

NOVEMBER, 1918

NO. 11

JOHN McKESSON, JR.

Few Americans now living have had a longer, more intimate, more active and more virile an influence on any industry of the United States than has John McKesson, Jr., President of McKesson & Robbins, Inc., on the drug industry.

It is doubtful if any man in America has a wider knowledge of drugs and chemicals, of their sources of supply, the quantities of them annually produced, who controls them and how to get them.

Counting his apprenticeship in the house of McKesson & Robbins, of which his father was one of the founders this is John McKesson, Jr.'s 63rd year in the wholesale drug business of America. At 78 years of age his hand is still at the wheel—the master hand of a great institution—strong, alert and skillful seemingly as it has ever been.

Methodically as the ebb and flow of the tide, unconscious of growing years, with a zest for the day's work ahead of him that many a younger man might envy, he is at his desk each day at the stroke of the clock. A gentleman of the old school, disdaining ease, inured to hard work, you'll find him there in rain or shine in his little private office, answering cables from all parts of the world, directing replies to important mail, giving instructions over the telephone and advice and counsel to his subordinates, his sensitive fingers every second of the day on the world's drug and chemical pulse. With agents in every section of the globe, where drugs and chemicals abound, that little room for more than half a century has been within an hour's touch of all the world.

When on that fateful day in August 1914 word flashed into that room from Europe that the torch of war had been lighted in the world's greatest source of drugs and chemicals, there flashed back, quick as lightning, a message that to thousands of retailers, physicians and hospitals in America was vital. That message flashed across the Atlantic and Pacific in the most critical hour the American drug and chemical industry has ever known, sent hundreds of tons of crude drugs and chemicals to this country from every point of the compass. His foresight and initiative in this situation helped to ease a situation pregnant with

serious possibilities. What he did for the trade in 1914, he did in 1916 and 1917 for the Government, and when it called it found him ready with the materials it needed. Profiting by his experiences in the Civil and Spanish wars, he knew what Uncle Sam needed and anticipated it.

For 50 years John McKesson, Jr. has aggressively pushed and sought to popularize high grade American drugs in Europe, especially American botanicals, and has done much to extend their use. He was one of the first wholesalers in the United States to enter the pharmaceutical manufacturing field, and to make the whole world his market by engaging in an international business. In China he introduced packaged drugs with Chinese labels on them and in Central and South America with Spanish labels. The Governments of France, Italy, Russia, Greece and other nations of the old world have been his customers. He ships to Iceland and Cape Town; from New Zealand to Greenland and all the points between. His representatives cover the earth.

Once a year for many years Mr. McKesson himself has visited all the leading markets of Europe to study conditions at first hand. He knew the drug markets of the world by personal contact; whenever he moved—he knew accurately what could be done. From the first he has worked to give to American drugs, wherever sold, a tone of the highest quality. Quality has been his touchstone for 50 years. For it he has fought and made many sacrifices.

Starting with one building in 1833, the institution, of which he is the head, under his leadership has grown into seven buildings, covering many acres of floor space and employing help now counted in the four figures. Under him and that of his energetic partner the late Daniel C. Robbins, many men now well known in the trade received their training and got their start, including Henry S. Wellcome of Burroughs, Wellcome & Co., Samuel W. Fairchild of Fairchild Bros. & Foster, George R. Millier of George R. Millier & Sons, Harry Hall of Hall & Ruckel, Joseph F. Glatz of Schering & Glatz, Chas. F. Ward of Ward, Close & Co., Charles McLaughlin of McLaughlin, Gormley King Co., George Hartford, and a long list of others.

Mr. McKesson joined the American Pharmaceutical Association in 1867.

E. G. E.

INDUSTRIAL ORGANIZATIONS.

General Charles Dick, a former Senator from Ohio writing in the *New York Commercial*, says:

"The era of compelled industrial competition will give to a better era of wisely controlled combinations. For thirty years it has been the fixed policy of the Government to prevent combination whenever it tended to restraint of trade, and to enforce competition. There was no distinction recognized between good combinations and bad combinations.

"The people, however, have seen a new light. The Supreme Court of the United States has discovered some good combinations, some of them so good, the court declared, it would be most unfortunate if such an efficient industrial organization should be destroyed. When the United States was forced by the necessity of war to take charge of industry and called on big business to fill war orders, it made no attempt to enforce competition. On the other hand, it encouraged combination, coordination and collaboration with a resulting increased efficiency in product and increase of output. It is inconceivable that we shall ever return to the unrestrained competition which once prevailed."

EDITORIAL

E. G. EBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

PHARMACY ACKNOWLEDGED AN "ESSENTIAL SPECIALTY" OF ARMY MEDICAL PRACTICE.

THAT pharmacy is an "essential specialty" of Army Medical Practice has been acknowledged by the provision of a "pharmacy war course" for the Students Army Training Corps. Reports bearing on the subject will be found under "Correspondence." A number of schools are now engaged in educating and training several hundred young men in pharmacy according to a program which has been determined upon as best adapted for the needs of the Army. The subjects in which the enlisted men adopting this course are to be instructed include the branches taught in schools of pharmacy and, in addition, a study of War Aims and English Composition, and First Aid training.

Prior contention has been that pharmacists, as such, were not needed for the Army; they were not placed in the deferred classes nor assigned to duties for which they were qualified by education and training. Draft boards now may defer their enlistment if the needs of the community require that this be done, and further deference has been shown by giving enlisted men the opportunities of an education in pharmacy. These acts indicate a change of viewpoint relative to pharmacy or a conviction that pharmacists have in the past not been given due consideration.

If these courses had not been opened to prospective pharmacy students there would have been further grounds for criticism, and hence this argues that the action of the Committee on Education and Special Training deserves commendation. It must be borne in mind, however, that many pharmacists, as highly trained as the enlisted students will be, were not given the opportunity to serve in the positions for which they were specially qualified. It is clearly evident that very high appreciation of pharmaceutical attainments has been lacking, and the question of rank still remains, even for those who complete the "pharmacy war course." It is to be hoped that the indorsement given to pharmacy as an "essential specialty" of the Army medical practice will prompt the organization of a pharmaceutical corps as part of the Medical Department of the Army.

There is little satisfaction in the fact that in England about the same conditions obtain as in this country; there are, however, indications of improvement. A recent letter to the Pharmaceutical Society of Great Britain from the Director General of the British Army conveys the information that an Army Council instruction is to be issued embodying the principle of placing a pharmacist in charge of the dispensary of hospitals, and "it is hoped" that pharmacists thus posted will be given the rank and pay of sergeants. The question of higher rank

"is still under consideration." The same letter states that "arrangements have been made to enlist into R. A. M. C. all qualified pharmacists who may in the future be called into service."

When a pharmacist enters the Army and performs the duties of a pharmacist then certainly the service rendered by him is professional, and the fact that in many drug stores pharmacy is a small part has no bearing on the question of his rank or professional standing. The educated pharmacist would gladly discard most of the side-lines if the pharmacy would produce a sufficient income. Medical men usually have more influence with legislative bodies than druggists, but they seldom give strong support to the persistent efforts of pharmacists to secure legislation that will require graduation from a college of pharmacy as a prerequisite to practice pharmacy. If all states had "prerequisite" laws, then progress toward higher qualifications for pharmacists would naturally follow. Medicine will take a long step forward after the war, and it seems highly important that there be closer coöperation of the medical profession with pharmacy and more helpful encouragement given by the Government in order that an American *materia medica* may be further developed. With the beginning of the war our dependence on Europe for drugs was realized; pharmacy measured up to its responsibilities under trying discouragements and difficulties. The efficiency with which the drug industries met every demand made upon them has received favorable comment. As far as we know, there has been no attempt at profiteering and the Schools of Pharmacy or members of the faculties aided in one way or another in the maintenance of proper drug supply, or in training men for dispensing or hospital service.

There is a place for the drug store among our commercial activities and there is a real need for pharmacy. Theoretical ideas that pharmacy can at once be separated from the drug business should be absorbed by the purpose to provide greater and better opportunities for its practice. This cannot be done by discouraging those who earnestly seek to develop pharmacy and place it on a higher plane, nor by permitting merchants, on the one hand, to sell drugs without restrictions, nor, on the other, have physicians dispense medicines, which in many localities has made it absolutely impossible to carry on a pharmacy.

The progress of pharmacy is largely dependent upon medical practice and, reversely, the advancement of the latter will be sustained by progressive pharmacy. Every activity is endeavoring to profit by the lessons of the war, and the blood and treasure so lavishly poured out will have been in a measure wasted if humanity does not profit and benefit by the experience and knowledge gained on the battle-fields and in the hospitals from the treatment of injuries and diseases and a study of the action and production of prophylactic and remedial medicinal agencies.

We are pleased that the indorsement has been given to pharmacy, by the

Committee on Education and Special Training, and hope that there will be a further expression of confidence in its possibilities resulting in the establishment of a pharmaceutical corps as part of the Medical Department of the U. S. Army.

E. G. E.

THE SPANISH INFLUENZA.

IT MAY not be out of place to record in these pages a reference to the prevalence of influenza which has recently become epidemic in many sections of the United States and has prevailed in Europe for a number of months. The death rate in some localities has been seven times that of normal and the number of cases correspondingly large. Frederick E. Niece, a member of the Association residing in Queens Village, Long Island, died of the disease, which he contracted while experimenting to obtain a preventative serum. Death claimed quite a number of physicians and pharmacists. Unfortunately numerous remedies were suggested for the treatment of the infection, the chief object being the profit on the sales. The spirit of real helpfulness, however, largely predominated.

At the Phipps Institute, Philadelphia, the influenza germ was identified by Dr. Paul A. Lewis as Pfeiffer's bacillus, while Dr. Randle C. Rosenberger, bacteriologist at the Jefferson Medical College, has not been able to find the distinctive influenza germ. His finding seems to agree with that of Dr. Ulrich Friedemann, of the Virchow Hospital, Berlin, Germany; he had not found the Pfeiffer bacillus, streptococci and pneumococci being the most common agents of the complicating pneumonias. Dr. Richard Pfeiffer, Breslau, reported the finding of his bacillus in only a few cases.

It is conceded by a number of bacteriologists that the symptomatology and complications of the present epidemic correspond with those of 1889-90. Pfeiffer's bacillus was discovered in 1892. Dr. Kolle reported from Frankfort under date of July 18 that up to that time he had failed to detect Pfeiffer's bacillus in any of the cases he had examined. In practically all cases there were found, however, large numbers of a Gram-positive coccus—often in a pure culture or in symbiosis with pneumococci. The diplococci tended to develop involution forms and to grow in very large chains in the condensation water. He regards them as agents of a secondary infection in the Spanish influenza which he states *may* not be identical with the pandemic influenza of 1889-1893.

E. G. E.

CONDITIONS AFTER THE WAR.

IT CAN safely be said that the beginning of the end of the war is at hand. Matters affecting the drug business quite naturally enter into a discussion in this JOURNAL, of conditions after the war. Immediately after the beginning

of hostilities prices of nearly all drugs advanced, and as a result, an inventory of the average drug stock would have shown a large profit on the investment. The druggist who did not mark up his retail prices in response to the rising market lacked judgment, for such reasonable action could not be construed as profiteering. With the return of peace prices will decline, and it behooves dealers now to buy cautiously. As the value of drug stocks was increased by higher prices the inventories following the conclusion of peace will, in many instances, indicate a loss, for which those who have invested the profits of preceding years in Liberty Bonds will be prepared.

During the war period the cry has been shortage of help; hereafter for a time there will likely be an over-supply, and this may prove more disadvantageous than the previous condition by bringing about a return of unnecessary overhead expenses which were eliminated because employees could not be secured and, realizing this, the public did not complain though deprived of conveniences to which they had been accustomed. Extravagance is recognized as an American failing; we have willingly made sacrifices for the sake of winning the war; most of those who enlisted for the cause of the country did so with becoming patriotism; our soldiers suffered privations and hardships, without complaint; they endured their losses as heroes; but it is doubtful whether the lesson of thrift has been deeply impressed.

We owe a duty to those who served the country and the world; opportunities of education and employment must be given them when they return to civil life, and the drug stores of the country should bear their obligations in this respect in mind. The Government required many thousand employees in the war industries, who will be released, and they, too, have a claim on the public and must not be permitted to remain unemployed.

The return to peace conditions signifies a reconstruction period during which it has been said the mettle of America will be put to a test much more severe than that of the war, in which the armor of right and justice will protect us and only the might of mind will prevail. Of this period Dr. B. C. Hesse said in a prepared address for the Philadelphia Section of the American Chemical Society:

"In the tense industrial, commercial, and financial world-wide struggle that is bound to ensue directly after the close of hostilities, success will in all probability fall in a greater measure to those who have, in advance, prepared a comprehensive workable plan adapted for immediate development and operation, and sufficiently elastic to allow of effective adaptation to changing or unforeseen conditions, than to those who have not so prepared themselves."

The United States has shown its ability to save a world from autocratic and military domination; after peace is established her statesmen, financiers, business men and educators must show their ability to comprehend a vast and compli-

ated situation, to devise measures and supply means to master, control, guide and shape industrial and educational affairs so that the country will hold its front rank among the nations of the world.

Successful competition by the United States with other nations seeking markets for their products will compel the adoption of more scientific methods than have in the past obtained, and to this end the Department of Commerce will become more important and extensive as a source of industrial data for business and manufacturing interests.

Scientific management has been developed as a result of the war and closer contact between labor and capital is now more highly valued. The wonderful achievements of this country would have been utterly impossible without the really big men with these views, who developed the conservation and production plans which with the other equally important promotions enabled the United States to change the course of events in Europe. In the reconstruction following peace it is important that Capital have the viewpoint of Labor and reversely and, above all, that the principle of brotherhood, "Do as you would be done by," be accepted and more generally applied among nations and individuals.

CALOMEL ASSAY (U. S. P.) IMPROVED.

BY A. B. LYONS.

The U. S. P. assay for calomel is neat and often expeditious. Sometimes, however, the calomel is exceedingly slow to dissolve in the prescribed volumetric solution. Increasing the quantity of the iodine solution helps materially. As much as 75 mls of the solution may be advantageously used in place of the 50 mls prescribed.

The difficulty is, however, wholly overcome by the simple expedient of doubling the strength of the reagent. It is as well to prepare a special volumetric solution by dissolving in 50 mls of water 13 grammes of iodine and 20 grammes of potassium iodide, adding a solution of 80 grammes of potassium iodide in 150 mls of water and making up with distilled water to 500 mls, or a little less. Standardize to a fifth-normal strength on an accurately standardized tenth-normal sodium thiosulphate solution.

In the assay use 0.5 Gm. of the dried calomel, 5 mls of water and 20 mls of the reagent, with no additional potassium iodide. Solution of the calomel will be effected in a few minutes. Titrate the residual iodine with tenth-normal thiosulphate solution, remembering to reckon the quantity of iodine solution as equivalent to 40 mls of a tenth-normal solution.

FLUIDEXTRACT OF SQUILL.*

BY R. I. GRANTHAM AND H. C. COLSON, JR.

Some time ago we called attention to the fact that the official dose of Squill preparations was not in proportion to the toxicity required for them by the biological standards of the U. S. P. IX, and we further pointed out that the commercial fluidextracts vary considerably in toxicity. We have also noticed since that time that commercial preparations vary considerably in the amount of total solids (10-30 Gm. per 100 mls) and the percentage alcohol (37-55%) which they contain.

We have deemed it advisable, therefore, to ascertain the cause for these variations and to devise a proper method for making fluidextract of squill. The U. S. P. IX process for making fluidextract of squill prescribes that the drug in *No. 20 powder* be macerated and percolated with *two parts alcohol and one water*. After a *definite volume* of the percolate has been received, it is directed that the alcohol be distilled and the liquid concentrated to a *definite volume*. After allowing the residue to cool, the gum, etc., are precipitated with alcohol and the residue washed with a diluted alcohol (4 parts alcohol and 1 part water). The combined alcoholic liquids are *distilled to a definite volume* and finally enough dilute alcohol is added to make a fluid, each part of which corresponds to one part of drug.

In any process for making fluid squill, the object in view is to obtain a product, of which 1 mil fully represents the active and therapeutic principles of 1 gramme of the drug. The process, which accomplishes this purpose in the simplest, most direct way is of course the best. In our opinion, few persons would say that the U. S. P. IX process is not complicated, but it might be assumed by some that if the directions were carried out properly a uniform product could be obtained.

The difficulties which are encountered in applying the U. S. P. process are: (1) the use of No. 20 powder, which becomes so gelatinous that percolation cannot be carried out; (2) the regulation of the definite volumes in the first and second stages of the operation. Upon this control of volume depend the qualities, chemical and physiological, of the finished product.

Our first experiments were made to find out if squill coarser than No. 20 powder could be used to obtain a satisfactory product. Fluidextracts were therefore made in accordance with the following specifications:

I. Squill No. 20 powder was exhausted according to the U. S. P. IX process, but the drug became so gelatinous that percolation could be perfected only by mixing purified sawdust with the drug.

II. Squill, very coarse powder, U. S. P. IX process. Percolation was satisfactorily carried out.

III. Whole commercial squill U. S. P. IX percolation process, which was satisfactory.

* Read before Scientific Section, A. Ph. A., Chicago meeting, 1918.

The three preparations were examined chemically for total solids and alcoholic contents, and biologically for toxicity by both the one-hour and twelve-hour frog assay methods. The one-hour frog test was made strictly according to the method of the U. S. P. IX. The preparations were also examined by the Houghton twelve-hour frog method, except that in calculating the H. T. U. per mil, 200,000 rather than 100,000 H. T. U. per Gm. of Kombé Strophanthlin was used. The M. L. D. and H. T. U. per mil for a standard F. E. Squill were assumed to be 0.0012 mil per Gm. frog and 80 H. T. U. per mil, respectively.

The chemical and biological tests on preparations I, II, and III are given in the following table:

TABLE I.

| Fluidextract No. | Solid matter in 100 mils. | Alcohol % by volume. | Percentage of toxicity. | | |
|---------------------|------------------------------|-------------------------|-------------------------|------------------|--------------------------------------------|
| | | | 1-Hour frog. | 12-Hour frog. | Ratio between 1-hr. and 12-hr. frog. |
| I..... | 7.2 | 62.5 | 192.0 | 250.0 | 1:1.302 |
| II..... | 5.7 | 72.5 | 138.4 | 175.0 | 1:1.265 |
| III..... | 11.0 | 60.7 | 204.0 | 286.0 | 1:1.402 |

No. 20 powder causes considerable trouble during percolation and the data in Table I indicates that a coarse powder or even the whole commercial squill will give equally good products and at the same time facilitate the carrying out of the percolation process.

IV. This experiment was made to find out if it was necessary to have the finished product as strongly alcoholic as the menstruum which is employed to extract the drug, and which at the same time would retain the original toxicity. For this purpose, the alcohol from 100 mils of preparation No. III was reduced from 60.7 percent to 37 percent. This yielded a cloudy solution which was filtered. This preparation is designated as No. IV, and had 9.4 percent total solids, 37 percent alcohol and toxicities of 140.0 percent and 187.5 percent by the one-hour and 12-hour frog methods, respectively. It will be seen by comparison of assays on fluidextracts III and IV that only 1.4 percent total solids and 31 percent toxicity were lost, when calculated on the assumption that fluidextract No. III contained 100 percent total solids and toxicity, respectively. The lower toxicity may be due to the effect of the heat applied in reducing the alcoholic content.

Our next experiments were made in order to determine the proper solvent for extracting the drug. The following fluidextracts were prepared, using in each case very coarse squill:

V. 100 Gm. of squill was exhausted with hot water, the solution concentrated to about 60 mils and then sufficient alcohol was added to obtain 100 mils.

VI. Fluidextract was made according to the U. S. P. VII process. A product was obtained which separated into two layers (30 parts top layer and 70 parts bottom layer).

VII. The drug was extracted with 90 percent alcohol, the alcoholic solution was evaporated and the residue taken up with 50 percent alcohol. The fluidextracts thus prepared were examined as to the amount of solid matter and the percentage of alcohol which they contained, and they were also tested physiologically, both by the one-hour frog method and the twelve-hour frog method.

The following preparations, namely, VIII, IX, and X, were each made in triplicate, and are designated as (a), (b) and (c). Preparations (a) in each case were made from one lot of drug, and preparations (b) and (c) in each case, from a second lot of drug.

VIII. (a) (b) (c) Squill extracted according to the U. S. P. IX method.

IX. (a) (b) (c) 100 Gm. of squill was digested with two portions of hot water (750 mls and 250 mls). The mixture was strained through cheesecloth. The bulk of the strained solution was then evaporated to a syrupy consistence, 200 mls of alcohol were added, the mixture stirred well and the alcoholic liquid decanted. The combined alcoholic liquids were then concentrated and the residue dissolved in sufficient dilute alcohol to make 100 mls.

X. (a) (b) (c) Drug was extracted with 80 percent alcohol and then proceeded as under VII.

These preparations were examined chemically and biologically with results as recorded in Tables II and III.

TABLE II.

| Fluidextract No. | Solid matter in 100 mls. | Alcohol % by volume. | Percentage of toxicity | | |
|---------------------|-----------------------------|-------------------------|------------------------|-----------------|--------------------------------------------|
| | | | 1-Hour frog | 12-Hour frog | Ratio between 1-hr. and 12-hr. frog. |
| IV | 9.4 | 37.0 | 140.0 | 187.5 | 1:1.340 |
| V | 36.0 | 38.0 | 78.5 | 97.8 | 1:1.245 |
| VI | 53.6 | 42.9 | 213.0 | 220.0 | 1:1.041 |
| VII | 3.4 | 50.0 | 120.0 | 132.2 | 1:1.110 |

TABLE III.

| Fluidextract No. | Solid matter in 100 mls. | Alcohol % by volume. | Percentage of toxicity | | |

| a. | 16.2 | 50.0 | 128.0 | 153.8 | 1:1.202 |
| b. | 13.1 | 51.0 | 165.0 | 105.6 | 1:0.640 |
| c. | 14.8 | 49.5 | 97.8 | 114.4 | 1:1.170 |
| Averages | 14.7 | 50.4 | 130.3 | 124.5 | 1:0.957 |

DISCUSSION OF THE RESULTS.

The results given in Tables II and III show that water extracts the toxic principles of squill together with the gums and sugars which must finally be eliminated by precipitation with alcohol. By using 64 percent alcohol (U. S. P. IX solvent), we obtained the toxic principles, also the gums and sugars which must be removed by precipitation. Nothing was gained by the use of a 70 percent alcohol (U. S. P. VII 1890 solvent). Our experimental data show further that an 80 percent alcoholic menstruum gives a product of high toxicity and one in which the gums and a greater part of the sugars remain in the marc. The use of this solvent decidedly simplifies the unwieldy U. S. P. IX process and at the same time produces a fluidextract of squill containing a maximum of the therapeutic principles of the drug. By employing a 90 percent alcoholic menstruum, we obtained a product which was nearly as toxic and one which did not contain much

extractive matter. While the presence of gum, etc., does not greatly affect the toxicity of the preparation, they might as well be eliminated.

The U. S. P. IX process is capable of yielding a satisfactory product, and may be fundamentally correct. The process, however, is very unwieldy and evidently its practical application to large scale manufacture was not taken into consideration when it was designed. In the U. S. P. IX process, the volume of the original residue is difficult to control, hence by this process it is almost always impossible to obtain fluidextracts which are uniform in alcoholic strength and percentage of extractive matter.

While it is not within the scope of this paper to discuss the methods of biologic estimation of drugs in detail, we wish, however, to take this opportunity to say a few words regarding the relative merits of the two frog assay methods employed in this investigation.

A satisfactory biologic assay should give results which are comparable to chemical analyses in respect to accuracy, absolute as well as relative. The factor, which enters into all frog assay methods and which tends more than any other to prevent consistent and reliable results, is the rate of absorption of the drug. This variation in absorption may be due either to an idiosyncrasy of the test animal, temperature of medication (which should of course be kept constant) during the assay, or finally the nature and concentration of the drug itself. The 12-hour method practically eliminates this variability, as it allows sufficient time for complete absorption of the drug, regardless of the conditions which may be delaying absorption. As a result of this, the end-point in the 12-hour frog tests is never in doubt, that is, the animal is either dead or alive. On the other hand, the one-hour frog method of the U. S. P. IX leaves the interpretation of the end-point entirely to the experience and judgment of the operator. The degree and rate of absorption of the drug varies greatly in the one-hour frog tests and is the principal cause of the unreliability of this method. While the 12-hour method takes longer to complete, the cost per assay is only half as much as for the one-hour method, viz.: (\$0.60 as compared with \$1.25).

It has already been stated in this paper, that in the 12-hour frog tests the percentage toxicities of the squill preparations were calculated on a basis of 200,000 H. T. U. per Gm. of Kombé Strophanthin. Repeated tests on samples of Kombé Strophanthin from the largest manufacturers have always shown that in the 12-hour frog test, the M. L. D. for K. Strophanthin is approximately 0.000,0005 Gm. per Gm. frog rather than the average M. L. D. of 0.000,0010 Gm. per Gm. frog given by some authorities.

It is, therefore, the greater consistency, reliability and accuracy of the 12-hour assay, when made from season to season and with different lots of frogs, that makes it preferable to the official one-hour frog test for biologic evaluations of heart tonic drugs, and it is the method which furnishes the basis for discussing the relative toxicities of our squill preparations.

SUMMARY.

1. A satisfactory fluidextract of squill can be made with a powdered squill coarser than No. 20.

2. When either a 64 percent alcoholic menstruum (U. S. P. IX process), water, or a 70 percent alcoholic menstruum (U. S. P. VII process), is employed, the toxic principles of squill are extracted together with the gums and sugars which must later be eliminated by precipitating with a stronger alcohol.

3. The most satisfactory menstruum for extracting squill was found to be an 80 percent alcohol. This solvent removes a maximum of the therapeutic principles and at the same time leaves the gums and the sugars in the marc. The use of 80 percent alcohol simplifies the preparation of fluidextract squill and the product which is obtained is more uniform and the cost of production is greatly reduced.

4. The 12-hour frog method is more satisfactory and accurate than the official U. S. P. IX one-hour frog method for the biologic estimation of the relative toxicities of fluidextract squill or similar preparations.

COMMERCIAL VIBURNUM BARKS AND PREPARATIONS.*

BY ARNO VIEHOEVER, CLARE OLIN EWING AND JOSEPH F. CLEVINGER.

Among the domestic drugs which are collected rather extensively and used in medicinal preparations, mention must be made of two or three *Viburnum* species, namely *Viburnum opulus* L. (Cramp bark) and *Viburnum prunifolium* L., or *Viburnum lentago* L. (Black Haw bark). The demand for *Viburnum opulus* especially has been considerable during years past. The recent report in literature, referred to later, that *Viburnum opulus* was substituted by *Acer spicatum* L., to which the name cramp bark was given, therefore created considerable interest and suggested a collection of samples in order to verify the fact and the extent of the substitution. The survey was extended to the manufactured preparations and also to black haw bark and its preparations.

The substitution of *Acer spicatum* as "Cramp bark" for *Viburnum opulus* dates at least as far back as 1892. Here a bark obtained from a manufacturing house was submitted as "probably true Cramp bark, *Viburnum opulus*" to the Research Committee "C" of the Committee on Revision of the United States Pharmacopoeia (Sayre and Denniston 1898). The material, as we know to-day, however, consisted not of cramp bark, *Viburnum opulus*, but of maple bark, *Acer spicatum*.

The description which was given for cramp bark in the Pharmacopoeia VII and VIII, consequently was erroneous. In the latest (IX) revision of the U. S. Pharmacopoeia the description for this product has been omitted altogether, being given correctly now in the National Formulary (1916), with the omission, however, of the term "Cramp bark." Some dealers still list under the name "Cramp bark" or "So-called Cramp bark," the material obtained from *Acer spicatum*, and certain manufacturers appear to favor the application of the term to it.

In this connection it is interesting to note that leading pharmacognosists consider that the name "Cramp bark" applies to *Viburnum opulus* L. and not to *Acer spicatum* (Rusby, 1915, 1916; Kraemer, 1915; and Sayre, 1917). The following excerpts from an article on "Spurious Drugs" by John Uri Lloyd (1915), are of special interest:

"The use of *Viburnum opulus*, cramp bark, dates back to domestic medicine in the past century, its most conspicuous therapeutic introduction, perhaps, being in the Botanic Physician (1844), a work of 210 pages, by Dr. Elisha Smith, to which Dr. John King often referred in the first edition of his Dispensatory (1852). At that time, and for many years afterward, *Viburnum opulus* was employed in but small amounts outside the eclectic school of medicine. There was consequently no difficulty in obtaining, true to name, the moderate amount necessary to supply the demand for the drug. Came next a commercial demand for 'Viburnum,' instigated by proprietary preparations. *Viburnum opulus* was then the only drug recognized under the name 'cramp bark' (see the old American domestic remedy publications), and this demand for 'Viburnum' was abruptly stimulated. *Viburnum opulus* not being commercially very abundant, the drug practically disappeared from the market, the possible supply being insignificant in proportion to the amount required in commerce. It was then inexplicably replaced, under the name 'cramp bark' (which name originally applied to *Viburnum opulus* only), by the bark of *Acer spicatum*, or mountain maple, to which so far as I know, the name 'cramp bark' had not pre-

* Contribution from the Pharmacognosy Laboratory, Bureau of Chemistry, Department of Agriculture, Washington, D. C.

TABLE I.—EXAMINATION OF COMMERCIAL SAMPLES OF CRAMP BARK.

viously been applied." * * * * In this connection we might emphasize the fact that true "cramp bark" is unquestionably *Viburnum opulus*, but undoubtedly the bark of *Acer spicatum* has long been about the only "cramp bark" on the general market. "As a historical record it may be added that the early eclectics used, under the names 'Cramp bark' and 'High cranberry' the bark of *Viburnum opulus* only, a shrub native to the East, and well known to them."

It was pointed out by Farwell (1913) that the bark of the mountain maple (*Acer spicatum*) was being substituted for cramp bark (*Viburnum opulus*). To verify this statement and to determine the extent of such substitution commercial samples of "cramp bark" were collected throughout the United States in 1915 and examined as to their identity.¹ The results of our observations are incorporated in Table I, from which it may be seen that of the fifty samples examined, forty-eight proved to consist of the bark of *Acer spicatum* L. The other two were derived from *Viburnum opulus* L. Zufall (1915) and Rusby (1916) also state that samples of "cramp bark" proved to be maple bark and F. Beringer, as well as H. Kraemer reported similar findings to meetings of local branches of the American Pharmaceutical Association.

A similar examination of commercial samples of bark of *Viburnum prunifolium* showed that six were derived from the official species, *Viburnum prunifolium* L., or *Viburnum lentago* L., while one was derived from an unofficial *Viburnum species* (Table II). Both tables, furthermore, show that sample bearing the same label were found in all degrees of physical state, from whole to finely powdered bark, some devoid of wood, others containing very considerable amounts.

In view of the fact that substitution was observed and especially that such a large percentage of the samples of cramp bark proved to be spurious, a survey was made of *Viburnum* preparations in general on the market, in order to ascertain if similar conditions prevailed. Samples were collected throughout the United States in 1916, and examined as to their identity. The results of this examination are incorporated in Table III. It will be noted that in every instance preparations of *Viburnum prunifolium* were apparently true to label. On the other hand, of the fifteen samples supposed to be made from *Viburnum opulus*, only three were found to give a positive test for *Viburnum*. The other samples gave the reaction for *Acer* species, and in view of our findings regarding commercial "cramp barks," were very probably prepared from the bark of *Acer spicatum*. In this connection it is interesting to note that recent preparations of a certain manufacturer gave positive tests for *Viburnum*, whereas earlier preparations of the same manufacturer gave a reaction for *Acer*, thus indicating that correction of the error had been made in one instance at least, since the attention of the trade was called to the substitution of *Acer spicatum* for *Viburnum opulus*.

On account of the great extent of the substitution of *Acer spicatum* for *Viburnum opulus*, it seems advisable to again call the attention of the trade to this fact and to point out easy means of differentiation between the two by simple chemical tests, as well as by macroscopic and microscopic characteristics. (See S. R. A. Chem. 20, Item 216, 1917.)

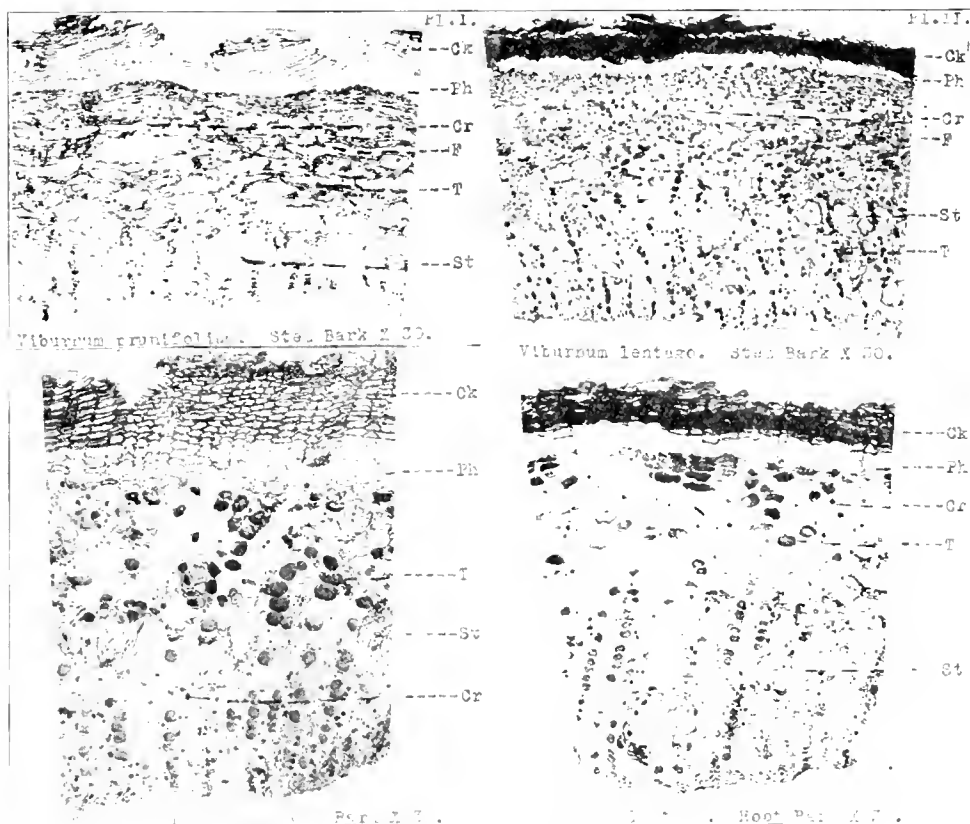

¹ In addition to authentic material collected by ourselves, authentic samples were obtained from C. J. Sargent, F. M. Crayton, and especially O. A. Farwell, to whom we wish to express our appreciation for their assistance.

The characteristics of the barks of *Acer spicatum* and of the official *Viburnum* species have been pointed out before in greater or less detail. Denniston (1898) has made a very thorough study of a number of American *Viburnums*, including *Viburnum opulus* L., *Viburnum prunifolium* L., and *Viburnum lentago* L., and has given accurate descriptions of the barks. Unfortunately, however, the material supplied to him as *Viburnum opulus* was in fact *Acer spicatum*, and his descriptions under the caption "*Viburnum opulus*" covers the main characteristics of mountain maple bark. Farwell (1913) described the morphology of the leaves as well as the histology of the bark of the American-grown *Viburnum opulus*, which he considers as *Viburnum opulus* L. var. *americanum* Aiton. We have as yet no evidence of any anatomical difference between the bark from *Viburnum opulus* and this variety *americanum*. Zufall (1915) suggested a revised official description of *Viburnum opulus*. His statement concerning the absence of oxalate crystals in maple and of fibers in cramp bark, as we understand from a personal communication, refers to the absence of oxalate rosettes in the one bark and the usual lack of fibers in the other. The author thus agrees with our findings.

The National Formulary IV (1916) gives a satisfactory description of *Viburnum opulus*, although omitting the name "cramp bark" altogether. The United States Pharmacopoeia VIII (1905) gives these names synonymously, but includes an erroneous description which applies to mountain maple instead of true cramp bark. Since these descriptions are easily accessible and generally satisfactory we consider it unnecessary to repeat them in detail. We desire only to point out the most striking characteristics useful for the identification and differentiation of the barks of the above-named species.

The bark of *Acer spicatum* is generally thicker and darker gray than that of *Viburnum opulus*, and usually has some woody tissue attached, while in *Viburnum opulus* the presence of attached wood is less frequent. The fracture of the bark of *Acer spicatum* is tough and very fibrous, due to the presence of large and numerous groups of long sclerenchyma fibers both in the stem and root bark. The fracture of *Viburnum opulus* is short and weak, since sclerenchyma fibers are usually absent in the secondary bark and are few and scattered in the primary cortex of the young bark. The bark of *Viburnum opulus* contains very numerous rosette crystals, scattered throughout the tissue of the inner bark, while *Acer spicatum* contains numerous prismatic crystals which occur in crystal fibers, generally accompanying groups of bast fibers. These are seen to best advantage in longitudinal radial sections. The root and stem barks of *Acer spicatum* are very similar in structure, while the root bark of *Viburnum opulus* differs from both of these and from its own bark as well, in showing almost an entire absence of stone cells or sclerenchyma fibers.

Viburnum prunifolium and *Viburnum lentago* both have short, weak fractures. The stem barks resemble each other very closely, but in the samples we examined the former had fewer and smaller groups of sclerenchyma fibers in the primary cortex and the groups of stone cells in the secondary bark were generally larger and more numerous. Their dimensions varied between 290-680 microns by 170-290 microns in cross section. The root barks also had a strong similarity to each other, but differed from the stem barks in that no sclerenchyma fibers were observed.

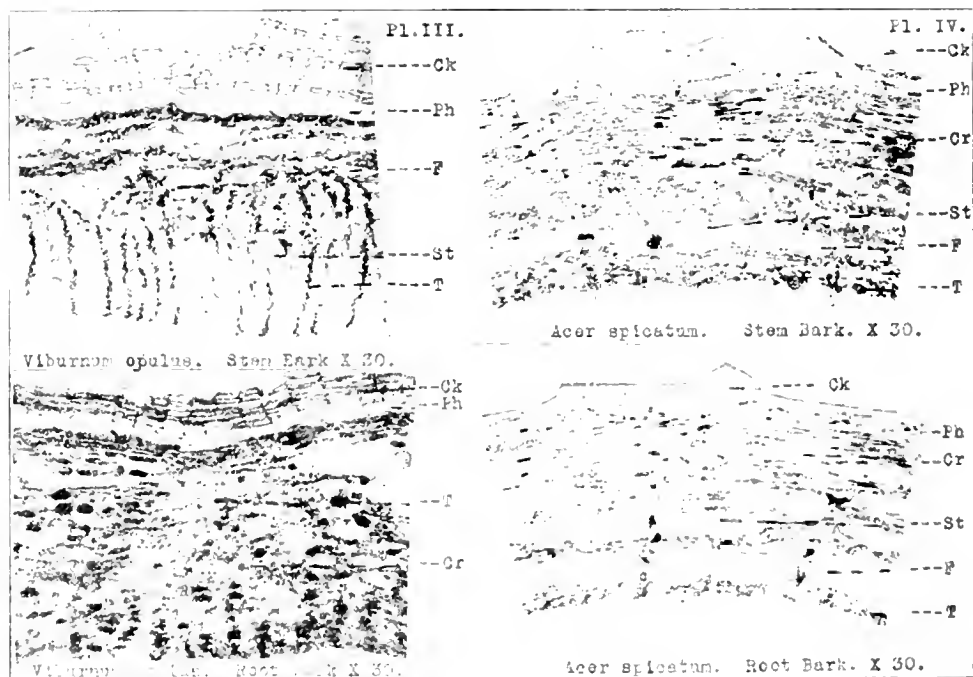

Viburnum prunifolium Plate I.—Ck, cork; Ph, phellogen; Cr, calcium oxalate crystals; St, stone cells; T, tannin cells; F, bast fibers. Plate II.—*Viburnum lentago*, abbreviations apply as in preceding.

The tannins are for the most part similarly located in all of the *Viburnum* barks described above. They occur chiefly in the medullary rays, but are also found scattered here and there in the parenchyma cells of the outer cortex. In the case of the *Acer* bark the latter type of distribution predominates. While tannins do occur also in the medullary rays they are possibly less numerous than in the case of the *Viburnum* barks, and are not quite so prominent. (See Plates I to IV.) The tannins of *Acer spicatum* can be distinguished from those of *Viburnum* species by their color reaction with freshly prepared one-tenth percent ferric chloride solution.

It was pointed out by one of us (Viehöver) at the October 1916, meeting of the American Pharmaceutical Association that both *Viburnum opulus* and *Viburnum prunifolium* contain tannins which give a green color or precipitate with iron salts, whereas *Acer spicatum* contains a tannin which gives a blue tannin or precipitate with iron salts. The reaction is given by both ferrous and ferric salts, but *freshly prepared* ferrous sulphate solution was selected because this solution possesses very little interfering color. This is advantageous, especially in the case of *Viburnum* preparations, where the color obtained is sometimes quite delicate.

In the case of the whole barks, the test was carried out by applying a drop

Viburnum opulus. Plate III. — Ck, cork; Ph, phellogen; Cr, Calcium oxalate, crystals; T, tannin cells; E, bast fibers; St, stone cells. Plate IV. — *Acer spicatum*, abbreviations apply as in preceding.

of dilute (1:1000) ferric chloride or ferrous sulphate solution directly to the inner surface of the bark. In the course of a few minutes a distinct green color appeared in the case of *Viburnum opulus* and *Viburnum prunifolium*, whereas a very deep blue to bluish black color developed in the case of *Acer spicatum*. The ground barks were tested by applying the reagent to the powder and examining in doubtful cases under the microscope.

Another simple and striking test is the red lignin reaction obtained in the case of maple bark, if a drop of phloroglucin-hydrochloric acid (phloroglucin 0.1 Gm., alcohol and concentrated hydrochloric acid 8 Cc., each) is applied to the inner side of the bark due to the numerous lignified sclerenchyma fibers in the bark. Some wood fragments are often attached to the barks; these have to be removed before making the test, which can, of course, also be applied to a section, preferably a longitudinal one. The phloroglucin-hydrochloric acid should be comparatively fresh and not too deeply colored.

The hydrochloric acid contained in the phloroglucin solution will furthermore develop, especially in the case of freshly collected *Viburnum* bark, the odor of valerianic acid, which is absent in maple bark.

In applying the tannin test to pharmaceutical preparations, the procedure was as follows:

Ten mils of the sample containing alcohol was diluted with about three volumes of water and shaken out with about 15 mils of ether. The ethereal layer was filtered and shaken gently in a test tube with an equal volume of water containing two drops of a freshly prepared saturated ferrous sulphate solution. A green color in the lower aqueous layer indicated a *Viburnum* species; a blue color indicated an *Acer* species.

In the case of preparations containing very small amounts of *Viburnum* accompanied by large amounts of interfering substances, it was necessary to evaporate a larger volume to dryness, take up with about 15 mls of 95 percent alcohol, dilute with water and proceed as usual.

St. John (1916) has pointed out that better results are obtained by shaking out with ether than with petroleum ether. We account for this by the fact that, although the tannins are insoluble in both petroleum ether and absolute ether, when a hydro-alcoholic extract is shaken out with ether, enough alcohol and water is taken up by the ether to carry along with it some of the dissolved tannins which are then tested for with the ferrous sulphate solution.

To confirm the results of the tannin test as applied to the pharmaceutical preparations, they were further tested in the following manner for the presence of valerianic acid, which is yielded by both *Viburnum opulus* and *Viburnum prunifolium* (Wehmer, 1911):

A small portion (several mls) was made alkaline with dilute sodium hydroxide, boiled to expel most of the alcohol, acidified with dilute sulphuric acid and warmed. In every instance where a *Viburnum* species had been indicated by the tannin test, the characteristic odor of valerianic acid developed.

In order to confirm the presence of valerianic acid, in one instance a larger amount of the preparation was neutralized with sodium bicarbonate, evaporated on a steam bath, acidified with dilute sulphuric acid and distilled with steam. The distillate was saturated with salt, shaken out with ether and the ethereal solution evaporated on the steam bath until the odor of ether was no longer perceptible. The remaining liquid was distilled and fractionated. It consisted largely of isovalerianic acid boiling at 170° and also probably contained a very small amount of normal butyric acid (b. $162-3$). The isovalerianic acid was identified further by the microchemical characteristics of the copper, zinc and mercury salts (Behrens, *Mikrochemischen Analyse*, 1897). For this purpose the fraction containing mainly isovalerianic acid was treated with varying concentrations of solutions of copper acetate, mercuric nitrate, and zinc nitrate, the latter yielding the best results. When a small amount of alcohol was added and a too rapid evaporation was prevented by carrying out the reaction in a moist chamber, the crystallization was facilitated. Notwithstanding this, considerable difficulty was experienced in obtaining the copper salt, probably due to the presence of a small amount of butyric acid which is known to interfere with this reaction. While characteristic crystals were obtained with all three reagents, the least difficulty in obtaining satisfactory results was experienced with the zinc. The characteristics of the crystals obtained are shown in Fig. 1. The butyric acid was indicated by the development of an odor resembling pineapples,

FIG. 1.

- A. Copper valerianate. $\times 130$.
- B. Zinc valerianate. $\times 130$.
- C. Mercury valerianate. $\times 130$
After Behrens.

due to ethyl butyrate, when a drop of the first fraction was heated with several drops of ethyl alcohol and one drop of concentrated sulphuric acid. The material at hand was insufficient to prepare salts of the acids for further macroscopic confirmation.

SUMMARY.

- (1) The bark of mountain maple (*Acer spicatum*) was found to be almost entirely substituted for true cramp bark (*Viburnum opulus*).
- (2) All samples of black haw (*Viburnum prunifolium* or *Viburnum lentago*) proved to be genuine with the exception of one, obtained from a non-official *Viburnum* species.
- (3) The preparations of black haw were made from *Viburnum* barks, while those of cramp bark were mostly manufactured from *Acer* species.
- (4) The tannins in the barks give different color reactions with iron salts; blue in the case of *Acer* and green in that of the *Viburnum* species. These reactions can be used to distinguish the barks as well as their preparations.
- (5) The tannins are distributed in the parenchymatic tissue, but can most easily be seen in the medullary rays.
- (6) Maple bark can furthermore be readily distinguished from the *Viburnum* barks by the intense red coloration when the inner bark is treated with phloroglucin-hydrochloric acid solution; in the case of *Viburnum* barks, more than a faint reaction, if any, is rarely obtained.
- (7) Among the differentiating tests of interest are those which were used to obtain and identify valericianic acid, yielded by the *Viburnum* barks but not by the *Acer* barks.

WILD ANTHEMIS—A POSSIBLE MATRICARIA ADULTERANT.*

BY C. W. BALLARD.

Roman Chamomile or *Anthemis nobilis* L., was official in a previous edition of the U. S. Pharmacopoeia and this authority specified that the drug be obtained from cultivated plants. The product of wild growing plants contains more volatile oil and bitter principles. It is probably more active than the cultivated product. As the drug is used almost entirely as a carminative the milder and more agreeable flavor of the cultivated flowers has resulted in their displacing wild anthemis. It is recorded that anthemis infusions will, in some instances, cause nausea and it is probable that if wild anthemis were used in their preparation this undesirable property will be more marked.

* Prepared for Scientific Section, A. Ph. A., Chicago meeting, 1918.

The writer recently had occasion to examine a sample of wild anthemis which was first offered under the designation "chamomile" or "Spanish chamomile." The title "chamomile" is manifestly erroneous, as in the present revision of the Pharmacopoeia the terms "chamomile" and "wild chamomile" are stated as synonyms for *matricaria*. The title "Spanish chamomile" is also untenable because the National Dispensatory reserves this as a synonym for *Anacyclus Pyrethrum*. The materials of the sample were finally classified as *Anthemis nobilis* (wild), by different pharmacognosists. This article is rarely seen upon the market and because of its appearance it would hardly be accepted in crude drug circles as Roman chamomile, although it might be mistaken for the so-called Hungarian or German chamomile (*Matricaria*). The drug trade has been accustomed to handling the cultivated anthemis which was formerly official; their customers recognize this variety as Roman chamomile and possibly know no other.

Wild anthemis flowers in the whole state show a degree of similarity to those of *matricaria* and this likeness might possibly cause confusion and errors in labelling. The most apparent characters of these flowers are the size and peculiar odor. They are of the usual composite type with a single circle of white ray florets and the yellow disk florets crowded upon the receptacle. Although the inflorescence is similar, it is about three times larger than that of *matricaria*. The odor is very penetrating and resembles that of amyl acetate, being very different from the mild and pleasant odors of *matricaria* and cultivated anthemis.

The botanical points of difference and relationships between cultivated anthemis, wild anthemis and *matricaria* might be summarized as follows:

| | Anthemis cultivated. | Anthemis wild. | Matricaria. |
|------------------------|--------------------------------------------------------------|--------------------------------------------------------------------------|-----------------------------------------------------------------|
| Type of inflorescence. | Compound; white ray-flowers in many series | Compound, white ray-flowers in single series | Compound; white ray-flowers in single series |
| Involucre | Bracts elliptical and pubescent; 2-3 series | Bracts obtuse and pubescent; scarious margins, imbricated in many series | Bracts oblong obtuse (oblanccolate); imbricated in many series |
| Receptacle..... | Conical or convex; solid, chaffy | Conical or convex, solid, chaffy at apex | Ovoid-conical, hollow, not chaffy |
| Ligulate florets..... | Numerous; in several series, pistillate; 3 toothed, 4 veined | Numerous (12-18) in one series, pistillate; 3 toothed, 3-6 veined | Numerous (10-20) in one series, pistillate, 3 toothed, 4 veined |
| Disk florets..... | None or few; perfect | Numerous; perfect | Numerous; perfect |
| Achene | Oblong; obtusely three-angled; pappus none | Oblong; pappus none | Obovoid; 3-5 ribbed, pappus none or mere membrane |

Powdered wild anthemis shows resemblances to both anthemis and *matricaria* in that the characteristic trichomes of the former and the numerous pollen grains

Wild anthemis ($\times 65$). 1, Bract tissue. 2, Petal tissue from ligulate floret. 3, Trichome from bracts ($\times 80$). 3', Trichome from stem. 4, Petal tissue of disk florets. 4', Petal tissue with rosette crystals. 5, Stigma from disk floret. 6, Fibrovascular tissue of stem. 7, Tissue of filament. 8, Anther tissue. 9, Pollen.

of the latter are present. At first sight it would appear as if the material consisted of a mixture of both chamomiles. The tissue elements present are those of the involucre, ligulate florets, disk florets and stems.

Involucre.—Fragment, of this tissue appear as long, white, polygonal cells without papillate surface. Simple multicellular trichomes with long, terminal cells similar to those commonly found in anthemis are attached to the outer surfaces of the bracts. In powdering, these trichomes become detached and appear free in the field.

Ligulate Florets.—This tissue appears in the form of irregular, white cells bearing prominent papillae and identical with the corresponding tissues of anthemis. Many of the cells contain small rosette crystals. The papillae on the surfaces and margins of the ligulate florets of *matricaria* are broader than those of anthemis and wild anthemis but are not as prominent.

Disk Florets.—The tissues of the disk florets include a membranous calyx similar in structure to the chaffy bracts. Corolla fragments with attached remnants of both androecium and gynaecium are also present. Referring to the botanical summary it will be noted that the receptacle of wild anthemis is chaffy and the same condition prevails in the cultivated anthemis. Trichomes of a type similar to those described under the involucral tissues, may be attached to portions of these chaffy scales. The corolla fragments are composed of irregular yellow cells which, with the possible exception of the lobes of the tube, are sparingly papillate. The stamen tissues appear as fragments of long, deep yellowish, pitted and striated cells. Pollen grains are fully as numerous as in *matricaria* and are of the spinose and three-pored type. The stigma and style tissues consist of thick fragments showing small, yellow, rectangular cells with their exposed surfaces covered with papillae. The papillae of the stigmatic surfaces are especially large.

Stem.—The stem tissues include short, thin-walled fibers, spiral vessels and an epidermis showing few stoma but numerous trichomes of two types. One variety of trichome is very similar to those found attached to the bracts but is rather smaller. The second type of trichome is curved, multicellular and with thick-walled terminal cell.

The present revision of the Pharmacopocia does not include a histological description of *matricaria* but the details of its microscopical structure will be found in most of the standard reference books on pharmacognosy. Anthemis is similarly described in these texts. By reference to such descriptions it will be apparent that the histologic distinctions between wild anthemis, cultivated anthemis and *matricaria* may be covered in the following brief statements:

Wild Roman anthemis chamomile is most easily distinguished from Roman chamomile (*Anthemis*, cultivated) by the numerous spinose pollen grains and the abundance of yellow stamen and disk floret tissues.

Wild Roman chamomile may readily be distinguished from the wild, Hungarian or German chamomile (*Matricaria*, U. S. P.) by the numerous trichomes of the anthemis type.

THE SEASONAL VARIATION OF ACIDITY, TOXICITY, AND ALKALOIDAL CONTENT OF THREE SPECIES OF LARKSPUR.

BY O. A. BEATH.

GENERAL DESCRIPTION.

The three species of larkspur selected in this investigation represent distinctive altitudes and habitats. The plains type (*Delphinium geyeri*), commonly called low larkspur, grows on the plains of Wyoming and Colorado at altitudes ranging from five to seven thousand feet. It usually appears during May, and under normal conditions of growth, may be found in full bloom the latter part of June. After the flowering stage the plant dries up and rapidly disappears from the range. This species is a dangerous one from the time it appears until the flowers are well developed.

The next species in order of elevation is represented by *Delphinium glaucescens*. This plant grows in the shaded areas of canyons and mountain sides at an altitude of about eight thousand feet. As a general rule this species appears in the early part of June and is in full bloom by the middle of July. On account of its habitat the plant remains fairly green until the seeds are well developed. The losses from this plant are insignificant.

Delphinium subalpinum (*D. barbeyi*), commonly called the "tall larkspur," grows at elevations ranging from nine to thirteen thousand feet. It grows largely in the open although one may find occasional patches partially shaded. On account of the climatic conditions encountered at higher altitudes, this plant has a variable growing season. *D. subalpinum* is one of the most poisonous of the larkspurs.

ACIDITY.

The expressed juice of the larkspurs is strongly acidic, and if appreciably diluted the concentration increases. Wicke¹ reports the free acid of *D. consolida* to be aconitic acid. His conclusion was based upon the fact that the silver salt had the same chemical composition as silver aconate, therefore, aconitic acid. The native larkspurs yield an acid having the chemical composition of $C_6H_6O_6$, but having physical and chemical properties quite different from those exhibited by the normal acid. It appears to be one of the two possible isomers. The acid obtained from the native larkspurs melts at $166-7^\circ C.$, is non-toxic and optically inactive. It is very soluble in ether, alcohol and water. The silver salt detonates when heated slightly. The ethyl ester boils under a pressure of 25 mm. at $171-2^\circ C.$

In addition to the free acid necessary to form the water-soluble salts (alkaloidal) the plant produces a considerable excess. The acid also enters into chemical combination with a crystalline alkaloid to produce an amorphous complex, the latter being much more potent than any of the crystalline derivatives.

Figure 1 illustrates in a general way the seasonal distribution of the uncombined acid. It is clear that in the early periods of development the relative quantity of acid is quite uniform for the three species. There is no apparent correlation between the seasonal variation of acid and crude alkaloid.

¹ *Annalen der Chemie*, Vol. 90, pp. 98-9.

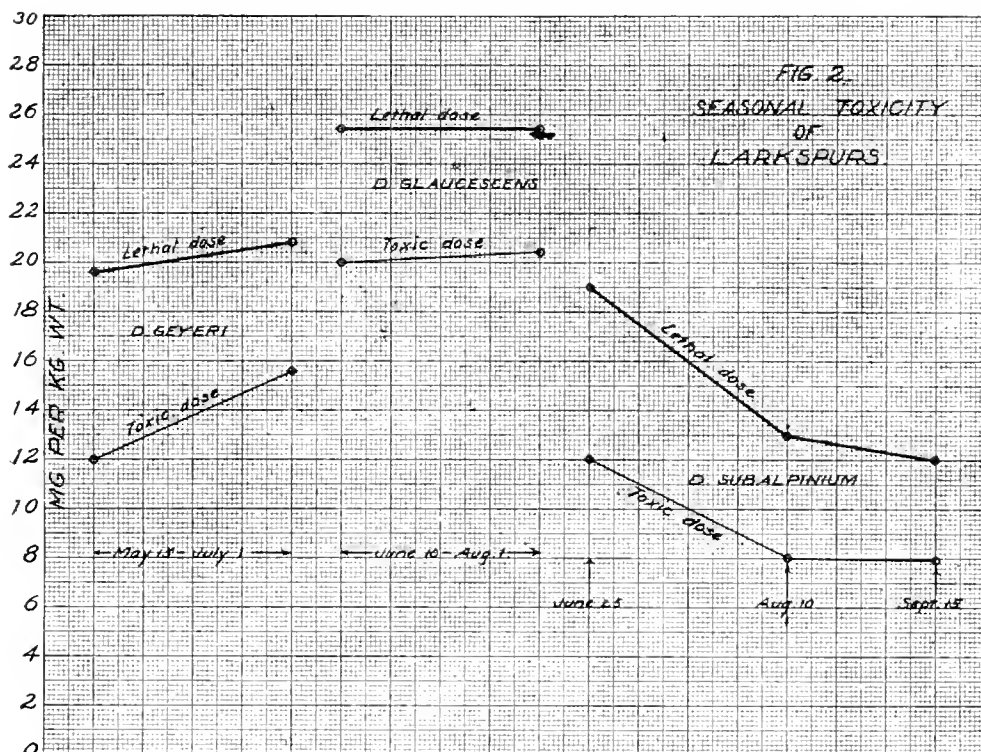

The relation of acid and toxicity will be discussed in another part of this paper.

TOXICITY.

The contributions relative to the seasonal variation of larkspur toxicity have not been consistent. The statement has been made, and seems to be borne out by range observers, that the larkspurs, as a rule, are more poisonous in the early stages of growth. Other contributing factors are involved while the plants are immature and must be carefully considered before final conclusions are drawn.

The experiments were undertaken to determine the period of maximum and minimum potency of the crude larkspur poisons at distinct stages of growth. The plants (whole) were carefully selected, dried, and reduced to a uniform powder. After percolating with alcohol the oils, fats, and resins were extracted with petroleum ether. The crude alkaloidal residues were taken up with seventy per cent alcohol and made up to definite dilutions. The extracts were introduced intravenously into full-grown rabbits. The tests were made in duplicates and the average results tabulated. Figure II illustrates the relative amounts necessary to kill and to produce symptoms. *D. glaucescens* is shown to be much less poisonous than the other two species, although exhibiting no apparent change with the advance in growth. The tall larkspur differs from the other two types in that, as the flowering stage approaches, the lethal dose becomes comparatively small. The crude alkaloid of the seeds has practically the same value as that found in the whole plant (flowering stage).

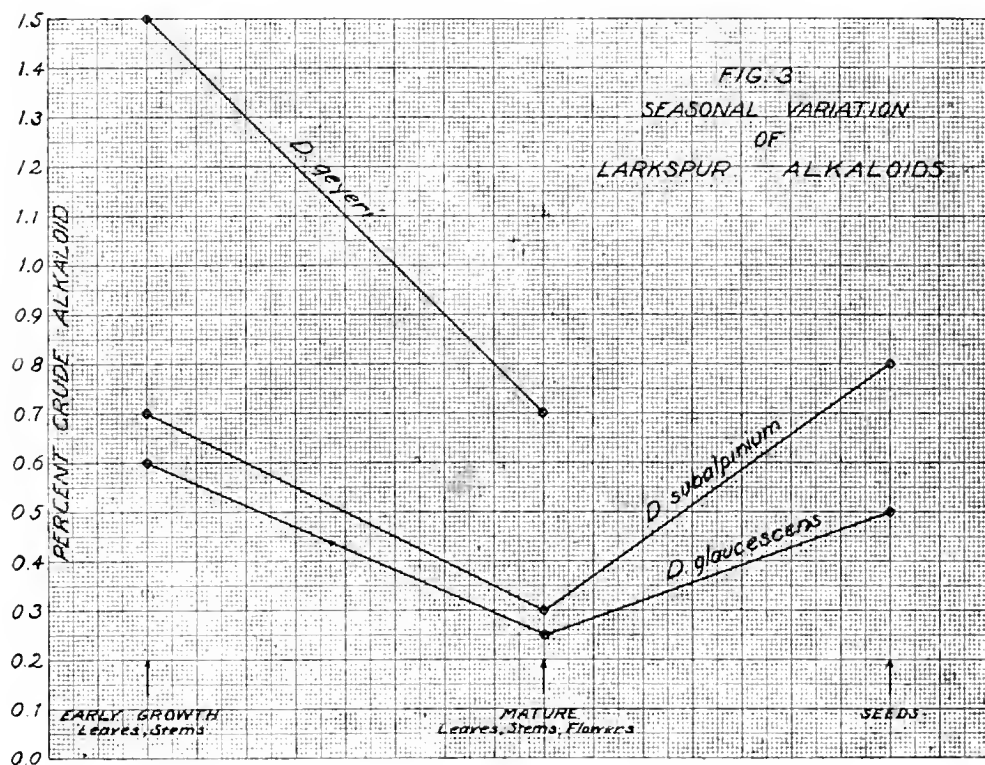

If the statement is correct that the larkspurs are more dangerous during the early periods of growth, clearly the cause is not due to greater toxicity.

D. geyeri and *D. subalpinum* are species representing the extreme conditions of growth, and yet the physical properties of the poisons obtained from them exhibit striking resemblances. *D. glaucescens*, the intermediate type, yields alkaloidal products markedly distinct from those of the other two species. The principal alkaloid is crystalline, optically active, has a structure much more complex than any other larkspur alkaloids and is present (crystalline form) in the plant at all stages of growth. Its physiological action closely resembles the low larkspur.

D. geyeri yields amorphous alkaloidal products only. In the early stages of growth, *D. subalpinum* yields one crystalline alkaloid, but it soon enters into combination with the plant acid to produce an amorphous product. The latter is very stable and requires saponification with alcoholic potash to resolve it into its constituents, acid and crystalline alkaloid. The toxicity of the amorphous complex is much greater than that of the simple base obtained from it. The low larkspur has the same general type of an amorphous alkaloid as found in the tall species. The crystalline alkaloid obtained by saponification is a new compound and differs from the other two bases in its physical and chemical properties. The pure alkaloid is very much less toxic than the amorphous complex from which it is derived.

The acid being non-toxic, it is interesting to observe that its combination with a slightly toxic base produces the intensely poisonous complex encountered in the two species. The alkaloids from *D. glaucescens* occur in the plant as salts. The corresponding amorphous complex is not formed in this plant.

SEASONAL VARIATION OF ALKALOIDS.

The determination of crude alkaloids in the larkspurs is attended with no difficulty if proper care is taken. It is necessary to use a mild alkali in breaking up the alkaloidal salts, otherwise decomposition follows and hence loss. The plant material was carefully selected, air dried, and reduced to a uniform powder. The moisture was determined on an aliquot portion, so that the percent of alkaloid has been computed on a bone-dry basis.

Figure 3 illustrates graphically the seasonal fluctuation. The three types follow the same general course, *D. geyeri* having the highest percent of any of the larkspurs. The seeds of this species were not obtainable. The pods of *D. subalpinum* and *D. glaucescens* contain far less alkaloid than the leaves and stems for the same period. As a rule the lowest alkaloidal content is reached when the plants are in full bloom. From this point on to the seeding stage, the percentage in the leaves and stems decreases somewhat while that in the seeds rapidly increase. An alkaloidal assay made on *D. subalpinum* at the time of seeding gave 0.25 percent of alkaloid in the leaves and stems, 0.25 percent in the pods, and 0.80 percent in the seeds.

The data indicate very clearly that the larkspurs are dangerous plants when immature, largely because of the quantity of alkaloid rather than its increased toxicity.

A Station bulletin is now being prepared giving the details obtained through a comprehensive chemical study of the larkspurs.

SECTION ON PRACTICAL PHARMACY AND DISPENSING, AMERICAN PHARMACEUTICAL ASSOCIATION.*

ABSTRACT OF THE MINUTES OF THE SESSIONS HELD IN CHICAGO, ILL., AUGUST 14
15 AND 16.

FIRST SESSION.

The first session of the Section on Practical Pharmacy and Dispensing of the Sixty-sixth Annual Convention, A. Ph. A., was called to order by Chairman J. C. Peacock, at 2:00 o'clock P.M., Wednesday, August 14. The Chairman read the following address:

Address of Chairman J. C. Peacock:

TO THE SECTION ON PRACTICAL PHARMACY AND DISPENSING, A. PH. A., CHICAGO MEETING,
1918:

In opening the sessions of the Section on Practical Pharmacy and Dispensing during such stirring times as these it becomes a patriotic duty to our cause to refer to those who, inspired by an earnest devotion to the same sixty-six years ago, came from the various parts of the United States and assembling in Philadelphia, the birthplace of our Nation, laid, as did its founders, the cornerstone of this Association, with a declaration for the right.

These men defined pharmacy to the Nation as a profession entrusted to the dispenser by both physician and community; they insisted that candor only as the true spirit of pharmacy be practiced, and they pledged their efforts to right the wrongs which pharmacy might correct. And there is no finer tribute which we can pay to their appreciation of pharmacy than to remind ourselves that they were in such close contact with the mortar and pestle, and in such immediate fellowship with the public that they saw in pharmacy the personal service to humanity both in the quality of their materials and in the art of dispensing them. They sought to improve both materials and art for the benefit of those they served. As individuals they were each and every one possessed of resource and determination; but they knew that they could learn from one another; they knew the value of united effort, and that through an association the good that each could do would be spread broadcast. And that is why they met. And if we read the deliberations of this first meeting we will be convinced that we have no higher, no more useful purpose to-day; for their object is still our object, and their spirit has always been and must remain the spirit of this Association.

PHARMACY AND THE PUBLIC.

While it is to-day our patriotic duty to pharmacy to refer to these zealous men it is equally incumbent upon us to declare that pharmacy must be further explained for a better comprehension of it by the people of our country, because we are asking our Government to give pharmacy the same consideration in war that it does in peace, for the benefit of the soldier who stakes his life in our defense. Our offer of the service of pharmacy to the soldier is not at all an unusual one, for when attired in the raiment of civil life he has it within easy access, and the Nation, as well as the State, has standardized this service and insists upon it for his and everybody's protection. But when the man is called to arms and takes upon himself the uniform he hopes to glorify; this very safeguard so provided and so insisted upon in civil life is denied him as though then unnecessary. This is neither consistency, justice nor respect for civil law; nor is it efficiency. That there are many pharmacists in the Army is known to all, and even in the face of the fact that they stand trained both as soldiers and pharmacists they are not specially selected to take care of and dispense the medicines needed by their comrades. Indeed, the scantiness with which they are called upon to do so is the result of sheer coincidence, while the neglect to use them for their special adaptation is so grossly apparent as to assume the proportions of a studied avoidance. This condition, fellow-members, makes it necessary to bring pharmacy into the lime-light of public attention, for we need the appreciation of the public to help us help the Nation's warfare by promoting the soldier's welfare. We must therefore advertise

* Papers with discussions thereon will be printed apart from Minutes.

this condition to the public as assiduously as our Nation is advertising its need for money to us in order to make a proper impress of this disregard of civil law which works an injustice on the soldier.

This is why pharmacy needs to be explained and demonstrated in daily practice to the end that the public shall understand it as a service of such serious import as to require legislative regulation, and not merely a word of eight letters appropriated some decades ago by the sign painter to make one drug store look different from another. And this advertising of pharmacy must be persisted in until every voter who has any interest whatsoever in the welfare of a soldier is not only disillusioned regarding any supposed present protection of the latter, but also shall demand that the civil rights of our defenders be not thus annulled.

Having thus devoted our attention to a patriotism demanded by our duty to the soldier and to pharmacy as well, we turn to thoughts pertaining to the progress of pharmacy and to conditions directly affecting the pharmacist.

THE U. S. PHARMACOPOEIA AND NATIONAL FORMULARY.

The best known accomplishment of American pharmacy that is in material form as evidence of its work and progress is the standardized materia medica which it has developed and which is embodied in the United States Pharmacopoeia and the National Formulary.

As our Association has Committees on both and of itself issues the National Formulary, and as these Committees report to this Section, it will not be out of place here to say a few words regarding these two legal standards as the evidence of the progress which pharmacy has made and is now making.

Sixty-six years ago the United States Pharmacopoeia was little more than a catalogue of titles and formulae. To-day it is an encyclopaedic volume, the study of which can not be too strongly recommended to practicing pharmacists; for it will prove a revelation to those who were graduated no less than ten years ago, and will awaken in every one a better idea of what is expected of pharmacists to-day. Nor can less be said of the National Formulary, which really is an "extra" U. S. Pharmacopoeia; and, because it is the work and property of our Association, we should feel both proud and duty bound to know its contents and its value.

THE JOURNAL AND THE YEAR BOOK.

And with the thought still in mind that pharmacy is improved in our trust by endeavoring to keep ourselves abreast of its progress, we want to refer to the JOURNAL of our Association as a potent factor in maintaining interest in pharmacy by recording its progress as a first consideration. This high-class periodical may be depended upon to bring each month a message of the true spirit of pharmacy with which it is inspired. Nor do we intend to pass mention here of the Year Book of our Association; a wonderful condensation of the pharmaceutical literature of the world; verily a volume of the "solid extract" of progress in pharmacy. The study of the JOURNAL and the Year Book will constitute what this Association has been so aptly termed—a post-graduate course in pharmacy. Our Association is fortunate indeed to be so ably represented to its members through the efforts of those who have these various duties in hand, and with unstinted enthusiasm may we display to the public these volumes of the progress of pharmacy as proof of the claims which we make for our art.

THE PRACTICE OF PHARMACY AND CONDUCT OF THE DRUG STORE.

The practice of pharmacy itself deserves a word of notice at our hands. The compounding of prescriptions remains as heretofore the best representative of pharmacy in our stores, for the reason that it is most closely associated with the work of the physician. It is the experience of those who have made the test that personal interest in the profession of pharmacy as attested by the care which is given to this department will produce the greatest assurance of one's ability and dependability through service to the public, and will build a prescription and drug trade among appreciative customers, the merits and stability of which will before long be recognized by physicians themselves, and not only command their respect but secure their encouragement and support.

Our Association has a committee on "Closer Affiliation of Pharmacists and Physicians," which might with advantage render a direct report to this Section, even if it did so in addition to the one intended for the General Session. The work of said committee is clearly related to the matters with which this Section has to do and I would, therefore, recommend that this thought be referred for consideration and action.

The scarcity of help is being severely felt by the pharmacist. Many are taxed to the limit of endurance by the combined effects of the work, care and hours of business. The time is propitious for the pharmacist to show his individuality by remembering that his hours to keep open store need not be influenced entirely by another's actions. An hour or a half hour taken from each end of the day will to that extent, at least, help conserve the health and strength of those in the store, as well as supply the encouragement of shorter hours to all. Indeed, one can not keep from seeing that the condition which confronts us makes for a permanently shorter working day for the drug store, as well as for many another vocation. These trying times will also put the loyalty of many to the test as between interest in pharmacy and side-lines. But though pharmacy may suffer because some give over their attention to side-lines and yet retain the name of pharmacy upon which to trade—a thing to be deplored—pharmacy will on the other hand, profit by such desertions to other interests as pass entirely out of its ranks.

Therefore, must pharmacy find within itself that temperament which will not allow it to be downcast because of such circumstances as have been mentioned?

WOMEN IN PHARMACY.

No sooner had enlistment and draft begun to show a depleting effect upon the labor needed for our large industries than women came forward to fill the places vacated. The advent of women into pharmacy some years back was a matter of much concern to those who have never quite understood that their mothers were women. But the doubts of these had already been dispelled before the present crisis arose to brush aside many a cherished notion as to women's work. Pharmacy in all its branches needs industry, care, neatness and devotion. It therefore offers an opportunity to those who have these requirements. As women can supply all of them, they are destined sooner or later, whether in war or peace, to find their way into pharmacy, and the exacting work of the prescription department will be their goal.

CONSERVATION IN PHARMACY.

Regarding the conservation of alcohol, glycerin and sugar by pharmacists we believe, that in so far as actual pharmacy is concerned, the best interest of the public can be served by pharmacists being allowed a sufficient supply of these materials for all pharmaceutical purposes. These actual needs will be found to be small in comparison with the annoyances, disappointments, and irregularities which must certainly arise if such supply is curtailed. There seems little reason why patient, physician or pharmacist should be exposed to the necessity for any other course. But improvement as a true economy may result from an interchange of views on the subject, therefore, a general discussion pertaining to War Emergency Formulæ has been scheduled for one of our sessions in order that the opinions and suggestions of all may have consideration.

THE ANTI-NARCOTIC LAW AND ITS ENFORCEMENT.

More than three years have elapsed since the enforcement of the Harrison Act, a sufficient time in which to observe its operation with regard to its effect on the practice of pharmacy. Few, if any, consider it perfect, but it has been accepted as a satisfactory first step in a worthy effort. It is the opinion of some that its existence will hasten the obsolescence of some of the compound opiates of the National Formulary, more especially those of such strength as require the special form of prescription. Such a result should encourage prescription writing, for if a physician decides upon the use of an opiate he will likely determine the dose and also state his preference as to what is to accompany it. It can scarcely be said that the operation of the Harrison Act has worked any hardship upon the pharmacist that has not been compensated for by an increased sense of appreciation, both by the public and the physician. And although a loose observance on the part of the pharmacist might at times apparently conciliate patient or physician, still, aside from every other consideration, self-respect demands a strict adherence, and confidence accrues only in him who will not intentionally deviate from the conditions imposed. We fail to see where any considerable volume of business of a desirable nature can be lost to the pharmacist either because of the law itself or through his strict adherence to its requirements. Nor can we conceive that any law which seeks to regulate the use of opiates with a view to restricting them to intelligent use will do other than help the practice of pharmacy.

It is unfortunate that we do not specifically have as inspectors under this law individuals who have had pharmaceutical training, that they may feel the spirit of the law, and by thus

appreciating the conditions under which it operates, help pharmacy toward what is possible in its improvement. Inspectors, without such training, may not comprehend the intent and technicalities and thus make of inspection a purely perfunctory service.

J. C. PEACOCK,
Chairman.

On motion of H. P. Hynson the address was referred to a committee of three, empowered to take up for consideration the different subjects touched upon by the Chairman, and submit them at the proper time in connection with other papers, or submit them independently if necessary, in some appropriate place in the program, so that the Chairman's views may be brought to the attention of the Association. Mr. Hynson also made the specific recommendation in support of the Chairman's suggestion that the Association be requested to send the report of the Special Committee on The Relationship of Physicians and Pharmacists to this Section.

The following papers were then read, discussed, and referred for publication:

"A Plea for a Closer Study of our Pharmaceutical Preparations in the Light of Criticism of the Medical Profession," by L. E. Sayre.

"A Proper College of Pharmacy Course that is of Interest to the Commercial Druggist," by Edward Spease.

"Spirit of Peppermint, U. S. P.," by E. F. Kelly.

"Therapeutical Standards, Past and Present," by Edward Kremers.

"Carbon Tetrachloride as a Solvent for Fats," by J. P. Snyder.

"On the Keeping Qualities of Dakin's Solution," by Irwin A. Becker.

"The Practical Pharmacist from the Manufacturer's Standpoint," by R. C. White.

"Note on Tincture of Cinchona Compound," by F. W. Nitardy. The paper was read by the Secretary.

The first session of the Section on Practical Pharmacy was then adjourned.

SECOND SESSION.

The second session of the Section on Practical Pharmacy and Dispensing was called to order by the Chairman at 2:30 P.M., Thursday, August 15.

Mrs. J. M. Kenaston read a paper entitled "The Pharmacist's Objectives." It was referred for publication after discussion.

REPORT OF THE COMMITTEE ON THE CHAIRMAN'S ADDRESS

SECTION ON PRACTICAL PHARMACY AND DISPENSING.

Your Committee is seriously impressed by the most appropriate and comprehensive character of Chairman Peacock's address which shows creditable familiarity with actual conditions in the practice of pharmacy and offers practical and promising suggestions that will, undoubtedly, be helpful to those seeking a reasonable advancement of pharmacy and to those endeavoring to correct current abuses; the address is commended to both classes of reformers for serious study. It is also believed by this Committee that it would be wise for the schools of pharmacy to encourage the study of this and similar discussions by students of pharmacy, that they will be better able to confront conditions they will meet in their coming practice.

Especial attention is called to the Chairman's remarks on a number of pertinent subjects, and the suggestion is made that a careful general discussion of these be had by this section if time can be found for doing so. Such a discussion would probably result in finding a mode of handling the questions that would result happily to all concerned.

The subjects suggested in the Chairman's Address are as follows:

"The higher inspiration for pharmaceutical action."

"A better appreciation of true pharmaceutical practice by the public and, especially, by Government officials and by State and National legislators."

"Coöperation between physicians and pharmacists."

"A fairer understanding by the laity of the creditable work done by pharmacists in the making of our National Standards for medicines."

"Shorter hours and the conservation of help in pharmacy."

"The enforcement of the National Narcotic law and the character of inspectors required."

Respectfully submitted,

HENRY P. HYNSON,

(Signed) CURT P. WIMMER,

L. E. SAYRE.

The report was accepted and the recommendations contained therein were endorsed, and the Secretary was instructed to send a copy of this report to the succeeding officers of the Section.

W. L. Scoville then presented the report of the Committee on National Formulary. This report was referred to the Council. (See Committee Reports.)

The chairmen of the Committees on U. S. Pharmacopoeia and A. Ph. A. Recipe Book were unable to be present, and no reports were submitted.

The following papers were read:

"Pharmaceutical War Babies," by C. P. Wimmer.

"Percentage Solutions," by H. L. Thompson.

"Analysis of Milk of Magnesia," by R. W. Terry.

The Secretary then read a note from Professor J. U. Lloyd, who was unable to remain for this session. It follows:

"TO THE SECTION ON PRACTICAL PHARMACY AND DISPENSING:

My paper on 'Solvents in Pharmacy' continues the subject introduced last year. The newly introduced feature comprises descriptions of the meniscus that forms between separated liquids, the same being portrayed by illustrations.

This paper is not subject to condensation, is too precise concerning details to be read at length before the Section, and is therefore presented by title.

(Signed) JOHN URI LLOYD."

In order to open a discussion on the subject of War Emergency Formulas, a paper by Bertha Mueller, entitled "Notes and Suggestions on the Use of Glycerin in Official Preparations," was read by the Chairman.

A paper entitled "Continuous Percolation under Reduced Pressure," by J. G. Beard, was read by C. M. Snow. The following papers were read by title:

"The Druggist as a Public Notary," by Emil Roller.

"Laboratory Notes," by T. D. McElhenie.

"Some Views on Practical Pharmacy," by E. T. Hahn.

"A Combination Prescription Check, Cash Slip, Charge Slip and Working Record," by C. Osseward.

"Some Pharmaceutical Notes," by W. R. White.

Nominations for officers for the ensuing year were made, after which the second session was adjourned.

THIRD SESSION.

The third session was called to order by Chairman J. C. Peacock at 9 o'clock A.M., Friday, August 16.

The first paper was entitled "The Preparation of Tinctures by the Dilution of Fluidextracts." It was presented by Edward Davy. Then followed a "Prescription Clinic," by Charles H. LaWall. Both the paper and the Clinic elicited much discussion.

The Secretary then read a paper by F. L. Stone, entitled "Can a Retail Druggist Continue as a Manufacturer?" The following papers were then presented by title:

"A Utilization which Conserves," by J. C. Peacock.

"Lime, Lime Water and Lime Water Tablets," by R. W. Terry.

"The Use of Logarithms and Antilogarithms in Pharmaceutical Assaying," by H. L. Thompson.

"The N. F. Petroxolins and Paralle Preparations," by H. A. Langenhan and G. J. Noll.

"Sterilized Distilled Water," by E. F. Cook and L. Gershenfeld.

"An Experiment on Compound Tincture of Benzoin," by J. C. and B. L. DeG. Peacock.

"Absence of Inspection under the Harrison Act," by J. C. Peacock.

This concluded the papers, all of which were referred for publication. Further nominations were called for, and after balloting on the names of those presented as candidates as associate members on the Committee, the officers for the ensuing year were reported to be as follows:

Chairman, R. W. Terry, Groveport, Ohio.

Secretary, Edward Davy, Columbus, Ohio.

Associate Members, William Gray and Irwin A. Becker, both of Chicago, Ill.

The new officers were installed. The retiring Chairman thanked his colleagues for their help, and the third session was adjourned by the newly-elected Chairman, Robert W. Terry.

CONTINUOUS PERCOLATION UNDER REDUCED PRESSURE— REPORT No. 1.*

BY J. G. BEARD.

This will be a preliminary report on the progress I have made to date on a new (or at least modified) process for percolating fluidextracts.

This process consists essentially of extracting drugs in the preparation of fluidextracts through the use of a specially designed percolator that keeps the drug constantly in contact with fresh menstruum but not new menstruum. It may be thought of as a modified form of Soxhlet extraction.

The apparatus involved consists of four parts: A generator which is a glass distilling flask having an upright side-arm tube to permit introduction of a thermometer and a mercury gauge for measuring pressure; a percolator shaped like the Oldberg form but having a lateral tube opening into the percolator above the top of the drug and also entering below the lower portion of the drug, the object being to allow vapors from the generator to pass around the powder to be extracted and reach the condenser; a double Soxhlet condenser to be used as in reflux operations; and a tube from the top of the condenser leading to a vacuum pump. All of these parts are connected together perpendicularly by means of tightly fitting rubber stoppers.

The process is conducted as follows:

The drug from which the fluidextract is to be made is macerated for sixty hours with enough menstruum to render it distinctly and uniformly damp. At the expiration of this time the drug is placed in the percolator, which has been provided with a pledget of cotton, in a succession of layers, moderately packing the drug after the addition of each layer. An amount of menstruum exactly equalling the volume of fluidextract to be made is placed in the generating flask. The parts of the apparatus are then tightly connected together by means of rubber stoppers. Low heat is applied to the generating flask from a constant level water bath, and when the thermometer registers a temperature of approximately 30° C. the vacuum pump is started. The heat and suction are carefully continued until such a pressure and temperature are obtained

* Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918.

in the apparatus as will enable the menstruum to boil between 35–40° C. With the source of heat remaining a constant, the tube leading to the vacuum pump is then tightly closed with a screw pinch-cock to seal the apparatus. The menstruum is rapidly vaporized on account of the reduced pressure and passes upward. When the vapors encounter the neck of the percolator they take the path of least resistance through the side-arm tube and thus pass around and out of contact with the drug. These vapors quickly reach the reflux condenser, are cooled, liquefied, and the condensed cold fluid drops straight down upon the drug where it acts precisely as in ordinary percolation, extracting the soluble principles in passing downward. When the percolate thus formed completes its passage through the drug it drops into the generating flask. The portion constituting the solvent is immediately vaporized again as fresh menstruum, and as such is capable of exercising the same solvent effects as on the first trip through the apparatus. The drug as a consequence is constantly subjected to the action of fresh solvent until finally all soluble matter is extracted and the process is completed.

When the operator believes that this point has been reached, he disconnects the generating flask and tests a small portion of the percolate as it leaves the neck of the percolator with an appropriate reagent, for example in the case of alkaloidal drugs, with Mayer's reagent. If the test is negative nothing further need be done beyond collecting the last drops of percolate and adding to the portion in the flask. If the test shows the presence of active principles the apparatus must be reconnected and the process continued for such time as in the judgment of the operator will have allowed the menstruum to complete the extraction. If the process has been carefully conducted the final volume of fluidextract will equal in mls the number of grammes of drug taken. Whether the finished product will be one hundred percent strong depends altogether upon the strength of the powdered drug taken. In the experiments so far conducted by the author the fluidextracts made by this process have represented in all cases a very close approximation in strength to that of the drug before extraction, and in some cases have tallied to two points to the right of the decimal.

In the case of alkaloidal drugs for which appropriate assays are prescribed by the Pharmacopoeia, the plan of the ninth revision can be followed and the fluidextract tested and brought to standard as well by this process as by the one official.

Up to the time this report was prepared the fluidextracts made were only

Apparatus for Continuous Percolation under Reduced Pressure

from drugs the official menstrua of which contained only alcohol, or alcohol and water. In the case of hydroalcoholic menstrua the water element has never been present in a greater ratio than one to three. There seems no apparent reason, however, why, for example, a glycerin, alcohol and water menstruum might not be used provided the first portion containing the non-volatile glycerin were added to the drug as in Type Process B.

A few fluidextracts like that of aconite are debarred from this process, since even the low heat of 35° C. would injure the active principles, but their number is very small. It should be borne in mind that in this process fluidextracts are made, as a result of reduced pressure, at a temperature no higher than normal blood heat.

Sufficient time has not elapsed to determine the keeping qualities of the fluidextracts made by Continuous Percolation under Reduced Pressure. The oldest preparation so made is from *nux vomica*—eight months old; however, in each case a fluidextract of the same drug was made by the U. S. P. method and reserved as a check. Both kinds of fluidextracts show the same degree of slight precipitation after standing several months.

The advantages which it is believed this process offers are threefold: (1) A saving of menstruum, the only loss being that amount retained by the drug after pressing. (2) Economy of time—after the process is started, the operator's time can be given to other work. (3) If the method be proved as practicable as incomplete experimentation leads one to believe, fluidextracts can be made at less cost than they can be purchased.

The fluidextracts which have been satisfactorily made by the above process are those of *nux vomica*, *hyoseyamus*, *cannabis*, *guarana*, *pilocarpus*, *podophyllum*, *buchu*, *gentian*, *spigelia*, *staphisagria*.

PHARMACY DEPARTMENT,
UNIVERSITY OF NORTH CAROLINA.

CARBON TETRACHLORIDE AS A SOLVENT FOR FATS.*

BY J. P. SNYDER.

The ninth edition of the pharmacopoeia has in the case of certain drugs which contain considerable quantities of fats and oils directed that these be removed by treating them with purified petroleum benzene. There is a decided improvement in the finished preparations over those of the U. S. P. VIII, which is particularly noticeable in Tincture of *Strophanthus* and Fluidextract of *Colehicium Seed*. Formerly, these preparations, when made according to the previous official formula presented a rather unsightly appearance and precipitated badly. The use of a solvent for the fats is evidently the logical method for the removal of these inert substances as our experience has been that it is preferable to attempting to freeze out the fats in the finished preparation.

Petroleum benzene, however, is open to serious objections: Firstly, as it is extremely difficult to drive off completely its peculiar odor which may be easily detected in the finished preparation.

* Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago, meeting, 1918.

Secondly, the danger connected with its use: We are all familiar with this liquid and know how highly inflammable it is and while the danger may not be great in treating 100 or 1000 grammes of the drug with this liquid, it often becomes necessary to manufacture 10, 50 or 100 gallons, or more, in which case large quantities of the drug impregnated with this highly inflammable substance must be spread out to dry. While this operation is taking place one cannot rest easily when he realizes that it only requires a spark to start a serious conflagration.

Thirdly, its use is not economical: Owing to its properties previously described, no one would care to take the chance of recovering it by distilling it over a naked flame and while it may be distilled in a steam jacketed pan, the disagreeable odor remains in the pan for a considerable length of time and may contaminate other batches and consequently, if thrown away, it represents a clear loss.

The above shortcomings of petroleum benzene led us to endeavor to find a liquid that would not be open to these objections and which would remove the oily ingredients from the drugs. After considering the list of available substances, we finally decided to try carbon tetrachloride. This liquid readily exhausts completely the fats from such drugs as strophanthus and colchicum seed, while the active therapeutic ingredients are not disturbed, as is shown by subsequent physiological and chemical tests. Upon exposing the drug to the air and sunlight, the carbon tetrachloride may be readily and completely dispelled and there is no odor of this liquid in the finished product. It is absolutely impossible to ignite it, in fact, it is the principal ingredient of several patented fire extinguishers. No danger is connected with distilling it, as we have oftentimes distilled small amounts over a naked flame in our laboratory, as well as treating large quantities in our steam stills without contaminating other batches.

In fact, carbon tetrachloride possesses all the properties of petroleum benzene as far as its use as a solvent is concerned, and it is free from the objections and dangers of the latter.

ANALYTICAL LABORATORIES,
NORWICH PHARMACAL COMPANY.

PHARMACEUTICAL WAR BABIES.*

BY CURT P. WIMMER.

The term "War Baby" has been jocularly applied to the various creations, both abstract and concrete, of the world war. Popularly created nomenclature is invariably significant if not correct, and I use the term here to mean the newer pharmaceutical preparations created by the war. Truly, they are war babies, for only time can tell whether they will live and become useful members of our formularies or whether they will disappear.

It is the object of this paper to present a brief review of a number of the more important pharmaceutical preparations which have come into use during the last few years. All of these preparations, evolved through the exigencies of war, are used to combat sepsis, and to heal wounds or burns.

* Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918.

Inasmuch as infected wounds constitute by far the largest number of cases requiring treatment, it is but natural that physicians from the very beginning of the war sought the ideal antiseptic. The first one to become widely used was iodine. This was supplied to the troops put up in ampuls and millions of them have been used.

English physicians tried out a variety of substances. Sir Rickman Godlee treated wounds with pure carbolic acid, following the treatment with applications of a cyanide dressing. G. Lenthal Chetle used a combination of mercuric chloride and carbolic acid; another physician recommended the use of mercuric chloride and serum. Others advocated the use of such substances as garlic juice, urea, turpentine, liquid paraffin, salicylic acid, etc.

To Sir Almroth Wright must be given credit for suggesting the irrigation of wounds and the insertion of antiseptic tablets into wounds. Then came "Eupad," a mixture of equal parts of bleaching powder and boric acid, and "Eusol," consisting of 12.50 Gm. each of bleaching powder and boric acid mixed with 1 liter of water. From this Dakin proposed his original formula, as follows:

Sodium carbonate, dry, 140.00 Gm. Dissolve this in 10 liters of tap water and add 200 Gm. of chlorinated lime of good quality. This is shaken and set aside; then the liquid is syphoned off and filtered through cotton. Now add 40.0 Gm. boric acid and allow to dissolve. The solution is now ready for use. This solution was to contain about 0.50 percent of hypochlorous acid. Carrell, who used this solution in the irrigation of wounds, soon found that it was of importance to have this solution neither too alkaline nor of a too high hypochlorous acid content and placed it by proper modifications upon an exact basis by requiring titration to determine its strength. The details of the preparation and analysis of the Carrel-Dakin solution have been treated in such exhaustive manner in publications of late that I will not touch upon them here. Suffice it to say that of all the pharmaceutical war babies, this is the one most likely to survive.

A preparation which is now largely used and which is distinctly a creation of the war is the so-called "Bipp Paste," a bismuth subnitrate, iodoform-paraffin combination. Its formula is as follows:

| | |
|----------------------|------------------------|
| Iodoform | 8 ounces |
| Bismuth Subnitrate.. | 8 ounces |
| Liquid Paraffin..... | q. s. to make a paste. |

After cleansing the wound it is completely filled with this paste and dressed with sterile gauze. It is not necessary to change the dressing unless pain is experienced by the patient. It is of course very important that this paste be absolutely free from gritty material.

It has been found that the crystallized iodoform, reduced to a very fine powder, is less apt to produce iodoformism than the granular form. If iodoformism sets in, potassium bicarbonate is given in 15-grain doses to combat it. A metallic spatula must not be used in the preparation of this paste.

Chloramine T (sodium para-toluene sulphochloramide) and Dichloramine T (toluene parasulphodichloramine) next engage our attention. Of these two antiseptics the latter is more extensively used because of its solubility in eucalyptol, which solution can then be diluted with paraffin oil. The antiseptic action of this substance depends upon the fact that chlorine is slowly given off, which exerts

the specific effect. In making solutions of Dichloramine T it is preferable to use chlorinated oils to prevent or retard the decomposition of the medicinal ingredient. A nasal spray, for example, may be prepared by dissolving Dichloramine T 0.20 Gm. in 2 Cc. of chlorinated eucalyptol and adding 8 Cc. of liquid paraffin. A 10 percent stock solution of Dichloramine T in chlorinated eucalyptol will keep for about one month. Quite recently Dakin and Dunham (B. M. J.) announced that they had discovered a new solvent for dichloramine by chlorinating hard paraffin. This process is, in short, the following: Paraffin melting at $50^{\circ}\text{C}.$, or higher, is selected and placed into two flasks connected in series. It is heated to $120^{\circ}\text{C}.$ and a rapid current of Cl gas is passed through until the paraffin is saturated or until the contents of the flasks have increased 45-55 percent in weight. The oily liquid formed is shaken with 5 percent of its weight of sodium carbonate and filtered through a dry fluted paper. This chlorinated paraffin is a clear, viscid liquid of a yellow color and slightly heavier than water. The authors propose to call this liquid Chlorcosane. It is capable of dissolving $8\frac{1}{2}$ to 10 percent of Dichloramine T. For wound treatment a $7\frac{1}{2}$ percent solution is sufficiently strong. For spraying it may be diluted with 10 percent carbon tetrachloride.

Dichloramine T and its preparations have been fully described in our literature. At the recent meeting of The New Jersey Pharmaceutical Association, Prof. E. Fullerton Cook read an excellent paper on the subject to which I refer those desiring more detailed information.

In the early part of the war there was announced a French proprietary remedy for the treatment of burns. It was called "Ambrine." This remedy proved so successful that it commanded general attention. It was wax-like and when melted and applied to wounds or burns formed an air-tight covering under which the wound healed rapidly. Experiments were made to determine to what particular property or ingredient the remarkable healing qualities of the preparation were due. It was finally found that when hard paraffin was heated to $130^{\circ}\text{C}.$ by the aid of superheated steam the resulting product has a somewhat lower melting point than the paraffin originally used and that it had properties similar to those of ambrine. It is now universally accepted that ambrine owes its efficacy to the hard paraffin and not to any resin or oil of amber which are claimed to be present. Further investigations showed that it was essential to use a paraffin of suitable melting point and ductility. In the *Journal of the American Medical Association*, 1917, 69, 1525, are outlined the requirements for paraffin for film treatment. The paraffin must be more pliable and ductile than the U. S. P. kind. It must be liquid at $50^{\circ}\text{C}.$, pliable at or below $28^{\circ}\text{C}.$ and ductile at or below $31^{\circ}\text{C}.$ It should readily adhere to the skin but permit of ready detachment from it. From these considerations has resulted the so-called paraffin treatment of wounds, which is, briefly, the following: The burn is first washed with clean water and dried, a layer of melted paraffin is painted on and covered with a layer of cotton; a second coat of paraffin is now applied and the whole covered with wool and a bandage. The dressing must be changed every day.

A number of modifications have been proposed. One is to use liquid paraffin for the first coat on the wound. This tends to make the application practically painless, for it was found that hard melted paraffin applied to a burn occasioned considerable pain. Another modification consists in the addition of

certain substances to the paraffin to enhance its action. Sollman recommends the addition of $\frac{1}{2}$ percent of asphalt, or of 10 percent of cacao butter or yellow vaseline, together with antiseptics such as resorein and eucalyptol. Hull, in the *British Medical Journal*, Dec. 15, '17, claims that it is best to use an antiseptic before applying the paraffin film. He recommends the use of Acriflavine, as a 1:1000 solution. The use of aniline dyes as antiseptics has increased of late, and their value as such is under investigation. We owe the suggestion that aniline dyes may be valuable antiseptics to Ehrlich, the inventor of Salvarsan. Flavine, or diamino-methyl-acridinium chloride, was originally prepared by Benda, a co-worker of Ehrlich. Browning and Gilmore called the attention of the profession to the powerful antiseptic action of this substance. The following dyes are in use as antiseptics: Brilliant green, Flavine, Acriflavine, Proflavine, Scarlet-Red. The question as to the real effectiveness of these dyes is still an open one. Extensive biological experiments are now in progress at the Middlesex Hospital, London, to determine their true value. From results announced it appears that Brilliant Green is about 3-4 times stronger than mercuric chloride, and that it is capable of killing organisms in as high a dilution as 1:30,000. Some of the formulas suggested by Lieutenant Colonel Hull are as follows:

No. 10 Red.

| | |
|------------------------|--------|
| Scarlet-Red..... | 0.20% |
| Oil of Eucalyptus..... | 2.00% |
| Olive Oil..... | 5.00% |
| Hydrous Woolfat..... | 4.00% |
| Paraffin, soft..... | 21.00% |
| Paraffin, hard..... | 67.80% |

No. 13 Flavine Wax.

| | |
|------------------------|--------|
| Flavine..... | 0.20% |
| Oil of Eucalyptus..... | 2.00% |
| Olive Oil..... | 5.00% |
| Hydrous Woolfat..... | 4.00% |
| Paraffin, soft..... | 21.00% |
| Paraffin, hard..... | 67.80% |

No. 12.

| | |
|------------------------|--------|
| Brilliant Green..... | 0.05% |
| Oil of Eucalyptus..... | 2.00% |
| Olive Oil..... | 5.00% |
| Hydrous Woolfat..... | 4.00% |
| Paraffin, soft..... | 21.00% |
| Paraffin, hard..... | 67.95% |

No. 14.

| | |
|------------------------|--------|
| Dichloramine T..... | 0.20% |
| Oil of Eucalyptus..... | 2.00% |
| Olive Oil..... | 5.00% |
| Paraffin, soft..... | 25.00% |
| Paraffin, hard..... | 67.80% |

The dye is rubbed with the hydrous woolfat until thoroughly mixed, using about $\frac{1}{2}$ ounce of water to assist the solution of the dye. Melt the hard paraffin, add the liquid paraffin and the olive oil. When the temperature of the mixture is at 50° C., add the lanolin-dye paste, stirring until thoroughly mixed. Lastly add the oil of eucalyptus and stir until cold.

We have reviewed, briefly, Dakin Solution, Bipp Paste, Dichloramine, Ambrine-like preparations, aniline dyes as antiseptics. All have come into extensive use during the war. Let us hope that at least some of them will prove to be of inestimable value to man. Let us also call attention to the fact that much research work remains still to be done on these preparations, especially along pharmaceutical lines. Physicians and chemists have taken the lead in creating and applying these new substances. Will the pharmacist rise to the occasion and endeavor to present them to the medical profession in the form of new and elegant and compatible pharmaceuticals? It is my hope and expectation that he will do so!

A REPORT ON DAKIN'S SOLUTION.*

BY IRWIN A. BECKER.

It was the original intention to save a portion of a number of 10-liter lots of Dakin's solution, Daufresne formula, so as to represent, fairly, a period of six months; then to determine to what extent deterioration had taken place.

The results here presented cover a longer period on these same samples, and include several forms of hypochlorite solution for comparison.

Dakin's solution, after the boric acid formula, in 10-liter quantities, was first made by me in August, 1916, following directions carefully, and again in November, 1916.

These solutions were not assayed at the time of making, nor during their using, but samples of the last portions of each were set aside in well-filled, corked, 8-oz. bottles, in a dark cupboard of uniform medium temperature.

The same storing conditions obtained for all samples reported.

Being advised that it was intended to use Dakin's Solution freely, and that it should be made after the Daufresne technique, 10-liter lots were made every 8 to 14 days.

The chlorinated lime was assayed each time before using, and the quantities calculated on the basis of the assay. Ordinary crystal sodium carbonate was used instead of the anhydrous, in the proportion of 2.7 to 1, this factor being calculated from the molecular weights of these salts, respectively.

The chlorinated lime assay was made by a modified form of the method illustrated in Coblentz's Volumetric Analysis, First Edition, page 137-138, under "Chlorinated Lime."

The modifications consisting of using two mils glacial acetic acid instead of hydrochloric acid, and macerating the lime at least two hours, if possible, in a closely stoppered flask, then straining through cotton, the number of mils N/10 thiosulphate consumed equalling the number of percents of available chlorine.

The finished product was assayed in each case and the assay recorded in mils of N/10 thiosulphate V. S. At first, the assays of the finished product were stated in terms of available chlorine, but all have been converted into terms of sodium hypochlorite. All assays were made with the same apparatus, such as burettes, graduates, flasks, etc.

One hundred mils Dakin's Solution containing from 0.45 Gm. to 0.50 Gm. hypochlorite require from 120.8 to 134.3 mils N/10 sodium thiosulphate V. S.; 10 mils require from 12.08 to 13.43 mils volumetric thiosulphate. For convenience 10 mils were taken for assay excepting in one instance, when 5 mils only were used, and of the concentrated solutions 1 mil was used and the result multiplied by 10 to compare with Dakin's Solution.

The details of the assays on the various samples and remarks on modifying conditions are set forth in the following table:

* Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918.

| Sample, and date of manufacture. | Date of, and original assay. | Assay 7/5/17. | Loss percent. | Assay 7/18. | Loss percent from original | Remarks |
|----------------------------------------|---------------------------------|------------------|------------------|----------------|-------------------------------|----------------------------------------------------------------------------------------------------|
| A ¹ | ... | ... | .. | 0.444 | .. | Boric acid formula, slightly alkaline to phenol- phthalein. |
| A ² | 0.706 | 0.614 | 13.4% | 0.433 | 39.6% | Boric acid formula, cork good, bleached. |
| 11/16 | 1/5/17 | | | | | |
| A ³ | 0.54 | ... | .. | 0.349 | 36.4% | Boric acid formula, diluted to be about 0.5%, amber g. s. b. |
| 11/16 | 1/5/17 | | | | | |
| B..... | 0.515 | 0.49 | 5.6% | 0.495 | 21.4% | Dakin's, cork good, bleached. |
| 1/5/17 | 1/5/17 | | | | | |
| C..... | 0.506 | 0.428 | 15.4% | 0.273 | 46.0% | Dakin's, cork porous and decidedly bleached. |
| 3/12/17 | 3/12/17 | | | | | |
| D..... | 0.513 | 0.465 | 9.4% | 0.322 | 37.0% | Dakin's, cork very poor, bleached. |
| 3/22/17 | 3/22/17 | | | | | |
| E..... | 0.462 | 0.462 | 0.0% | (Sample lost) | | Dakin's, 10 days, hot weather. No loss. |
| 6/25/17 | 6/25/17 | | | | | |
| F..... | ... | 0.53 | (Sample lost) | | | Dakin's, fresh lot. |
| 7/5/17 | | | | | | |
| G ¹ | ... | .. | .. | 0.348×10 | 55% | Commercial brand, assay as per label, 7.7% NaOCl. |
| (Rec'd 3/16) | | | | | | |
| G ² | ... | ... | .. | 0.500×10 | | Commercial brand, received a few days before assay- ing, assay as per label, 4.05% NaOCl. |
| (Rec'd 7/18) | | | | | | |

Ordinary care only was exercised with stoppers, as some corks were better than others. It will be seen from the table that where the sample was well stoppered it did not fall below the lower limit of variation permissible, in six months.

The commercial, so-called stabilized, product lost strength, apparently, at about the same rate as Dakin's Solution, Daufresne formula.

THE USE OF LOGARITHMS AND ANTILOGARITHMS IN PHARMACEUTICAL ASSAYING.*

BY H. L. THOMPSON.

It has been my experience in teaching the subject of pharmaceutical assaying that one of the most difficult, tedious and nerve-racking parts of it is the performance of the mathematical calculations involved. As a result, I have attempted to instruct my students in the use of logarithms and antilogarithms, and after six years of such performance, there have resulted the following facts:

1st. As far as accuracy, the results obtained by using logarithms and antilogarithms is 0.01%, and that is considerably beyond the average accuracy in practice.

2nd. The time and labor saved by the use of logarithms and antilogarithms is about one-tenth or less than that used by the method of ratio and proportion, and the multiplication and long division of three or four decimal figures out to the third or fourth decimal place as required in determining strengths of drugs, chemicals and their preparations.

* Contributed to Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918

3rd. The continual use of logarithms and antilogarithms has brought forth five general formulas, two for standardizing volumetric solutions, two for volumetric assay, and one for gravimetric and electrolytic assay.

Just what are logarithms and antilogarithms can not be explained in a better way than to first define a logarithm and an antilogarithm, show a logarithm table and an antilogarithm table, and then explain their use.

(If one is fully acquainted with the use of logarithms and antilogarithms, the following paragraphs may be omitted, and the use of the general standardization formulas and general assay formulas may be considered. See paragraph, Explanation of terms used in the formulas.)

LOGARITHM OF A NUMBER.

Let "a" be a certain fixed number, "n" any other number, and let "x" represent the exponent of "a" required to produce "n." Then "x" is the logarithm of "n" to the base "a."

As equations: if $a^x = n$; then $x = \log_a n$.

Hereafter are given some very simple tables of logarithms.

| No. | Logarithm Base = 2. | n. | $\log_{10} n$. | n | $\log_{10} n$ |
|------|------------------------|---------|-----------------|---|---------------|
| 1/16 | -4 | 0.0001 | -4 | 1 | 0.0000 |
| 1/8 | -3 | 0.001 | -3 | 2 | 0.3010 |
| 1/4 | -2 | 0.01 | -2 | 3 | 0.4771 |
| 1/2 | -1 | 0.1 | -1 | 4 | 0.6021 |
| 1 | 0 | 1.0 | 0 | 5 | 0.6990 |
| 2 | 1 | 10.0 | 1 | 6 | 0.7782 |
| 4 | 2 | 100.0 | 2 | 7 | 0.8451 |
| 8 | 3 | 1000.0 | 3 | 8 | 0.9031 |
| 16 | 4 | 10000.0 | 4 | 9 | 0.9542 |

LAWS OF OPERATIONS WITH LOGARITHMS.

Since a logarithm is an exponent, the laws of operation for logarithms are the same as those for exponents.

Let "x" be the logarithm of "m," "y" that of "n," the base being "a."

Then $\log_a m = x$; or $a^x = m$;

$\log_a n = y$; or $a^y = n$.

Hence $mn = a^{x+y}$ and $m/n = a^{x-y}$;

or $\log_a mn = x + y = \log_a m + \log_a n$;

and $\log_a m/n = x - y = \log_a m - \log_a n$.

We have therefore the rules:

I. The logarithm of a product equals the sum of the logarithm of the factors.

II. The logarithm of a fraction equals the logarithm of the numerator minus the logarithm of the denominator.

Also, if as before,

$\log_a m = x$, so that $m = a^x$;

then, if p and q be any real numbers,

$m^p = a^{px}$ and $m/q = a^{x/q}$.

Hence $\log_a m^p = px = p \log_a m$;

and $\log_a m = x/q = 1/q \log_a m$.

There are therefore two additional rules:

III. The logarithm of any power of a number equals the exponent of the power times the logarithm of the number.

IV. The logarithm of any root of number equals the logarithms of the number divided by the index of the root.

(Rule III contains Rule IV, since the power in question may be fractional.)

The following facts regarding logarithms should also be carefully noted:

(a) In any system the logarithm of the base is 1; for $a^1 = a$. Therefore $\log_a a = 1$.

(b) In any system the logarithm of 1 is 0; for $a^0 = 1$. Therefore $\log_a 1 = 0$.

(c) In any system whose base is greater than unity, the logarithm of 0 is $-\infty$. For if $a^x = m$, and $a > 1$, then if x is a large negative number m will be small. As x increases indefinitely, always being negative, m approaches zero. That is, $a^{-\infty} = 0$; if $a > 1$. Therefore $\log_a 0 = -\infty$.

(d) A negative number has no (real) logarithm, the base being positive.

(e) As a number varies from 0 to $+\infty$, its logarithm varies from $-\infty$ to $+\infty$, the base being greater than 1.

When the number is greater than 1, its logarithm is positive, and when the number is less than 1, its logarithm is negative.

A photo of Logarithms of Numbers and Antilogarithms accompanies this article.

EXPLANATION OF THE TABLES AND THEIR USE.

Logarithms of Numbers.—This table gives the decimal part, or mantissa, of the logarithms of every positive number containing not more than three significant figures. The mantissas of the logarithms of numbers containing more than three significant figures are to be obtained by interpolation or the use of the proportional parts. The integral part, or characteristics, of the logarithm must be supplied by the computer, according to the position of the decimal point in the number.

RULES FOR CHARACTERISTICS.

(a) When a number has " n " significant figures to the left of the decimal point, the characteristic of its logarithm is $n - 1$.

(b) When the number is a decimal with " n " ciphers between the decimal point and the first digit which is not zero, the characteristic of its logarithm is $9 - n$, and -10 must be supplied to complete the logarithm.

The reason for these rules will become evident when we consider an example.

Find $\log 631$. In the table find 63 in the left hand column and run across the page horizontally to the column headed one. There we find that the mantissa of $\log 631 = 0.8000$.

Now 631 lies between 100 and 1000, *i. e.*, between 10^2 and 10^3 .

Hence, by definition of a logarithm, $\log 631$ must lie between 2 and 3.

Therefore the characteristic is 2, and $\log 631 = 2.8000$.

This, of course, is not the exact logarithm of 631, but only its value to four decimal places.

Writing the last equation in exponential form, we have

$$631 = 10^{2.8000}.$$

Multiplying both sides by 10, $6310 = 10 \times 10^{2.8000} = 10^{3.8000}$

Hence, $\log 6310 = 3.8000$.

Multiplying again by 10, $63100 = 10 \times 10^{3.8000} = 10^{4.8000}$. Hence $\log 63100 = 4.8000$. Therefore, when a number is multiplied by 10, the characteristic of its logarithm is increased by 1; the mantissa remains unchanged.

Dividing the above equations successively by 10, we obtain

$$\begin{aligned} 63.1 &= 10^{2.8000} \div 10 = 10^{1.8000} \\ 6.31 &= 10^{1.8000} \div 10 = 10^{0.8000} \\ 0.631 &= 10^{0.8000} \div 10 = 10^{0.8000-1} \\ 0.0631 &= 10^{0.8000-1} \div 10 = 10^{0.8000-2} \\ 0.00631 &= 10^{0.8000-2} \div 10 = 10^{0.8000-3} \text{ and so on.} \end{aligned}$$

As logarithmic equations these are:

$$\begin{aligned} \log 63.1 &= 1.8000 \\ 6.31 &= 0.8000 \\ 0.631 &= 0.8000 - 1 = 9.8000 - 10 \\ 0.0631 &= 0.8000 - 2 = 8.8000 - 10 \\ 0.00631 &= 0.8000 - 3 = 7.8000 - 10, \text{ and so on.} \end{aligned}$$

The second form of the last three equations is used for convenience in computations; it is in accordance with Rule *b*.

LOGARITHMS OF NUMBERS

| N | PROPORTIONAL PARTS | | | | | | | | | |

| 86 | 0860 | 0861 | 0862 | 0863 | 0864 | 0865 | 0866 | 0867 | 0868 | 0869 |
| 87 | 0870 | 0871 | 0872 | 0873 | 0874 | 0875 | 0876 | 0877 | 0878 | 0879 |
| 88 | 0880 | 0881 | 0882 | 0883 | 0884 | 0885 | 0886 | 0887 | 0888 | 0889 |
| 89 | 0890 | 0891 | 0892 | 0893 | 0894 | 0895 | 0896 | 0897 | 0898 | 0899 |
| 90 | 0900 | 0901 | 0902 | 0903 | 0904 | 0905 | 0906 | 0907 | 0908 | 0909 |
| 91 | 0910 | 0911 | 0912 | 0913 | 0914 | 0915 | 0916 | 0917 | 0918 | 0919 |
| 92 | 0920 | 0921 | 0922 | 0923 | 0924 | 0925 | 0926 | 0927 | 0928 | 0929 |
| 93 | 0930 | 0931 | 0932 | 0933 | 0934 | 0935 | 0936 | 0937 | 0938 | 0939 |
| 94 | 0940 | 0941 | 0942 | 0943 | 0944 | 0945 | 0946 | 0947 | 0948 | 0949 |
| 95 | 0950 | 0951 | 0952 | 0953 | 0954 | 0955 | 0956 | 0957 | 0958 | 0959 |
| 96 | 0960 | 0961 | 0962 | 0963 | 0964 | 0965 | 0966 | 0967 | 0968 | 0969 |
| 97 | 0970 | 0971 | 0972 | 0973 | 0974 | 0975 | 0976 | 0977 | 0978 | 0979 |
| 98 | 0980 | 0981 | 0982 | 0983 | 0984 | 0985 | 0986 | 0987 | 0988 | 0989 |
| 99 | 0990 | 0991 | 0992 | 0993 | 0994 | 0995 | 0996 | 0997 | 0998 | 0999 |

To discuss Rules *a* and *b* more generally, let "m" be any number. Then by the definition of a logarithm, when

| m lies between | log m lies between |
|--------------------|--------------------|
| (1) 1 and 10 | 0 and 1 |
| (2) 10 and 100 | 1 and 2 |
| (3) 100 and 1000 | 2 and 3 |
| (4) 1000 and 10000 | 3 and 4, and so on |

Therefore, when "m" has

- (1) 1 digit to the left of the decimal point, $\log m = 0 + \dots$
- (2) 2 digits to the left of the decimal point, $\log m = 1 + \dots$
- (3) 3 digits to the left of the decimal point, $\log m = 2 + \dots$
- (4) 4 digits to the left of the decimal point, $\log m = 3 + \dots$ and so on.

Hence Rule *a*.

In the case of decimal numbers,

| when m lies between | log m lies between |
|----------------------|-----------------------|
| (1) 1.0 and 0.1 | 0 and 1 -1 |
| (2) 0.1 and 0.01 | -1 and -2 |
| (3) 0.01 and 0.001 | -2 and -3 |
| (4) 0.001 and 0.0001 | -3 and -4 and so on. |

That is, when "m" is a decimal number in which

- (1) no cipher follows the decimal point, $\log m = 9 + \dots - 10$;
- (2) 1 cipher follows the decimal point, $\log m = 8 + \dots - 10$;
- (3) 2 ciphers follow the decimal point, $\log m = 7 + \dots - 10$;
- (4) 3 ciphers follow the decimal point, $\log m = 6 + \dots - 10$; and so on.

Hence Rule *b*.

INTERPOLATION.

Interpolation is the process of calculating numbers intermediate between those given in a table.

Find $\log 3784$.

From the table, mantissa of \log of 379 = 0.5786

From the table, mantissa of \log of 378 = 0.5775

0.0011 = difference.

Assuming that the increase in the logarithm is proportional to increase in the number, we have

mantissa of $\log 3784 = 0.5775 + 0.4 \times 0.0011 = 0.5779$.

The result here given to the nearest unit in the fourth decimal place 0.4×0.0011 being taken equal to 0.0004 in place of 0.00044.

PROPORTIONAL PARTS.

For convenience in interpolation, the tabular differences are subdivided into tenths and tabulated under the heading Proportional Parts. In the table given, it is the average of the differences given for the mantissas in one row across the page.

For the fourth figure, add the proportional part given under its column opposite the row of the first two significant figures to the mantissa of the first three significant figures. Thus:

$$\begin{array}{rcl}
 1. \quad \log 543.2 & = & ? \\
 \text{mantissa of } \log 543 & = & 0.7348 \\
 \text{prop. part for } 0.2 & = & \quad \quad 2 \\
 & & \hline
 \log 543.2 & = & 2.7350 \\
 2. \quad \log (251.9)^{2/3} & = & ? \\
 \text{mantissa of } \log 251 & = & 0.3997 \\
 \text{prop. part for } 0.9 & = & \quad \quad 15 \\
 & & \hline
 \log 251.9 & = & 2.4012 \\
 & & \hline
 & & 2 \\
 & & \hline
 & & 3)4.8024 \\
 & & \hline
 & & 1.6008
 \end{array}$$

Since $\log (251.9)^{2/3} = 2/3 \log 251.9$,

therefore, $\log (251.9)^{2/3} = 1.6008$,

or solving $(251.9)^{2/3} = 3.988+$.

3. $\log 0.07127 = ?$

mantissa of $\log 712 = 0.8525$

prop. part for 7 = 4

$\log 0.07127 = 8.8529 - 10$

4. $\log \sqrt[3]{0.08163} = ?$

$\sqrt[3]{(0.08163)} = (0.08163)^{1/3} = 1/3 \log (0.08163)$

mantissa of 816 = 0.9117

Prop. part of 3 = 2

$\log 0.08163 = 8.9119 - 10$

$4(8.9119 - 10) = 35.6456 - 40 = 25.6456 - 30$

$1/3(25.6456 - 30) = 8.5489 - 10$.

NOTE.—When a logarithm which is followed by -10 is to be divided by a number, add and subtract a multiple of ten so that the quotient will come out in a form followed by -10 .

Thus: $1/4 (8.244 - 10) = 1/4(38.2448 - 40) = 9.5612 - 10$.

ANTILOGARITHMS.

¶ The number whose logarithm is "x" is called the antilogarithm of "x." Thus, if $x = \log m$, then $m = \text{antilog } x$.

Given a logarithm, to obtain the corresponding number (antilogarithm).

1. $\log m = 0.4806$. $m = ?$

Find the first three figures in the mantissa in the antilog table similar to logarithm table only remember that zero in the mantissa before the other figures must be considered, and then add the proportional part of the fourth figure of the mantissa.

In the table of antilogarithms, find 0.48 in the left hand column and run across the page horizontally to the column headed 0. There we find that antilog of 0.480 = 3020. Add to this the proportional part under 6, which is 4. This makes the four figures 3024.

Now the characteristic tells how to place the decimal point counting from the left of the four figures, point off

1 place to the right for the characteristic 0

2 places to the right for the characteristic 1

3 places to the right for the characteristic 2

4 places to the right for the characteristic 3

If the characteristic is 9 — ... — 10 place decimal in front of figures.

If the characteristic is 8 — ... — 10 place decimal 1 place to the left.

If the characteristic is 7 — ... — 10 place decimal 2 places to left.

If the characteristic is 6 — ... — 10 place decimal 3 places to left.

2. $\log m = 7.0959 - 10$. $m = ?$

antilog 0.095 = 1245

prop. part 0 = 3

antilog 7.0959 — 10 = 0.001248

Sometimes there is a deficiency or excess of 1 in the fourth decimal, but in all pharmaceutical and chemical assaying, weighing, measuring, etc., if an accuracy of 0.1% is desired, the 4 place table will suffice, but if greater accuracy is desired the 5, 6 or the 10 place logarithms are needed. But for the most part 4 place decimal work is regarded good scientific work.

EXPLANATION OF TERMS USED IN FORMULAS.

I use the terms N/1, N/2, N/10 and N/50 as titles, and if the solution say N/2 H_2SO_4 is absolutely accurate and exact, I write it N/2 H_2SO_4 1.000, and if

otherwise, then $N/2 \text{ H}_2\text{SO}_4$ 0.99, or $N/2 \text{ H}_2\text{SO}_4$ 1.111 as the case may be. This is the C. F. or correction factor.

C. F. means the correction factor of a standard volumetric solution or the percent, upon the given normality. There is considerable difficulty experienced in obtaining absolutely accurate volumetric solutions, because of the influence of changes in temperature, humidity and pressure upon them, and the keeping qualities of these solutions. I have adopted the method of standardizing volumetric solutions just at the time of use, when running some pharmaceutical and chemical analyses, and the factor I determine I call the correction factor of the empirical solution, I am using, upon the given normality of that solution.

R. F. equals ratio factor, a ratio merely between two chosen solutions, regardless of whether they are absolutely standard or not, and the factor is always determined at the time of use.

E. F. equivalent factor, which depends entirely upon the normality of the standard volumetric solution chosen, and assumes that the normality chosen is 100% or has the C. F. of 1.000.

N/a and N/b are algebraic expressions, the a and the b must be given their proper values, and the C. F. of N/a , and E. F. of N/a , their proper values, so that the working of the formulas is possible. Where one formula leads on to the next, it is more convenient to carry over the logarithm of the numbers used, than to find the antilog.

These things will be brought out more clearly by example. (See Example, close of paper.)

There are two formulas for standardizing volumetric solutions:

Formula I.—General Standardization Formula—Solid.

$\text{Log Gm. of Standard} - \text{log E. F. of Standard for } N/a \text{ sol.} = \text{log mls } N/a \text{ sol. used} = \text{Log C. F. } N/a \text{ sol.}$ Find antilog.

This formula is used for determining the correction factor of a volumetric solution upon its normality, when standardized against a weighed amount of standard, which is a solid, as $N/2 \text{ NaOH}$ against $\text{KHC}_4\text{H}_4\text{O}_6$; $N/2 \text{ H}_2\text{SO}_4$ against Na_2CO_3 ; $N/10 \text{ HCl}$ as AgCl ; and $N/10 \text{ H}_2\text{SO}_4$ as BaSO_4 , etc. Here the N/a sol. means $N/2$ or $N/10$ as the case may be. The E. F. of N/a means E. F. for $N/2$ or $N/10$ sol. C. F. 1.000, and this is given by the fundamental law underlying volumetric chemical analysis that all substances always combine in the same proportion by weight.

Insert the proper values for Gm. of standard, for mls N/a sol., for E. F. of N/a sol., and apply Formula I; the result is the desired C. F. of the N/a sol.

Formula IIa.—($a = b$).

$\text{Log mls } N/a \text{ sol.} + \text{log C. F. } N/a \text{ sol.} - \text{log mls } N/b \text{ sol.} = \text{log C. F. of } N/b \text{ sol.}$ Find antilog.

Formula IIa'.—($a = b$).

$\text{Log mls } N/a \text{ sol.} - \text{log mls } N/b \text{ sol.} = \text{log R. F. } N/a \text{ sol. against } N/b \text{ sol.}$ Find antilog.

Formula IIa''.—($a = b$).

$\text{Log R. F. } N/b \text{ sol.} + \text{log C. F. } N/a \text{ sol.} = \text{log C. F. } N/b \text{ sol.}$ Find antilog.

Formula IIb.—($a > b$) $\times 5$.

$\text{Log mls } N/a \text{ sol.} + \text{log C. F. } N/a \text{ sol.} + \text{log } c - \text{log mls } N/b \text{ sol.} = \text{log C. F. } N/b \text{ sol.}$ Find antilog.

Formula IIb'.—($a - b$).

$\text{Log mls } N/a \text{ sol.} - \text{log mls } N/b \text{ sol.} = \text{log R. F. } N/b \text{ sol. in terms of } N/a \text{ sol.}$ Find antilog.

$\text{Log mls } N/a \text{ sol.} + \text{log } c - \text{log mls } N/b \text{ sol.} = \text{log R. F. } N/b \text{ sol. in terms of } N/b \text{ sol.}$ Find antilog.

Formula IIb'.—($a > b$).

$\log R. F. N/b \text{ sol.} + \log c + \log C. F. N/a \text{ sol.} = \log C. F. N/b \text{ sol.}$ Find antilog.

$\log R. F. N/b \text{ sol. as } N/b + \log C. F. N/a \text{ sol.} = \log C. F. \text{ of } N/b \text{ sol.}$ Find antilog

Formula IIc'.—($a < b$).

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/a \text{ sol.} - \log C - \log \text{mils } N/b \text{ sol.} = \log C. F. N/b \text{ sol.}$

Find antilog.

Formula IIc'.—($a > b$).

$\log \text{mils } N/a \text{ sol.} - \log \text{mils } N/b \text{ sol.} = \log R. F. N/b \text{ sol. as } N/a.$ Find antilog.

$\log \text{mils } N/a \text{ sol.} - \log \text{mils } N/b \text{ sol.} - \log c = \log R. F. N/b \text{ sol. as } N/b.$ Find antilog.

Formula IIc''.—($a > b$).

$\log R. F. N/b \text{ sol. as } N/a - \log c + \log C. F. N/a \text{ sol.} = \log C. F. N/b \text{ sol.}$ Find antilog.

$\log R. F. N/b \text{ sol. as } N/b + \log C. F. N/a \text{ sol.} = \log C. F. N/b \text{ sol.}$ Find antilog.

In the above formulas the Formula IIa is the most general, and the others modifications of it to meet the different cases.

The one volumetric solution here is standardized against another, the latter having a known correction factor from Formula I, then after properly placing the data, and applying Formula II, the result gives C. F. of the N/a sol. The several forms of Formula II cover changes in normality as N/2 to N/10, N/10 to N/50, and *vice versa*, where blank tests are run, and where one solution depends upon another standard solution for its correction factor at the time of use.

*Formula IIIa'.—*General Assay Formula Direct Titration.

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/a \text{ sol.} + \log E. F. N/a \text{ sol.} + \log 100 - \log \text{wt. substance taken} = \log \% \text{ w/w.}$ Find antilog.

$\% \text{ w/w} =$ absolute percentage, or percent by weight.

Formula IIIb'.—

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/a \text{ sol.} + \log E. F. N/a \text{ sol.} + \log 100 - \log \text{vol. substance taken} = \log \% \text{ w/v.}$ Find antilog.

$\% \text{ w/v} =$ percentage concentration, or percent weight to volume.

The foregoing Formula III applies to all direct titrations, and is also used after Formula IV in residual titrations for all crude drugs, chemicals and their preparations which are assayed volumetrically. The two forms cover the cases of desired $\% \text{ w/w}$ or $\% \text{ w/v}$. Placing the values properly will give the desired results.

Formula IV and its several modifications apply to residual titrations, where volumetric solutions of like or unlike normality are used, and after determining the difference, further calculations are carried out then by use of Formula IIIa or IIIb.

Formula IVa'.—($a = b$).

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/a \text{ sol.} = \log \text{mils } N, a \text{ sol. C. F. } 1.000.$ Find antilog.

$\log \text{mils } N/b \text{ sol.} + \log C. F. N/b \text{ sol.} = \log \text{mils } N/b \text{ sol. C. F. } 1.000.$ Find antilog.

Subtract the antilogs, and the result equals mils used by substance. Then apply Formula IIIa or IIIb as required.

Formula IVb'.—($a > b$).

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/a \text{ sol.} + \log c = \log \text{mils } N/b \text{ sol. used in excess.}$ Find antilog.

$\log \text{mils } N/a \text{ sol.} + \log C. F. N/b \text{ sol.} = \log \text{mils } N/b \text{ sol. used in residual titration.}$ Find antilog.

Subtract the antilogs and the result equals the mils used by the substance. Then apply Formula IIIa or IIIb, as required.

Formula IVb' from IVb'.—($a > b$).

$\log \text{mils } N/b \text{ sol. C. F. } 1.000 - \log c = \log \text{mils } N/a \text{ sol. C. F. } 1.000.$ Find antilog. Then apply IIIa or IIIb as required, using N/a E. F.

Formula IVc'.—($a < b$).

This is the same as IVb, only values of a and b are *vice versa*, therefore changes signs $+$ to $-$, and $-$ to $+$. Then apply Formula IIIa or IIIb.

There is one formula for gravimetric and electrolytic analyses. I have used this because the U. S. P. states how much of any substance should be present as such and such a weight, and so these formulas will give the percentage if the values are properly placed.

Formula Va.

Let m = wt. of sub. obtained, and w = wt. of sub. taken, then $\log m + \log 100 - \log w = \log \frac{c}{100} w/w$.

Formula Vb.

$\log m + \log 100 - \log V = \log \frac{c}{100} w/v$. c = vol. taken

It will be noticed that I introduced \log of 100 or 2.000 into Formulas III and V. This is done to make the $\frac{c}{100}$ be expressed with its sign. If one desires that it is expressed as a decimal fraction, omit the \log of 100. I have found the latter method too confusing, and so I have retained $\log 100$ and after the figures place the $\frac{c}{100}$ sign.

1. In order to use any empirical solution, I have tabulated for class and laboratory use the volumetric solutions of the U. S. P. and after them their abbreviations, and the formulas to be applied.

It has been my experience that $N \frac{1}{2}$, $N 10$ and $N 50$ solutions will suffice for nearly all the volumetric analyses, and therefore I have only listed those.

Tenth Normal Barium Hydroxide, $N/10$ $Ba(OH)_2$

Ia against $N/10$ HCl

Iib against $N \frac{1}{2}$ HCl

Tenth Normal Bromine, $N/10$ Br

Ia against $N/10$ $Na_2S_2O_3$ $\times 5$

Half Normal Hydrochloric Acid, $N 2$ HCl

I against Na_2CO_3

I as $AgCl$

Iia against $N/2$ KOH or $N 2$ $NaOH$

Iic against $N/10$ KOH or $N 10$ $NaOH$

Tenth Normal Hydrochloric Acid, $N 10$ HCl

I against Na_2CO_3

I as $AgCl$

Iia against $N/10$ KOH or $N 10$ $NaOH$

Iib against $N/2$ KOH or $N 1$ $NaOH$

Iic against $N 50$ KOH or $N 50$ $NaOH$

Tenth Normal Iodine, $N/10$ I

Ia against $N 10$ $Na_2S_2O_3$

Tenth Normal Oxalic Acid, $N 10$ $H_2C_2O_4 \cdot 2H_2O$

Ia against $N 10$ $K_2Cr_2O_7$ or $N 10$ $Na_2Cr_2O_7$

Tenth Normal Potassium Dichromate or Sodium Dichromate, $N 10$ $K_2Cr_2O_7$

$N 10$ $Na_2Cr_2O_7$

I against pure iron, Fe

Iib against $N 10$ KOH or $N 10$ $NaOH$ $\times e = 3$

Iia against $N 10$ $Na_2S_2O_3$

Half Normal Potassium Hydroxide, $N 2$ KOH

I against $KHC_4H_4O_6$

Iia against $N 2$ HCl or $N 2$ H_2SO_4

Iic against $N 10$ HCl or $N 10$ H_2SO_4

Tenth Normal Potassium Hydroxide, $N 10$ KOH

I against $KHC_4H_4O_6$

Iia against $N 10$ HCl or $N 10$ H_2SO_4

Iib against $N 2$ HCl or $N 2$ H_2SO_4

Fiftieth Normal Potassium Hydroxide, $N 50$ KOH

I against $KHC_4H_4O_6$

Iia against $N 50$ HCl or $N 50$ H_2SO_4

Iib against $N 10$ HCl or $N 10$ H_2SO_4

Half Normal Alcoholic Potassium Hydroxide, N/19 KOH al.

I against $\text{KHC}_4\text{H}_4\text{O}_6$

IIa against N/2 HCl or N/2 H_2SO_4

IIc against N/10 HCl or N/10 H_2SO_4

Tenth Normal Potassium Permanganate, N/10 KMnO_4

I against $\text{Na}_2\text{C}_2\text{O}_4$

IIa against N/10 Oxalic Acid, or N/10 Thiosulphate

Tenth Normal Potassium Sulphocyanate, N/10 KCNS

I against NaCl

IIa against N/10 AgNO_3 ; N/10 HCl; N/10 NaCl

IIb against N/2 HCl

Tenth Normal Silver Nitrate, N/10 AgNO_3

I against NaCl or as AgCl

IIa against N/10 KCNS; N/10 HCl; N/19 NaCl

Tenth Normal Sodium Chloride, N/19 NaCl

I as AgCl

IIa against N/10 AgNO_3

Half Normal Sodium Hydroxide, N/2 NaOH

I against $\text{KHC}_4\text{H}_4\text{O}_6$

IIa against N/2 HCl or N/2 H_2SO_4

IIc against N/10 HCl or N/10 H_2SO_4

Tenth Normal Sodium Hydroxide, N/10 NaOH

I against $\text{KHO}_4\text{H}_4\text{O}_6$

IIa against N/10 HCl or N/19 H_2SO_4

IIb against N/2 HCl or N/2 H_2SO_4

IIc against N/50 HCl or N/50 H_2SO_4

Fiftieth Normal Sodium Hydroxide, N/50 NaOH

I against $\text{KHC}_4\text{H}_4\text{O}_6$

IIa against N/50 HCl or N/50 H_2SO_4

IIb against N/10 HCl or N/10 H_2SO_4

Tenth Normal Sodium Thiosulphate, N/10 $\text{Na}_2\text{S}_2\text{O}_3$

I against Iodine

IIa against N/10 = $\text{K}_2\text{Cr}_2\text{O}_7$; N/10 $\text{Na}_2\text{Cr}_2\text{O}_7$; N/10 KMnO_4

Half Normal Sulphuric Acid, N/2 H_2SO_4

I against Na_2CO_3

IIa against N/2 KOH or N/2 NaOH

IIc against N/10 KOH or N/10 NaOH

Tenth Normal Sulphuric Acid, N/10 H_2SO_4

I against Na_2CO_3

IIa against N/10 KOH or N/10 NaOH

IIb against N/2 KOH or N/2 NaOH

IIc against N/50 KOH or N/50 NaOH

Fiftieth Normal Sulphuric Acid, N/50 H_2SO_4

I against Na_2CO_3

IIa against N/50 KOH or N/50 NaOH

IIb against N/10 KOH or N/10 NaOH

Copper Sulphate Solution of Fehling's, CuSO_4

I against Sugar

IIc against N/10 Thiosulphate (10 Cc. = 27.75 Cc. N/10 Thio)

Iodo Bromide Test Solution, IBr T. S.

IIc against N/10 Thiosulphate

2. For use in class and in the laboratory, I have tabulated all the assays of the U. S. P. and N. F., volumetrically, gravimetrically, and electrolytically, and after the Latin abbreviation give the formula to be applied.

The list is as follows:

U. S. P. IX.

| Volumetric | Latin Abbreviation. | Formula. | Volumetric | Latin Abbreviation. | Formula. |
|------------|------------------------|---------------------------|------------|------------------------------|-------------|
| 1 | Aceton. | IVa & IIIa | 48 | Calc. Chlor. | IVa & IIIa |
| 2 | Acid. Acet. | IIIa | 49 | Calc. Hypophos. | IVa & IIIa |
| 3 | Acid. Acet. Dil. | IIIa | 49 | Calc. Lact. | IIIa |
| 4 | Acid. Acet. Glac. | IIIa | 50 | Calc. Sulphid. Crud. | IVa & IIIa |

As 4 place logarithms are sufficiently accurate for almost all of the present pharmaceutical assaying, the E. F. of substances for N/2, N/10 and N/50 solutions, as found in U. S. P., can be easily changed into their corresponding logarithms. I have likewise made a list of these logarithmic equivalents, but have not put them into the body of this paper, because applying the rule for logarithms it is easy to find the one that is needed, or many chemical annuals give those values, but for convenience in pharmaceutical assaying I have listed them under headings N/2, N/10 and N/50 instead of under each volumetric solution, and have appended them to this paper, at the very close.

It may still appear useless and too far-fetched and beyond the average intellect of the pharmacy student to apply such a mathematical training to pharmaceutical assaying. Let me state, in closing, that when I presented this a year ago last summer to the conference of instructors at the University of Wisconsin, under the leadership of Dr. Edward Kremers, I was asked by Mr. Roland Kremers if I really taught such engineering rules to the pharmacy students. In reply, I said "I really did," and I still do so. It has been my peculiar experience, as a pharmacy student, to have been well grounded in engineering physics and mathematics, and these, combined with chemistry, pharmacology, physiology and pharmacy, have given me a little insight into some of the complexities found in pharmaceutical assaying.

If I can calculate the results correctly from the standardization of a volumetric solution to the assay of a crude drug, chemical, or their preparations by direct or residual titration inside of 5 to 10 minutes, once the data are obtained, and the tables at hand, I feel that the method is certainly a time and labor saving device, as well as accurate, and one that can be rechecked quickly. However, when I have several hundred mathematical calculations in pharmaceutical assaying to look over and correct, I personally use the slide rule, and it takes but a moment to see where errors and blunders have been made.

I could also append the discussion of experimental error, mathematical error; such as absolute error; percentage of error; and probable error; which is involved in

all pharmaceutical assaying, but I have purposely omitted it from this paper because it would make it quite lengthy, and is also an entirely different phase, yet very important in pharmaceutical assaying, and tells why some things are really difficult, and the accuracy that can be attained.

In order to show by concrete example how these formulas apply, consider the following example:

Given—4.704 Gm. $\text{KHC}_4\text{H}_4\text{O}_6$ require 45.82 mls $\text{N}/2$ NaOH for neutralization.

Also—48.75 mls $\text{N}/2$ H_2SO_4 neutralize 42.96 mls $\text{N}/2$ NaOH .

In assaying a sample of hydrated chloral, 3.039 Gm. of it, after the addition of 50 mls $\text{N}/2$ NaOH , standardized as above, in excess, upon residual titration, required 22.35 mls $\text{N}/2$ H_2SO_4 .

What is the % strength of the hydrated chloral?

1st. Apply Formula I to get C. F. of $\text{N}/2$ NaOH .

$$\begin{array}{rcl}
 \log 4.704 & 0.6725 & 1 \text{ ml } \text{N}/2 \text{ NaOH} = 0.09407 = 8.9734 - 10 \\
 - \log \text{E. F. } 0.09407 & 8.9734 - 10 & \\
 \hline
 & 1.6991 & \\
 - \log \text{ mls } = 45.82 & 1.6611 & \\
 \hline
 = \log \text{ C. F. } \text{N}/2 \text{ NaOH} & 0.0380 & = 1.091
 \end{array}$$

2nd. Apply Formula IIa to get C. F. of $\text{N}/2$ H_2SO_4 .

$$\begin{array}{rcl}
 \log 42.96 & 1.6320 & \\
 + \log 1.091 & 0.0380 & \\
 \hline
 & 1.5940 & \\
 - \log 48.75 & 1.6879 & \\
 \hline
 = \log \text{ C. F. } \text{N}/2 \text{ H}_2\text{SO}_4 & 0.9061 & 10 = 0.8056
 \end{array}$$

3rd. Apply Formula IVa for residual titration.

$$\begin{array}{rcl}
 \log 50 & 1.6990 & \\
 + \log 1.091 & 0.0380 & \text{antilog or no} \\
 \hline
 & 1.7370 & = 54.58 \text{ mls } \text{N}/2 \text{ NaOH } 1.000 \text{ used in excess} \\
 \hline
 \log 22.35 & 1.3493 & \\
 + \log 0.8056 & 0.9061 - 10 & \\
 \hline
 & 1.2554 & 18.61 \text{ mls } \text{N}/2 \text{ H}_2\text{SO}_4 1.000 \text{ mls used in residual titration}
 \end{array}$$

36.57 mls $\text{N}/2$ sol 1.000 used by hydrated chloral

4th and lastly. Apply Formula IIa for % of hydrated chloral.

$$\begin{array}{rcl}
 \log 3657 & 1.5630 & \\
 + \log 0.08270 & 8.9175 - 10 & \\
 + \log 100 & 2.0000 & \\
 \hline
 & 2.4805 & \\
 - \log 3.039 & 0.4827 & \\
 \hline
 = \log \% & 1.9978 & = 99.5\%
 \end{array}$$

DEPARTMENT OF PHARMACY,
UNIVERSITY OF NEBRASKA.

MEETING OF AMERICAN METRIC ASSOCIATION.

A metric meeting given by the New York Academy of Sciences and the American Metric Association was held at the American Museum of Natural History, New York, on Monday evening, November 4th.

The speakers were Dr. Robert Lowie, who presented the development of numbers and measurements from the times of primitive peoples to modern civilization, describing interestingly the early use of numbers and the mathematical notion in folk-lore; Mr. Howard Richards, Jr., who discussed the right usage of metric weights and measures; and Dr. Chester A. Reeds, who gave a geologist's estimation of the decimal method of computation in comparison with the systems used in America.

These papers were discussed by Dr. William Jay Schieffelin, Mr. Maximilian Toch, Mr. A. A. Cary, Dr. H. V. Army and Mr. John Francis.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

TO THE BRANCHES OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

On account of the campaign for the Fourth Liberty Loan, meetings of Branches were not held. Soon thereafter the prevalence of influenza interfered with the meetings, but it is hoped that the Branches will soon again begin holding their monthly meetings regularly. The JOURNAL will be pleased to receive the papers read at the Branches and recommended for publication.

Druggists of Wilkes-Barre, Pa., and vicinity organized the Luzerne County Branch of the American Pharmaceutical Association with fifty-one members. This shows the possibility of establishing many more Branches throughout the country, and the idea of inviting the pharmacists of the county wherein the Branch is to be organized to affiliate is a good one, and makes it possible to discuss business matters in which not only the druggists of one city are interested, but throughout the county. There are many topics of particular interest at the present time, especially in view of the

fact that the beginning of the end of the war is at hand.

THE JOURNAL OF THE A. PH. A.
253 Bourse Bldg., Philadelphia, Pa.

CHICAGO.

The invitations to the ninety-seventh monthly meeting of the Chicago Branch of the American Pharmaceutical Association, to be held at the City Club October 17th, 8:00 P.M., announced as the topic of the meeting "Organized Pharmacy Is Doing Its War 'Bit' in a Great Big Way."

The presidents or secretaries of ten pharmaceutical organizations had been asked to respond with a ten-minute report on the war activities of their organization. Many acceptances had been received and arrangements completed for a dinner to precede the meeting when announcement was made by our State authorities that all public gatherings must be prohibited on account of the spread of the influenza epidemic. Therefore this meeting has been indefinitely postponed by order of the Executive Committee of the Chicago Branch. E. N. GATHERCOAL, *Secretary*.

CORRESPONDENCE

CORRECTION FOR ARTICLE ON SILVER COMPOUNDS.

October 24, 1918.

EDITOR JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

Correction for article on Silver Compounds, JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, August 1918, page 679, first and second lines of paragraph headed "Technic," should read:

"One Cc. of a 1:10 solution of the silver salt is diluted with 10 Cc. of distilled water and shaken with 0.5 Gm. of 'Lloyd's Reagent,' etc."

Very truly yours,

(Signed) TORALD SOLLMANN.

Cleveland, October 24, 1918.

DEFERRED CLASSIFICATION FOR PHARMACISTS.

EDITOR JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

I am happy to be able to state that as the result of an effort on my part as per correspondence which I give below, I have secured a decision by the Surgeon General and the Provost Marshal General Crowder, to the effect that drug clerks and registered pharmacists be not drafted into the Army during the influenza epidemic, and that thereafter a deferred classification should be given them if they can show, as practically all of them can, that their position is "necessary to the enterprise in which they are engaged." This is the first successful effort made to have pharmacy recognized as an essential profession and industry, and this should be promptly followed up and given all the publicity possible, so as to get behind our movement for a pharmacy corps public sentiment through the press:

"Baltimore, October 10th, 1918.

"TO THE SURGEON GENERAL'S OFFICE,

"WASHINGTON, D. C.

"GENTLEMEN:

"On behalf of the pharmacists and pharmaceutical colleges of this country I am again addressing you in this emergency brought to the attention of the people and the medical profession by the epidemic now raging all over the land. I appeared before your office with seventeen other representative gentlemen representing the National Drug Trade Conference in behalf of recognition of pharmacy as an essential industry and profession, on September 26th, and were heard by General Richard and Colonel Darnell. You refused to recognize pharmacy as an essential industry and as a needed branch in the army establishment. Today the country is confronted by a demand for pharmacists' skill and services unprecedented in its history. Pharmacies by the hundred are being closed because their owners or their registered clerks are being drafted into the army. The result is, pharmacies by the hundreds everywhere, are overrun with prescriptions for the epidemic and they have to close their stores because they cannot handle the work, and many are working all night and day. Therefore, the Provost Marshal, under the advice of the Surgeon General's office, should give registered pharmacists in the draft deferred classification to enable the civilian population to secure their medicines. Hundreds and thousands of patients are unable to procure medicines during the past few days and more and more pharmacists are lying down sick from overwork and worry which is fast bringing on a crisis all over the east. It would seem that pharmacy is today being shown to be one of the direst needs of the public and the medical profession to help quell the epidemic and save the lives of our people. Will the Surgeon General's office still refuse to recognize the need of the people today for pharmaceutical service? Please inquire of health boards in any of our cities and let them tell you of the deplorable conditions in the dispensing of medicines. Dr. John D. Blake, the health commissioner of Baltimore, told us today that he felt the Surgeon General's office had made a mistake in refusing to recognize pharmacy, and should do so, and induce Provost Marshal Crowder to release many of the pharmacists in the draft for return to their stores to help out the fighting of this epidemic in this country by giving them deferred classification. I am enclosing a clipping from today's *Baltimore Sun* on the subject. The Educational Board also should recognize pharmacy students as worthy of forming, if necessary, in conjunction with other units military organizations, so that our colleges of pharmacy will not have to close and cut off the future supply of pharmacists so urgently needed at all times for the public health, and especially so badly needed now.

"Respectfully submitted,

"(Signed) A. R. L. DOHME."

A copy of this same letter was simultaneously sent to Provost Marshal General Crowder, Surgeon General Rupert Blue of the Public Health Service, and Prof. Charles E. Munroe, Chairman of the Board of Educational Instruction.

The following reply was received under date of October 16th from the Provost Marshal General:

"DR. A. R. L. DOHME,

"MEMBER EXECUTIVE COMMITTEE,

"AMERICAN DRUG MANUFACTURERS ASSOCIATION,

"CR. SHARP & DOHME, S. W. COR PRATT & HOWARD STS.,

"BALTIMORE, MARYLAND.

"DEAR SIR:

"I have read with interest copy of your letter of October 10th, addressed to the Surgeon General's Office, in which the importance of pharmacy as a necessary industry is submitted. In order to overcome the situation brought about as a result of drug clerks being drafted into the Army and the heavy demands that are made upon pharmacists at the present time, it has been suggested that this office release many of the pharmacists who have been called to the colors and grant them a deferred classification so that they may resume their civilian employment and assist in fighting the epidemic.

"Upon induction of a registrant into military service the jurisdiction of the Selective Service Law and of this office terminates, and all questions pertaining to the release of soldiers from the Army are consequently for the determination of the military authorities. Hence the suggestion advanced by the Health Commissioner of Baltimore could not be put into effect by this office.

"As far as the selection of men for military service is concerned, the matter lies entirely in the hands of District Boards, which are authorized by the Selective Service Law, to consider claims for deferred classification based upon engagement in industries, occupations, or employments. The recognition of a particular trade or business as an 'essential' industry, occupation or employment is not binding upon District Boards which, in considering claims for deferment based on industrial or occupational grounds, must find, first: whether the industry, occupation or employment is 'necessary' to the maintenance of the Military Establishment, the effective operation of the military forces, or the maintenance of national interest during the emergency, and, second, whether the individual himself is, within the meaning of the Law, 'necessary' to the enterprise in which he is engaged.

"E. H. CROWDER,

"Provost Marshal General.

"(Signed) By ROSCOE S. CONKLIN,
Lieut. Colonel, J. A., Chief, Classification Division."

and from the Surgeon General's office under date of October 18th has come in response to my letter the statement that the Surgeon General's office has recommended to the Provost Marshal that drug clerks and pharmacists be not drafted into the Army during the influenza epidemic.

I feel that this information should go out at once through all pharmaceutical journals to the pharmacists of the country so that they may be benefited promptly by the decision of the Army chiefs. While I have had no reply yet from the Educational Committee, I have heard that colleges of pharmacy are being taken care of by permitting pharmacy students to join Army Reserve Units at educational institutions and I hope that every college of pharmacy will not fail to use this information to the utmost in helping itself to maintain its position and courses, and induce young men to continue to pursue its courses, for provision for future pharmacists must be made in the interest of public health and welfare.

If we had adopted and put into effect federated pharmacy with a central office and an efficient, well-paid publicity department, we could have handled this epidemic and draft situation much more promptly and effectively.

Our hope now is that pharmacists will realize the value of coöperation and federation, and not let the narrow views of a certain few men high in authority in certain associations, prevent the accomplishment of a much-needed federated effort and organization in pharmacy.

I am also informed that many of the pharmacists in the army camps among the drafted men have returned to their homes for service in this epidemic emergency; at least that is the case at Camp Meade, here near Baltimore.

Very truly yours,

Baltimore, October 23, 1918

(Signed)

A. R. L. DOHME.

REPORT OF CONFERENCE ON SPECIAL BULLETIN ON PROGRAM IN PHARMACY.

TO THE PHARMACEUTICAL PROFESSION OF AMERICA:

Under date of October 1, 1918, the War Department's Committee on Education and Special Training issued a Special Bulletin on Program in Pharmacy. This program is being given publicity in the current pharmaceutical press and will in this way be called to the attention of all interested. However, Dr. E. L. Newcomb, of the *Northwestern Druggist*, has suggested and others have requested, that an official statement be made concerning a Conference recently held in Washington relative to this matter. This conference was called by the Committee on Education and Special Training through the Educational Director, Dr. R. C. Maclaurin.

Delegates from a number of representative colleges were requested by wire to meet with the War Committee on September 20th, at 10:00 A.M., Old Land Office Building, Washington, to discuss the relation of students in the Colleges of Pharmacy to the S. A. T. C. The Institutions asked to send delegates were the Massachusetts College of Pharmacy, The University of North Carolina, the School of Pharmacy of the Medical College of Virginia, Columbia University, Western Reserve University, Purdue University and the Universities of Michigan, Minnesota and Nebraska. All of these institutions were represented at the Conference except the first two named.

At the time and place appointed the delegates met representatives of the Educational Committee. Doctor Maclaurin briefly and clearly announced the reasons for the call to Washington. The following is the substance of his statement.

The War Department had decided for the efficiency of the Army Medical Service to prepare for a pharmacy unit in the S. A. T. C. Furthermore, it is the intention of the War Department to retain a sufficient number of pharmacy students in school so that the civilian population shall not suffer because of a lack of properly qualified pharmacists. He stated that no school could be considered as an S. A. T. C. institution which did not require at least a four-year high school course for entrance or could come to such a requirement on very short notice, and furthermore, schools of a purely commercial type would not be considered. The amount of military instruction and training which would be required by the War Department of students in the S. A. T. C. was stated and Dr. Maclaurin then asked that the representatives present organize as a committee and work out a pharmacy program running through eight quarters of three months each, which would, in the opinion of the committee, best accomplish what the War Department has in mind to do. The Program which was worked out is issued as Special Bulletin on Program in Pharmacy. (See next report.)

Dr. Maclaurin also asked the committee to give information concerning the Colleges of Pharmacy which would help the Committee on Special Training to determine the fitness of the various schools to become S. A. T. C. institutions. This the Committee did to the best of its ability, but the information given was only for the purpose of giving the War Committee something tangible to build upon. It is safe to say that the college representatives felt when confronted by this problem, as never before, what it would mean to pharmaceutical education if we could have had the results of a Carnegie Foundation investigation and classification to present to the War Committee.

The Chairman wishes to say in closing that the attitude of Dr. Maclaurin and the other members of the War Committee toward the representatives of the Colleges was courteous, dignified, respectful and, perhaps above all, was sympathetically helpful in the problems they were asked to solve. We feel that one more incident has occurred which will assure to professional pharmacy a greater future.

COMMITTEE ON EDUCATION AND SPECIAL TRAINING.

SPECIAL BULLETIN ON PROGRAM IN PHARMACY.

The program here presented is not prescribed, but is an example of what will be approved. It is intended to indicate how existing programs may be modified by elimination and condensation so as to meet the needs of the present emergency. The program covers eight terms of twelve weeks, but it must not be inferred that every student entering on such a course will be kept at college until he completes it. The time that he will be permitted to pursue the course will depend on the needs of the service and the academic record of the student. In addition to the instruction indicated in the program, eleven hours per week of military instruction are prescribed for the first three terms of the program, and six hours per week for the remainder of the program. The total time to be devoted to military and academic instruction, including examinations, lectures, recitations, laboratory work and supervised study, is 53 hours per week. The hours set forth in the program represent the total time devoted each week to the subjects named. The relation of the time given to study to that assigned to lectures, recitations and laboratory work varies considerably with the nature of the subject, but on the average the former is not more than half of the total time allotted. The subject, War Issues, which must be combined with English Composition, is, with the exceptions indicated in Section 26 of the Regulations of the S. A. T. C., prescribed for three terms with nine hours per week for lectures, recitations and study.

COMMITTEE ON EDUCATION AND SPECIAL TRAINING.

By R. C. MACLAURIN,

Educational Director, Collegiate Section.

October 1, 1918.

AMERICANIZATION OF FORMER ENEMY-OWNED CONCERNS.

Many inquiries regarding the status of the Bayer Company and other enemy-owned concerns taken over by the Alien Property Custodian and the ultimate disposal of the money received from the sale of such concerns have come to the Alien Property Custodian's office. In order to clear up what seems to be a general misunderstanding regarding the functions of this office and the scope of its work, A. Mitchell Palmer, Alien Property Custodian, has made the following statement:

"The office of Alien Property Custodian was created by the 'Trading with the Enemy Act,' which was approved October 6, 1917. Under the provision of this Act, the Alien Property Custodian is directed to hold, administer and account, under the general direction of the President, for all enemy property he has taken over. The Act provides that after the end of the war, 'any claim of any enemy or of an ally of enemy to any money or other property received and held by the Alien Property Custodian, or deposited in the United States Treasury, shall be settled as Congress shall direct.' The Act also directs the Alien Property Custodian to deposit in the Treasury of the United States the proceeds of the sale of any property in his custody, to be invested in bonds.

"It can readily be seen therefore, that the functions of the Alien Property Custodian are merely those of a trustee, that all enemy money and property taken over by him is held in trust, and that Congress has reserved to itself the final disposition of such property.

"The Bayer Company, like all other companies taken over by me, is not now enemy-owned, and never will be enemy-owned again. All the stock is now held by the Alien Property Custodian representing the United States Government, and it is being operated by one hundred percent Americans as an American concern. The Bayer Company will be sold at public auction on December 3rd to American citizens only. Before the sale is finally consummated by me, it will be passed upon by the Advisory Committee, of which Otto T. Bannard, of New York, is Chairman.

"This course will be followed with each of the two hundred or more concerns which are now in my custody. I am going to put upon the auction block every one of the great industries in America, which formerly were German-owned, and sell them to American citizens.

"The policy of the Government, as fixed by the Act of Congress, is to sell these properties to American citizens as going concerns for fair and adequate values, and I would not be performing my duty in the carrying out of that policy if I did not operate the properties, pending sale, in the same efficient and profitable manner that they have heretofore been operated. If these properties are destroyed, there will be nothing to sell to American citizens.

"The Americanization of the former enemy-owned concerns in my custody is a big task, and it requires the heartiest coöperation of the business men of this country to be successful. The German agents have had their hands on practically every important American industry. They acquired large interests in the chemical and drug, the lumber, the dyestuff, the metal, the shipping, the textiles, the woolen, the cotton, and practically every other vital industry in this country. The value of the German ownership in these concerns is upward of three hundred million dollars. I propose to wipe out every trace of this German ownership by selling these properties to one hundred percent Americans.

"On December 4th, Heyden Chemical Works, at Garfield, N. J., will be sold at public auction."

COMMITTEE REPORTS

REPORT OF THE SUB COMMITTEE OF THE A. P. H. A., OF THE JOINT COMMITTEE ON NOMENCLATURE OF CULTIVATED PLANTS.*

The catalogue of scientific and popular names of shrubs and trees that was published last year by the Joint Committee, and copies of which were distributed at the preceding meeting of this Association, has accomplished considerable good. It did not adhere strictly to proper rules of nomenclature, because the Committee was obliged to compromise with a purely commercial element that was not sufficiently considerate of the just claims of science upon those whose business success was made possible by the benefits that science had conferred upon them. Nevertheless, even this element conceded something, so that a step was taken in the direction of correct nomenclature.

Another result attained was that of forcing consideration and discussion of the principles of nomenclature, even upon those who are opposed to them. If we can once get a question of right and wrong up for discussion, we may confidently depend upon the correct side to gain in strength, however slowly, as the discussion proceeds.

A third result has been that of securing some uniformity in the matter of violations of principle. If people are to violate a rule, there is at least a practical advantage in getting them to agree on a single incorrect form, thus lessening confusion, costly mistakes and discomforting disputes.

It should therefore be accepted that the first work of the Committee has brought forth valuable fruits.

It is planned to go ahead with this work along the same lines, taking up another group of plants, the nomenclature of which is in great disorder. Much work in this direction has already been done since our last meeting by individuals and sub-committees and the plans for future work are of a very definite character. I will say now as I said last year, that the great majority of plants under consideration by the Committee have no direct application to medicine or pharmacy, but that both professions, and especially pharmacy, have a strong indirect interest in securing general accuracy and stability in plant names, and I trust that the Association will not take a narrow view of its obligations but will continue to cooperate in this work, the results of which will be monumental in applied botany.

I would like to refer especially to the work of my colleague, Mr. Farwell, in this bibliographical enterprise. He is exceptionally favored by having access to extensive library and herbarium facilities and has a keen interest and special ability in this line of work.

Should the Association so desire, I will be glad to submit a detailed report of progress and plans for printing in the Association Journal.

I have two recommendations upon which I should like the action of the Association.

The first is that the Association should appropriate \$150 for the expenses of the Joint Committee. All this money is economically expended for the most necessary purposes. Contributions range from \$150 to \$300 from the different organizations concerned, and there are various individual contributions also. Last year I secured \$100 from friends in the Association and this would be possible again although it is neither right nor desirable. If the Association is interested in the work and maintains a sub-committee, it ought to contribute as an organization.

The second recommendation is that we should express our opinion on a proposition to drop the final "i" from such names as "Dillenii" and "Fabii." These names are the genitive forms, respectively, of "Dilleniuss" and "Fabius;" and according to every rule of nomenclature should end in two "i's." In the case of the genitive form of "Brutus," we should, of course, have but a single "i." Some of the correspondents of the Joint Committee who are either not versed in the rules of the subject or who are not properly interested in them wish to drop the final "i" from the botanical name simply as a matter of convenience. While we should not seriously

Presented at Second General Session, A. P. H. A., Chicago meeting, 1918. The item of expense was referred to the Council, and the second resolution to the Committee on Resolutions and afterward favorably reported and approved. (See minutes of Final General Session.)

oppose juggling with common names, in the interest of practicality, we feel that the botanical names should be respected. We therefore submit the following resolution and trust that you will adopt it.

WHEREAS, Botanical names are essentially foreign in origin and form, and should be dealt with in accordance with the rules of the language to which they pertain; therefore it is

Resolved, That in the opinion of the American Pharmaceutical Association, the Joint Committee on Nomenclature should not drop the final "i" of specific botanical names which retain them in accordance with such rules.

Respectfully submitted,

H. H. RUSBY, *Chairman*.

REPORT OF THE COMMITTEE ON THE NATIONAL FORMULARY.*

Your Committee on National Formulary has been occupied during the past year with a consideration of plans for the next revision of the National Formulary. During the last revision confusion and delay resulted at times because of misunderstandings regarding the plan of the work, and it became evident that an efficient plan at the start for the work of revision is an important factor in the obtaining of results. At the meeting of the Association at Atlantic City this Committee made the following recommendation, which was afterward adopted by the Council:

"We recommend that with the appointment of the (next) committee general principles be outlined for the guidance of the revision, and that thereafter the final decision on all questions pertaining to the revision be left to the Committee."

The plans which the present committee has considered pertain only to the method of distributing the work, and do not include general principles for the control of the revision. The system which we herewith propose is not intended to be mandatory, but only to give to our successors the benefit of our experience in the work of revision and to suggest means by which the work may be expedited. Future conditions will probably demand some changes in the details, and it is not intended to hamper in any degree the judgment or desires of the next committee by a closed method for the revision.

With this interpretation we recommend that the work of the next committee be based on the following plan:

Time.—That future revisions of the National Formulary should be made simultaneously with those of the United States Pharmacopœia.

Organization.—Future committees should consist of 15 members, to be appointed each ten years by the Council of the American Pharmaceutical Association. The officers of the committee should consist of a Chairman, Vice-Chairman and Secretary, to be elected by the committee.

Plan of Work.—The committee should apportion its work to the following sub-committees which shall report to the general committee:

1. On Admissions, Deletions and Nomenclature.
2. On Botany and Pharmacognosy.

(To have charge of the preparation and revision of text for vegetable drugs in Part II.)

3. On Chemistry and Assays.

(To prepare text or revise the text for chemicals in Part II, and to add or revise such assay processes as are needed throughout the book.)

4. On Doses.
5. On Elixirs.
6. On Syrups, Spirits and Wines.
7. On Fluidextracts.
8. On Fluidglycerates and Tinctures.
9. On Infusions, Liquors, Mixtures, and Emulsions.

* Read before Section of Practical Pharmacy and Dispensing and referred to the Council.

10. On Pills, Powders, Species, Effervescent Salts, Troches, Pastes, and Pencils.
11. On Glycerogelatins, Liniments, Lotions, Nebulae, Muls, Oleates and Ointments.
12. On Miscellaneous Preparations not included in the above.

The above division of work is more equable than may appear on first reading and it conforms to natural divisions. It may be modified in detail as conditions demand.

Considerable attention was paid to the question of increasing the number of members from 15 to 25, but after discussion it was decided to recommend the present number of members, as is required in the Association By-Laws. While an increased membership would lighten the demand for laboratory work on individual members, it prevents as many personal conferences as fifteen members may hold, and one day of conference of this kind can accomplish as much as many weeks of work by correspondence. A smaller committee also is more prompt in its work, is usually more harmonious, and saves much time in correspondence.

The question of alternate formulas, or the temporary dropping of formulas for preparations containing glycerin or sugar, as a war measure, has also received attention. This question was brought to us from several sources, and at first a considerable sentiment was displayed toward extreme conservation of glycerin and sugar. But the necessity for such measures has not yet appeared sufficiently urgent for action, and the matter is held in abeyance.

When it is considered that the total amount of sugar used in pharmaceutical preparations of all kinds is less than half as much as is used in tobacco, less than is used in chewing-gum and less than a tenth of that used in soft drinks, it does not seem needful that the sick should be the first to be deprived of their share of pleasure.

No figures are yet available for glycerin, but we can depend upon an imperative demand being made by the War Department if stringent conservation of glycerin should become necessary. So at present the committee is following the policy of watchful waiting on these questions.

The question of issuing a supplement in 1919 has also received attention. At present there appears no marked demand for such, and official changes in formulas or additional official formulas within the ten-year periods are troublesome to pharmacists and unless really necessary are inadvisable. Under present conditions official changes are especially unwelcome and thus far criticisms of the National Formulary IV do not indicate a need of immediate revision. Therefore, unless war conditions should develop some situation which calls for immediate action within the next year, this present committee may consider its work as finished.

Respectfully,

WILBUR L. SCOVILLE, *Vice Chairman.*

REPORT OF COMMITTEE ON PHYSIOLOGICAL TESTING.*

Although concerted experiments by the Committee are lacking, largely for the reason stated by its Chairman, there has been considerable work along the lines of Biological Standardization which seemed of sufficient importance to summarize.

The bibliography herewith submitted, with short abstracts of articles, may not be complete but includes all that came to the Chairman's attention. Several of these must be noted by title only, as neither the article nor an abstract could be found on short notice.

ABSTRACTS AND BIBLIOGRAPHY OF PHYSIOLOGICAL STANDARDIZATION, 1917-1918.

"*den Besten und de Lind von Syngaarden*, Physiological Standardization of Digitalis Preparations upon warm blooded animals," *Nederl. Tydschr. Geneesch.*, Amsterdam, 1917, 2, p. 479.

Colson, "Biological Standardization of the Heart Tonic Preparations," *JOURNAL A. PH. A.*, 1918, 7, 13.

Tests were carried out by the M. S. D. Frog Method and the Cat Method, slightly modified. He concludes that the former is subject to too many variables to make it practicable or

* Presented at second General Session, A. Ph. A., Chicago meeting, 1918. Chairman E. M. Houghton stated that owing to press of other work in connection with the manufacturing of supplies for the U. S. Government (U. S. Army Medical Service), the members of the Committee were unable to prepare a report, but present this in lieu of it to show the progress of the year in physiological testing.—EDITOR.

accurate and that the Cat Method has much to recommend it. He admits that the Cat Method belongs to the toxic type of assay but is convinced that the digitalis action is on the heart and not on the respiratory centers.

Colson and Engelhardt, "Is the Biological Standard of Squill and the Preparations thereof Correct?" *JOURNAL A. PH. A.*, 1917, 6, p. 950.

The authors submit data of tests of squill by three methods, the M. L. D., M. S. D., and Cat Methods, and claim that the U. S. P. standards for squill are incorrect, the toxicity by the Cat Method being only one-half that of digitalis.

Eckler, "On the Deterioration of Crude Indian Cannabis," *JOURNAL A. PH. A.*, 1917, 6, p. 872.

The author shows by tests that the attic-stored crude drug loses its activity entirely in 5 years, while in a cool basement the average yearly loss is only one-half as great.

Eckler, "Apparatus for Studying the Effect of Drugs on the Isolated Guinea Pig Uterus," *Journ. of Lab. and Clin. Med.*, 1917, 2, p. 819.

This is a detailed description with cuts showing an apparatus designed to control the various factors concerned in the assay of pituitary extracts on the isolated guinea pig uterus.

Focke, "Ueber die physiologische Wertmessung des Digitalysate," *Zeitschr. f. Exp. Path. & Therapie*, 1916, 18, p. 382.

Hamilton, "Biological Standardization," *Amer. Journ. of Pharm.*, 1917, 89, p. 61.

The author criticizes the methods or the technic adopted by the U. S. P. Revision Committee for the biological assay of cannabis, adrenalin and pituitary products and the digitalis series of heart tonics, pointing out errors and suggesting improvements.

Hamilton, "The Stability of Cannabis and Its Extracts," *JOURNAL A. PH. A.*, 1918, 7, p. 333.

The author takes issue with Eckler as to the rate of deterioration of cannabis, showing results of the drug 15 and 21 years old as being still 75 and 30 percent of standard. The drug was kept in bottles on the laboratory shelves.

Hamilton, "The Deterioration of Digitalis Extracts," *JOURNAL A. PH. A.*, 1918, 7, p. 433.

The author points out that while some samples of digitalis tincture have deteriorated greatly in a short time the average deterioration is far below that observed by Pittenger and Mulford, Jr.

Hall and Hamilton, "Investigation on the Composition of Oil of Chenopodium and the Anthelmintic Value of Some of Its Components," *Journ. of Pharm. and Exper. Therap.*, 1918, 61, p. 231.

The authors show by tests of oil of chenopodium and of various fractions of the oil that while the activity is not improved, the objectionable features are largely eliminated by selecting a fraction—about 70 percent—rather than using the whole oil as an anthelmintic.

Krogh, "The Physiological Standardization of Digitalis," *Ugeskr. f. Laeger*, 1917, 79, p. 475.

This author assayed digitalis preparations by use of the isolated frog's heart, selecting as the endpoint the amount of drug, applied by perfusion, necessary to arrest spontaneous contraction. He considers the method accurate within 10 percent.

Morris, "Standardization of Digitalis and Potency of the Minnesota Leaf," *Journal Lancet*, 1917, p. 176.

Pittenger, "Biological Assay Methods of U. S. P. IX," *JOURNAL A. PH. A.*, 1917, 6, p. 865.

This is a critical review of the biologic assay methods of the U. S. P., with suggestions for improving the technic and as to the standards employed.

Pittenger, "An Improved Apparatus for Testing the Activity of Drugs on the Isolated Uterus," *JOURNAL A. PH. A.*, 1918, 7, p. 512.

This is a detailed description of a complicated apparatus for testing drugs which are standardized by their action on the isolated uterus muscle such as ergot and pituitary extracts.

Pittenger and Mulford, Jr., "The Deterioration of U. S. P. and Fat-Free Tinctures of Digitalis," *JOURNAL A. PH. A.*, 1918, 7, p. 236.

The authors give details of results obtained from testing samples of digitalis tinctures prepared by different menstrua and aged for about 7 months. These show a remarkably high

rate of deterioration, in one case a loss in 7 months of about 70 percent. Their results seem to show that a fat free tincture prepared with 50 percent alcohol deteriorates the least.

Pilcher, "The Bio-Assay of Veratrum Viride," *Amer. Journ. of Physicians*, 1917, 44, p. 1.

The author proposes the use of frogs for assaying veratrum preparations.

Robinson and Wilson, "A Quantitative Study of the Effect of Digitalis on the Heart of the Cat," *Journ. of Exp. Pharm. and Phys.*, 1918, 10, p. 491.

The authors used the Cat Method of Assay and studied the action of digitalis on the heart. Among other facts developed is this—that the M. L. D. varied 100 percent, which coincides with results by some other authors.

Rogoff, "A Method for the Standardization of Thyroid Preparations," *Journ. of Pharm. and Exp. Therap.*, 1917, 10, 199.

The author suggests the action of thyroid material as a means of standardization. The effect is on the differentiation and growth, the more active the product the slower is growth and development.

Redonnet, "The So-called Titration of the Digitalis Preparations on Frogs," *Cor.-Bl. of Schweiz. Aertze*, 1917, 47, p. 974.

Roth, "The Activity of Wild American Digitalis," *Pub. Health Reports*, 1917, 32, p. 377.

Examination of digitalis from Oregon showed a high degree of toxicity compared with that commonly found on the market.

Salant, "The Pharmacology of the Oil of Chenopodium with Suggestions for the Prevention and Treatment of Poisoning," *Journ. Amer. Med. Ass'n*, 1917, 69, p. 2016.

The author determined the M. L. D. for a number of animals, showing by some experiments the action on circulation and respiration as well as on the digestive organs and the kidneys. He also demonstrated the value of a fatty oil such as olive, cocoanut or castor to minimize these effects.

Sellards and McIver, "The Treatment of Amebic Dysentery with Chaparro Amargosa," *Journ. of Pharm. and Exp. Therap.*, 1918, 11, p. 331.

These authors found an active constituent in Chaparro Amargosa, testing it not only for chemical and toxic properties but also for its action on the parasite of amebic dysentery.

Sollmann, "The Comparative Activity of Local Anesthetics," *Journ. of Pharm. and Exp. Therap.*, 1917, Nov.; 1918, Feb.

Five series of tests were carried out in comparing the action with other local anesthetics. By different methods, different ratios were obtained, showing that their action is not identical and that no one method will show the efficiency of an anesthetic. The tests were carried out on the motor and sensory nerves (isolated) of frogs, on frog's skin on the corner and intracutaneously on human subjects.

Spaeth and Barbour, "The Action of Epinephrin and Ergotoxin upon Single Physiologically Isolated Cells," *Journ. Pharm. and Exp. Therap.*, 1917, 9, p. 431.

Using the melanophores of *Fundulus heteroclitis*, this author demonstrated its value in standardizing adrenalin (epinephrin), the pigment cells contracting with a dilution of 1:50,000,000. Ergotoxin expands the pigment cells and thus demonstrates the equivalence between these and other smooth muscle cells.

Spaeth, "A New Method for the Standardization of Pituitary Extract," *Journ. Pharm. and Exp. Therap.*, 1918, 11, p. 209.

The method just described was applied to the standardization of pituitrin solutions. The action is a contraction apparently identical with that observed with dilutions of adrenalin. The test is proposed as a method for quantitative assay of pituitary extracts. No results are appended.

REPORT OF THE DELEGATES OF THE A. PH. A. TO THE NATIONAL WHOLESALE DRUGGISTS' ASSOCIATION *

As one of your delegates to the Annual Meeting of the National Wholesale Druggists' Association in Chicago last fall, I am pleased to report a cordial reception and disposition to co-operate in legislative matters. Mr. George W. Lattimer, of Columbus, Ohio, before reading his

* Presented at the Chicago meeting, A. Ph. A.

creditable and very valuable report of their Legislative Committee, expressed his joy in the selection of men to represent them in Washington who could be depended upon for correct information before Bureaus or Committees of Congress, backed by letters from members of their Committee resident at the principal State capitols.

This report will be of great interest to the legislative committees of this and other druggist associations, as it gives intelligent consideration to War Revenue Legislation, Bone-Dry Legislation, Harrison Narcotic Law, Testing of Imported Drugs, Drug Patents, Mailability of Poisons, Federal Child Labor Law, recently held as unconstitutional, Honest Paint Legislation, as indicated by bill introduced by Senator Kenyon of Iowa, Price Maintenance and the Stephens Bill, and other honest merchandising measures and statistics relating to the drug business in the various States.

Upon the conclusion of this report President Morrison recognized Mr. W. L. Crounse, their legislative correspondent, who had just arrived from Washington, in reference to the War Revenue Law to go into effect on that day (Oct. 3, 1917). Following his general remarks, we quote from page 399 of the printed Proceedings:

"President Morrison: The report of the Committee on Legislation is now open for general discussion.

"George H. Schafer: Mr. President and Gentlemen: I was one of the pioneer members of the Western Wholesale Druggists' Association; was on the Committee on Legislation when Mr. McKinley was chairman of the Ways and Means Committee.

"I today arise as a delegate of the American Pharmaceutical Association to commend the report just read and to briefly refer to our meeting at Louisville in 1874 (Proceedings, pages 545-550), when I proposed resolutions to petition Congress to remove the Liquor Dealers' License libel and other legislative evils that were hampering our profession and with increased membership ask Congress to abate such evils by pharmacists' license regulations to make a distinction between alcohol as sold by liquor dealers and alcohol used by the pharmacist. The idea was to make title distinction fundamental to tax exemption of alcohol for all legitimate uses of the licensed pharmacist and have the tax apply only to distilled spirits used for beverage purposes.

"In 1874 the Association felt they were not prepared to ask Congress for a differentiation as between the liquor dealer and the druggist, but such legislation is progressing, and through the instrumentality of the State pharmacy laws we are advancing to where this Association, the most influential of all, followed by the American Pharmaceutical Association, the National Association of Retail Druggists, and others, should endeavor to make a concerted effort to have these fundamentals adjusted and have a differentiation made between retail liquor dealers and registered pharmacists in the use of alcohol, especially so, when the Internal Revenue Law, just enacted, makes a partial but positive distinction as to distilled spirits not intended for beverage purposes.

"I will be glad to assist your Board of Control to perfect plans for the federation of all drug fraternities to unitedly petition Congress to now perfect such legislation as will exempt the Registered Pharmacist who complies with proper regulations from hanging up a liquor dealers' license or paying exorbitant taxes that should apply only to sales as a beverage."

Thereupon general discussion took place and many questions propounded, to which Mr. Crounse gave ready response and Secretary Holliday, preceding a suspension of this discussion, said:

"This information is very valuable, but there are many points which cannot be covered in a discussion of this character, and I want to say that just as soon as I return home from this convention I will go to Washington and Mr. Crounse and myself will work out all of these details to the best of our ability and secure all the information we can from the Internal Revenue Bureau, and we will then send out a bulletin covering every item, and do it as soon as possible."

It pays to have known personal representatives at seats of government to issue bulletins or reply to important correspondence relating to the drug trade, and all druggists' associations should make coöperative arrangements to support same.

Respectfully submitted,

GEO. H. SCHAFER,

Attested by C. P. VAN SCHAAK

H. M. WHELPLEY.

COUNCIL BUSINESS

COUNCIL MEETINGS.

SIXTH SESSION OF THE COUNCIL, 1917-1918.

(Concluded from p. 912, October issue.)

The following communication from the Section on Education and Legislation was presented:

"The Section on Education and Legislation recommends to the Council that a committee be appointed to study the question of the separation of drug stores into two classes—drug stores and prescription pharmacies and present to us at our next annual meeting a plan of separation that will cause the least amount of harm and the greatest amount of good to both."

In this connection, the following statement was appended by Chairman F. H. Freericks of the Section:

"I firmly believe that this separation is the only satisfactory solution to the problem and that the time is ripe for both parties to take the case to court and sue for divorce. No organization is better fitted to judge the case than the American Pharmaceutical Association; therefore, in conclusion, I would suggest that this Section recommend to the Council that a committee be appointed to study this question for a year and present to us at our next annual meeting a plan of separation that will cause the least amount of harm and the greatest amount of good to both members of the unhappy union."

On motion of Dr. F. E. Stewart, seconded by E. G. Eberle, the recommendation was adopted and the committee directed to be appointed by the Chairman of the Council.

Several matters referred by the Association to the Council were considered as follows:

(1) Appropriation of \$25 to Committee on Syllabus.

On motion of Jacob Diner, seconded by H. V. Arny, the appropriation was granted.

(2) Appropriation of \$10 for dues in American Metric Association.

On motion of H. V. Arny, seconded by W. B. Day, the appropriation was granted.

(3) Appropriation of \$150 for Joint Committee on Revised Nomenclature of Cultivated Plants.

On motion of H. V. Arny, seconded by Jacob Diner, the appropriation was referred to the Committee on Finance to report on later to the Council.

The question of cost of reprints of the Report of the Committee on Military Status of Pharmacists in the Government Service, ordered to be published by the second general session of the Association, was considered, and on motion of J. A. Koch, seconded by H. V. Arny, it was directed to be charged against the Miscellaneous Items of the Budget of Appropriations.

Treasurer Whippley discussed at length the desirability of converting certain funds of the Association into registered bonds of the Third Liberty Loan.

On motion of S. L. Hilton, seconded by Jacob Diner, the Treasurer was authorized to invest all or a part of the funds of the Life Membership Fund, the Centennial Fund and the Endowment Fund, amounting to \$16,000 (now deposited in the Boston Penny Savings Bank) into registered bonds of the Third Liberty Loan.

On motion of J. A. Koch, seconded by H. V. Arny, it was decided to invest the funds of the William Procter, Jr., Memorial Fund in the same manner. The fund amounts to over \$8,000.

Chairman Hopp announced the appointment of the Committee on Nominations for Committees of the Council to report at the first session of the Council for 1918-19 to be held on Saturday, August 17, 1918. The committee named was W. B. Day and J. W. England.

The recommendations of the address of Chairman F. H. Freericks, to the Section on Education and Legislation, and referred for action to the Council, were considered. These were as follows:

"What can American Pharmacy do to secure the future of the young pharmacist now in the Army and Navy? Let us be mindful of the fact that while most of them will return strong in body and mind, there will be some unfortunately crippled

and more or less disabled for life. We must have a place not only for every one that returns sound in body, but also for all who are more or less disabled. Fortunately, the trained pharmacist, though he be blind or without limb, can with proper help continue a useful man in pharmacy, to the end of his day. My subject might be elaborated upon in many different ways, and with much detail, but it occurs to me to be a needless loss of words, if I may have the privilege to submit a rough outline of what, in my judgment, should now be done by American Pharmacy and particularly by the American Pharmaceutical Association.

"1st. I would propose the appointment of an A. Ph. A. Advisory Committee for Soldier and Sailor Pharmacists.

"2nd. With the aid of Pharmaceutical Journals and business houses who come in touch with retail pharmacists, it should be the duty of such Committee to learn the name and address of every pharmacist now in the service.

"3rd. Through the same medium it should be the duty of such Committee to learn and card index every pharmacist who now reasonably anticipates that he will have a position open for a pharmacist returning from the War.

"4th. By the same means it should be the duty of said Committee to learn of all now conducting retail drug stores who anticipate that they will be ready to dispose of them to one of the returning pharmacists after the War, or who may have favorable partnership openings to offer at that time.

"5th. A complete directory should be secured of all pharmacists who believe that they will have some useful opening for those of the men who will return partly disabled.

"6th. The Committee should adopt proper means, in ample time, to inform every pharmacist serving in the Army and Navy of its work, and of readiness to be of service in their re-establishment.

"7th. Anticipating that the man now a registered pharmacist of California, may, on his return, find employment in New York, and that the man now a registered pharmacist in New York, may find employment in Illinois, it should be made possible under the direction of the National Association of Boards of Pharmacy, and where their authority does not reach, then by an amendment of the respective state laws, that every pharmacist returning from the service, registered in one state, desiring to locate within another, shall, within six months after honorable discharge, have the absolute right, on the strength of registration in his home state, to become registered in such other state.

"I most earnestly urge that the American Pharmaceutical Association can not and should not fail in this high duty. This brief outline of how the matter may be handled is, of course, only a suggestion, and doubtless the general outline can and will be greatly improved. Just another thought. A wonderful opportunity is presented to our colleges and schools of pharmacy. Among the thousands of young pharmacists there will be thousands who have had no college training, and who with a college training would add glory to American Pharmacy. These men as they return, without any definite vocational ties, will be situated as otherwise they never could be, to give at least a year of their time to college training. Doubtless they will need assistance in one form or another, but where there is a will this can be readily provided. Are our colleges and schools of pharmacy awake to the situation? Is it impossible to arrange a special course for these men and is it altogether out of the question to overlook the pre-requisites, if necessary, where the service has been of such special nature?

"American Pharmacy not only has a duty, but has an opportunity which it would be a pity to neglect."

The general principles of the above recommendations were approved and the details of carrying them into effect were, on motion, referred to a special committee to be appointed by the Chairman of the Council.

The communication from the Commercial Section, presented at the fifth session of the Council, on August 15, 1918, the consideration of which was deferred, was then taken up and discussed.

On motion of H. V. Army, seconded by Jacob Diner, the recommendations were approved and referred favorably to the National Drug Trade Conference for consideration and action.

Adjourned *sine die*.

J. W. ENGLAND, *Secretary*.

FIRST SESSION OF THE COUNCIL, 1918-1919.

The first session of the Council for 1918-19 was held at the Congress Hotel, Chicago, on Saturday, August 17, 1918, at 9:30 A.M., Chairman Hopp presiding.

Present: Messrs. H. V. Army, T. J. Bradley, Jacob Diner, Dr. A. R. L. Dohme, E. F. Kelly, J. W. England, J. G. Godding, S. L. Hilton, L. C. Hopp, Jeannot Hostmann, L. A. Seltzer, Dr. F. E. Stewart, F. J. Wulling, Charles E. Casjari, C. H. LaWall and E. G. Eberle.

The following application for membership was received and favorably acted upon:

No. 410. Albert Henry Perihard, Assistant Surgeon, U. S. Navy, Headquarters 6th Regiment, Great Lakes, Ill., rec. by H. M. Whelpley and W. F. Rudd.

The election of officers of the Council for 1918-19 was held, the following being elected

Chairman—Lewis C. Hopp.

Vice-Chairman—Samuel L. Hilton

Secretary—J. W. England.

The election of officers of the Association for 1918-19 was held, the following being elected

General Secretary—William B. Day.

Treasurer—Henry M. Whelpley.

Editor of the JOURNAL—Eugene G. Eberle.

Reporter on the Progress of Pharmacy—H. V. Army.

Local Secretary—Hugo H. Schaefer.

The report of the Committee on Nominations on Committees of Council for 1918-19 was presented, and on motion of Dr. A. R. L. Dohme, seconded by S. L. Hilton, was adopted. The committees of the Council are:

COMMITTEES OF THE COUNCIL.

Committee on Finance and Auditing Committee.

J. A. Koch, Chairman, Pittsburgh, Pa. Otto F. Claus, St. Louis, Mo.
G. M. Beringer, Camden, N. J.

Committee on Publication.

J. W. England, Chairman, Philadelphia, Pa. C. A. Mayo, New York, N. Y.
George M. Beringer, Camden, N. J. H. B. Mason, Detroit, Mich.
E. L. Newcomb, Minneapolis, Minn.

Ex-Officio Members—The Editor, Reporter on the Progress of Pharmacy, General Secretary and Treasurer.

Committee on Invested and Trust Funds.

Wm. B. Day, Chairman, Chicago, Ill. Frederick J. Wulling, Minneapolis, Minn.
E. G. Eberle, Philadelphia, Pa. H. M. Whelpley, ex-officio, St. Louis, Mo.

Committee on Centennial Fund.

A. R. L. Dohme, Chairman, Baltimore, Md. Wm. B. Day, Chicago, Ill.
J. A. Koch, Pittsburgh, Pa.

Committee on Transportation.

Caswell A. Mayo, Chairman, New York, N. Y. J. L. Lengfeld, San Francisco, Cal.
Wm. B. Day, Chicago, Ill. E. Floyd Allen, Minneapolis, Minn.
Lewis C. Hopp, Cleveland, Ohio. F. C. Godbold, New Orleans, La.
H. M. Whelpley, St. Louis, Mo. W. S. Elkins, Jr., Atlanta, Ga.
Charles G. Merrell, Cincinnati, O. C. Herbert Packard, Boston, Mass.
E. F. Kelly, Baltimore, Md. Chas. J. Clayton, Denver, Colo.

The General Secretary and Local Secretary, ex-officio members.

Committee on National Formulary.

Treasurer Whelpley discussed the question of delinquency of dues by members, and on motion of W. B. Day, seconded by T. J. Bradley, the Treasurer was authorized to use his discretion in continuing the delinquents of 1918 as members, but in no case beyond the end of the present fiscal year.

Jeannot Hostmann stated that the House of Delegates had approved of the suggestion of "combination dues" for members of the A. Ph. A. and the State Pharmaceutical Associations, referred to it by the Council, and had instructed the delegates present from the State Associations to present the matter to the Associations for consideration at their next annual meeting.

Adjourned.

A. PH. A. COUNCIL LETTER NO. 1.

PHILADELPHIA, September 4, 1918.

TO THE MEMBERS OF THE COUNCIL:

The following is a list of the members of the Council for 1918-1919:

MEMBERS OF THE COUNCIL 1918-19.

Army, H. V., 115 W. 68th Street, New York, N. Y.
 Beal, James H., 801 W. Nevada Street, Urbana, Ill.
 Beringer, George M., 5th and Federal Streets, Camden, N. J.
 Bradley, Theo. J., Mass. College of Pharmacy, Boston, Mass.
 Caspari, Charles E., 2108 Locust Street, St. Louis, Mo.
 Cook, E. Fullerton, 145 North 10th Street, Philadelphia, Pa.
 Day, Wm. B., 701 South Wood Street, Chicago, Ill.
 Dohme, Alfred R. L., Pratt and Howard Streets, Baltimore, Md.
 Dye, Clair A., Ohio State Univ., Columbus, Ohio.
 Eberle, Eugene G., 253 Bourse Building, Philadelphia, Pa.
 Eldred, Frank R., 3325 Kenwood Avenue, Indianapolis, Ind.
 England, Joseph W., 415 N. 33rd Street, Philadelphia, Pa.
 Fennel, C. T. P., 614 W. Court Street, Cincinnati, Ohio.
 Fuller, Oliver F., 540 W. Randolph Street, Chicago, Ill.
 Fuller, H. C., 19th and B Streets, N. W., Washington, D. C.
 Gathercoal, E. N., 701 South Wood Street, Chicago, Ill.
 Godding, John G., 278 Dartmouth Street, Boston, Mass.
 Hemm, Francis, 2108 Locust Street, St. Louis, Mo.
 Hensel, Samuel T., 351 Mercantile Building, Denver, Colo.
 Hilton, Samuel L., 1033 22nd Street, N. W., Washington, D. C.
 Hopp, Lewis C., 1104 Euclid Avenue, Cleveland, Ohio.
 Hostmann, Jeannot, 115 W. 68th Street, New York, N. Y.
 Kantrowitz, Hugo, 600 W. 178th Street, New York, N. Y.
 Kelly, E. F., Lombard and Green Streets, Baltimore, Md.
 Koch, J. A., Bluff and Pride Streets, Pittsburgh, Pa.
 LaPierre, E. H., 80 River Street, Cambridge, Mass.
 LaWall, C. H., 39 South 10th Street, Philadelphia, Pa.
 Mason, Harry B., P. O. Box 484, Detroit, Mich.
 Mayo, Caswell A., 66 West Broadway, New York, N. Y.
 Nitardy, F. W., 66 Orange Street, Brooklyn, N. Y.
 Rochr, Clarissa M., University Hospital, San Francisco, Cal.
 Schaefer, Hngo H., 115 West 68th Street, New York, N. Y.
 Seltzer, L. A., 32 Adams Street, W., Detroit, Mich.
 Snow, Clyde M., 701 South Wood Street, Chicago, Ill.
 Stewart, Francis E., 11 W. Phil-Elena Street, Philadelphia, Pa.
 Terry, R. W., Groveport, Ohio.
 Whelpley, Henry M., 2342 Albion Place, St. Louis, Mo.
 White, William R., 314 Hancock Street, Nashville, Tenn.
 Wilkerson, J. A., 4th and Washington Streets, St. Louis, Mo.
 Wulling, F. J., University of Minnesota, Minneapolis, Minn.
 Rudd, Wortley F., 1716 Grove Avenue, Richmond, Va.
 Total number, 41.

The Committees of the Council elected for 1918-1919 are printed under **First Session of the Council for 1918-1919** on pp. 1006 and 1007 of this issue.

J. W. ENGLAND, *Secretary*.

A. PH. A. COUNCIL LETTER NO. 2.

PHILADELPHIA, PA., September 23, 1918.

TO THE MEMBERS OF THE COUNCIL:

The following communication has been received:

"TO THE COUNCIL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

GENTLEMEN:

"At the Chicago meeting the Council referred to the Committee on Finance the question of increasing the salaries of the officers of the Association on account of the rising cost of clerical and other work.

"The Committee has very carefully considered the present income and fixed charges of the association and arrived at the conclusion that it would be extremely unwise to increase these fixed charges at the present time. In view, however, of the urgency of the request of the Treasurer for aid at the present time to meet the increased cost of operation of his office, the Committee feels that some action for the relief of the Treasurer should be taken and recommends that an emergency appropriation of two hundred and fifty dollars (\$250.00) be made to meet the increased clerical expenses of the Treasurer's office during the year commencing August 15, 1918.

"The Committee desires it to be clearly understood that this is not an increase of salary, but only an appropriation made to enable the Treasurer to meet the increased cost of clerical aid in his work caused by the war conditions.

"With respect to the recommendation of the Committee on Publication that the salary of the Editor be increased two hundred and fifty dollars (\$250.00) per annum, the Committee recommends that this be granted because of the increased cost of living and the fact that the position is one requiring all of the time of the incumbent.

Respectfully submitted,

J. A. KOCH, *Chairman,*

GEORGE M. BERINGER,

OTTO F. CLAUS.

Committee on Finance."

What is the wish of the Council?

General Secretary Day offers the following resolutions. They have been suggested by Dr. C. C. Pierce, Assistant Surgeon General, Division of Venereal Diseases, Bureau of Public Health Service.

"WHEREAS, It is a matter of medical record that venereal diseases are the greatest single cause of disability in the Army; and

"WHEREAS, It has been demonstrated that the great majority of such diseases are brought into the Army from civilian life, having been contracted before enlistment; and

"WHEREAS, It has been demonstrated that one of the greatest contributing factors to the continued existence and spread of venereal infection among the civilian population is attempted self-treatment by individuals without proper medical diagnosis and direction.

"Therefore be it resolved, That the Council of the American Pharmaceutical Association, appreciating the seriousness of venereal diseases among the armed forces of the United States, and desirous of doing everything in its power to assist the Government in the war emergency, pledges the best efforts of the organization in cooperating with the program of the United States Public Health Service to reduce the venereal disease scourge.

"And be it further resolved, That this Association recommends to the retail druggists of the United States that they discourage attempted self-treatment by refusing to sell to infected people who are carriers of venereal disease, patent proprietary remedies compounded for such self-treatment, and by directing such carriers to competent physicians, venereal clinics or boards of health for scientific care, so as to hasten their cure and reduce the danger of infection to civilians and to soldiers and sailors of the United States."

(To be concluded in December issue.)

EDITORIAL NOTES

Editor: H. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

SERUMS AND VACCINES IN INFLUENZA

In an editorial of the *Journal* (A. M. A., November 2, 1918), it is stated that up to the present time there is no specific means for the cure of influenza, and no specific vaccine or vaccines for its prevention.

TOXICITY OF CERTAIN ORGANIC ARSENIC COMPOUNDS AND TOXICITY OF EMETINE HYDROCHLORIDE.

Bulletin No. 113 of the Hygienic Laboratory, U. S. Public Health Service, reports on experimental investigations of the toxicity of certain organic arsenic compounds by George B. Roth, and on the toxicity of emetine hydrochloride, with special reference to the comparative toxicity of various market preparations by Gleason C. Lake.

The first part of the first report deals with Salvarsan made in America and the second with Neosalvarsan and Nediarsenol and covers four pages.

The general conclusions of the reporter are:

1. That no marked variation in toxicity was found in either German or American salvarsan, as shown by intravenous administration to rabbits and rats.

2. Individual variation in susceptibility to salvarsan is quite marked in both rabbits and rats.

3. The toxicity for rabbits and rats closely parallels the arsenic content of the salvarsan preparations examined.

4. Neosalvarsan preparations were found to be less toxic for rabbits and rats than the salvarsan preparations examined.

The author states that the work reported is to be followed by a more detailed examination of a larger number of samples and a consideration of some of the questions developed are now being made subjects of experimental study.

Gleason C. Lake acknowledges indebtedness to Dr. Carl Voeltlin, of the Hygienic Laboratory for many valuable suggestions and criticisms.

The results indicate a widely variable individual susceptibility with the same preparation of emetine hydrochloride in rabbits, white rats and white mice. The author states that Rowntree and Levy's work shows that the same holds true in cats and dogs, and concludes that the range of susceptibility to emetine poisoning varies in man, and perhaps more so, in so far as it has to do with cases of amoebic dysentery, where there is always present a pathological condition, varying in intensity.

ACUTE POISONING FROM 5 GRAINS OF ASPIRIN.

Dr. Edmund P. Shelby, New York City Hospital, reports on a case of poisoning from the administration of five grains of aspirin. The subject was a strong, vigorous woman. The toxic effects followed in less than an hour after taking the medicine and persisted for several hours. The report states that unusual susceptibility to the action of salicylates has often been noted, but no case is recalled wherein so small a dose produced such marked symptoms.

INDIANA STATE MEDICAL JOURNAL COMMENTS ON THE EDMONDS BILL.

While the editorial of the October issue *Indiana State Medical Journal* indorses the Edmonds Bill, a fear is expressed that, unless proper provisions are made, "unscrupulous manufacturers will foist their wares upon the Army." Also the following lines occur in the editorial: "It is nothing short of a disgrace to note that at the present time a few worthless proprietaries, through the influence of mercenary manufacturers' have been accepted and included as part of the medical supplies of the Army."

The latter can only indicate that the medical men of the Army have permitted these preparations to be included, and the first quotation shows where the trouble is, namely, lack of confidence in the sincerity of pharmacists. It is the old story. Pharmacists and physicians should know each other better and work to-

gether for the uplift of pharmacy, for the benefit of mankind. Carping criticism and lack of confidence will never do it.

The Edmonds Bill provides for pharmacists, as such; the fact that drug stores handle "patient medicines" has nothing whatever to do with them. Though they be pharmacists they are also men.

REQUIREMENTS FOR S. A. T. C. LOWERED

Requirements for entrance into the Student Army Training Corps at U. of P. have been reduced by an order of the War Department issued through the Committee of Education and Special Training. Inductions under previous orders were limited to men who presented sufficient college entrance credits and who applied for admittance before October 30.

Now all men desiring to attend any of the student army training colleges may do so, regardless of the fact that they have not quite enough preparatory work to meet the college entrance requirements, providing they have had vocational, military or business experience which in the estimation of the commanding officials will qualify them as officer material.

PHARMACISTS COMMENDED FOR GAL- LANT CONDUCT IN BATTLE.

Secretary Daniels, of the Navy, has commended seven pharmacists and two hospital apprentices now on service with the Sixth Regiment of Marines, A. E. F., for gallant conduct under fire in battle. Those cited are:

Oscar S. Goodwin, North Carolina; Percy V. Templeton, Georgia; Emmett Clive Smith, Georgia; Edmund P. Groh, Iowa; Leveque L. Whalen, Washington; Ursher Lee Fifer, Virginia; Horatio D. Gates, North Dakota; John Humphrey Marks, Oklahoma; Clyde A. Kindle, California; Bernard W. Herrmann, Jr., Ohio.

THE NEED OF PUBLICITY FOR PHARMACY.

British Pharmacists are planning a general campaign of education to inform the Government departments and the public generally, relative to pharmacy. In an article on the subject in the *Chemist and Druggist* ancient the propaganda use is made of a quotation from an address by an ex-President of the A. Ph. A., Dr. Oscar Oldberg, in 1911, when he said:

"I venture to call upon all pharmacists present to begin here and now a vigorous campaign to compel full recognition of the

great service rendered to mankind by the pharmacist. The public is ignorant of the fact that the pharmacist is the sole agent to whom must be entrusted the enforcement of so much of the public health laws as relates to the drugs used in the practice of medicine. Let us try to remove that ignorance. It is our right and duty to demand respect for the service rendered by our craft."

We have just as much need of this kind of publicity for pharmacy as they have in Great Britain. There unwarranted charges of profiteering have been made, which will be answered. Here we frequently have aspersions cast upon pharmacy and pharmacists that should be refuted. The public has not the proper conception of pharmacy nor is a very great interest displayed for it; if it had been otherwise, a pharmaceutical corps would have been part of the Medical Department of the Army before now. A good Republican once said, "I have watched —— and I have never discovered him in any wrongdoing, and he is a Democrat!" There are medical men so possessed of self-righteousness that they think none of their profession can do wrong, and every pharmacist is to be distrusted. Let us get closer; we should know each other, we have the same interests and purposes in common. Surely the liberal-minded men know that pharmacists are sincere in their desire for betterment, and they also know that disinterestedness is not universal among medical men. It is an easy matter to "break down"—we prefer to "build up" and not only for the good of professions but for humanity.

Let the propaganda by local, State and National associations proceed with a purpose of education, to tell the truth, and impress the value of pharmacy. In each locality the work will be somewhat differently outlined, but the purpose should be to advance the drug business and the cause of pharmacy. The address of Chairman J. C. Peacock of the Section on Practical Pharmacy and Dispensing, A. Ph. A., is worthy of careful study.

THE CHINESE OPIUM SCANDAL.

The opium trade is one of the causes of the split between North and South China.

Production and importation of opium were forbidden in 1911, and the law came into full operation on April 1, 1917, when the opium syndicate found it had 1,576 chests of opium on hand. President Feng Kuo-Chang con-

tracted to buy this opium for the Chinese Government, which was to pay 8,200 taels per chest, but the syndicate was to get only 5,700 taels. The difference was to go into the pockets of the President of China and his associates.

It now appears that the Peking government afterwards made a new deal with the opium syndicate and resold the opium on hand to another syndicate in which some prominent Japanese have an interest. The old opium syndicate got about \$10,000,000 for its stock of opium, and the President and members of the Peking government took as their share about \$3,000,000 and a loan of \$5,000,000 from the Japanese financiers.—From an editorial in *N. Y. Commercial*.

WAR PROFITS.

In a recent discussion on War Profits, Chas. J. Lynn, President of the American Drug Manufacturers' Association, furnished much food for thought when he said:

"War profits in my opinion are those which are the direct result of the war, such as those made by manufacturers who furnish directly or indirectly material of whatever kind used in the prosecution of the war, and only that portion of the profit made on such material is war profit. In the case of the average mercantile house, they will not know what their actual profits have been during the period of the war until after the war is over and they have passed through a readjustment period and are able to strike an average, and in my opinion the average thus found will in many cases be less than the normal average for the pre-war period.

"Many concerns have shown a considerable increase in profits as expressed in dollars and cents, due to increased business resulting from the general prosperity of the country without, however, having increased their normal percentage of profit even a small fraction. Other concerns not supplying materials for use in the prosecution of the war may thus far have shown an abnormal profit both in dollars and cents as well as in percentage due to the very large and rapid increase in the value of merchandise on hand. But this profit must later in practically every case be offset by the very large and rapid decline in stock values the moment peace is declared.

"I think that in determining just what is a war profit these conditions should be taken into consideration."

PAPER CONSERVATION.

November 11 to 16 was named as Paper Economy Display Week, and the Paper Economy Section of the War Industries Board asked that every retail merchant use a window display setting forth the necessity for paper economy and bringing to the attention of the public that all merchants are directed to discontinue the wrapping of package merchandise. This is a matter in which every druggist should be interested, from an economic standpoint. The Paper Economy Section suggested window displays during this week, and they are prepared to suggest slogans and other material which will help in the preparation of window cards. The Section is also desirous of securing photographs of good displays.

We heartily endorse every movement for economy in every possible direction. Unfortunately, however, there are many who disregard the necessity of economizing and all too frequently we see much waste of the very things that the conscientious citizen economizes in, thus, for example, it has been under advisement to construct a papier mache track for an international six-day bicycle race in New York. In this construction 48,000 square feet of material would be required. This is only one instance in which there is disregard of conservation. There is also much printed matter that consumes a great deal of paper and has really little general value. A movement is on foot to standardize the size of catalogues. This is a splendid move and will undoubtedly not only conserve paper but also make the filing of the catalogues more convenient. This proposition is discussed in the Proceedings of the Catalogue Conference held in Chicago May 22. The Proceedings are published by Poole Brothers, Chicago, from whom a copy of the report may be had.

ELIMINATE RETURNS OF MERCHANDISE.

The following request has been made by the War Industries Board:

"The Conservation Division of the War Industries Board has issued a special appeal to retailers, wholesalers and manufacturers in every industry and trade to coöperate with each other for the elimination of all unjustifiable returns of merchandise. This request is not intended to interfere with the return of merchandise when there has been an error on the part of the seller as to price, style, or quality, misinterpretation of order, unauthorized

substitution, or when merchandise is inferior or not up to sample. When goods are delivered as bought, however, they should not be returned to the seller. If merchandise is to be returned because of substitution or error of any kind, notice should be given by the purchaser within ten days after the receipt of the goods that return is intended.

"Ample time should, of course, be allowed for explanation or proffered adjustment. Salesmen should make definite sales only. In their

travels, furthermore, they can be of particular assistance by enlisting the coöperation of their customers for careful selection and purchase of merchandise so that returns will be unnecessary. Whole-hearted compliance with this request in the spirit of husbanding our resources and eliminating waste of transportation, materials and labor will be a substantial contribution by the merchants and manufacturers of the country to our general welfare and the success of the war program."

OBITUARY.

FREDERICK E. NIECE.

Frederick E. Niece, Superintendent of the Claremont Laboratories, New York City, died October 26 at his home in Queens Village, Long Island. Mr. Niece contracted influenza while experimenting to obtain a preventative serum for this disease. He was also preparing a lecture on the subject, to be delivered at the Cooper Union some time during this month. Mr. Niece was 43 years old, a native of Scranton, Pa., and held degrees from Cooper Union and the Brooklyn College of Pharmacy. He was a frequent contributor to various Sections of the American Pharmaceutical Association. He joined the American Pharmaceutical Association in 1903.

THOMAS LATHAM.

Thomas Latham, a prominent pharmacist of New York City, died September 24. Mr. Latham had been in poor health for several years, on which account he sold his drug store at Third Ave. and Seventy-fifth Street some time ago. Mr. Latham had established this store about thirty years ago, and previous to that time had been connected with Eimer and Amend. Mr. Latham was active in pharmaceutical organizations and was one of the founders of the Manhattan Association and also an officer. He was President during two years of the New York County Pharmaceutical Association, and an active member of the American Pharmaceutical Association, which he joined in 1900. The deceased is survived by a sister.

JESSE D. HODGES.

Jesse D. Hodges, of Little Rock, Arkansas, and President of the Arkansas Association of Pharmacists, died October 15, of influenza. Mr. Hodges joined the American Pharmaceutical Association in 1915.

GEORGE P. HEMM.

George P. Hemm, oldest son of Professor and Mrs. Francis Hemm, of St. Louis, died at his home in Hayes, Kansas, October 11. Dr. Hemm was a graduate of the St. Louis College of Pharmacy and of the St. Louis University Medical School.

ALBERT HENRY HEIDBREDER.

Albert Henry Heidbreder, of Quincy, Illinois, a graduate of the University of Illinois School of Pharmacy, Class of 1899, and a member of the firm of Heidbreder Bros. & Co., who operate several drug stores in Quincy, died at his home recently. He leaves a widow and a young son. He joined the American Pharmaceutical Association in 1905.

W. B. D.

CARL WILLIAM LUTZ.

Carl William Lutz, a prominent business man of Ottawa, Ill., died October 20, 1918, of pneumonia after a brief illness. Mr. Lutz was born in Ottawa June 10, 1887, and educated in the public school and high school of his native city. In 1910 he graduated from the University of Illinois School of Pharmacy, and after spending one year in drug stores in Chicago he entered upon his course in medicine at the College of Medicine of the University of Illinois, from which he was graduated in 1915. Though licensed to practice medicine, he was called to pharmacy again by the death of his father, C. J. Lutz, in July 1915, and since that date he successfully managed the drug store that he inherited from his father in Ottawa. In 1917 Mr. Lutz was appointed a member of the Board of Pharmacy examiners by Governor Lowden and served up to the time of his demise. In 1915 he married Miss I. M. Berg, of Chicago, to whom one child was born, Carl Frederick, now three

months old. Mr. Lutz joined the American Pharmaceutical Association in 1917 and was in attendance at the Chicago meeting. He

was very highly esteemed and was regarded as one of the successful business men of his community.
W. B. D.

SOCIETIES AND COLLEGES.

NATIONAL COMMITTEE ON THE PHARMACEUTICAL SYLLABUS.

BULLETIN XIX.

To the Members of the National Committee on the Pharmaceutical Syllabus:

I hand you herewith the financial statement of the Committee:

Receipts.

| | | |
|---------|------------------------------------------------------|----------------|
| 1917. | | |
| Oct. 4 | T. J. Bradley, retiring Treasurer..... | \$23 95 |
| Oct. 25 | American Pharmaceutical Association..... | 25 00 |
| Oct. 29 | American Conference of Pharmaceutical Faculties..... | 25 00 |
| Nov. 5 | National Assn Boards of Pharmacy..... | 25 00 |
| | Sale of 3 copies of the Syllabus..... | 3 85 |
| | | <hr/> \$102 80 |

Disbursements.

| | | |
|---------|--------------------------------------------|----------------|
| 1917. | | |
| Oct. 12 | Freight from Boston and cartage..... | \$ 2 80 |
| Oct. 12 | Typewriting for Bulletins XIII XIV-XV..... | 3 00 |
| Oct. 29 | Spatula Publishing Co., supplies..... | 12 75 |
| Nov. 2 | 100 3c. postage stamps..... | 3 00 |
| Dec. 7 | T. J. Bradley, miscellaneous expense..... | 9 00 |
| | | <hr/> \$30 55 |
| 1918. | | |
| Aug. 6 | Cash on hand..... | 72 25 |
| | | <hr/> \$102 80 |

There are now in the hands of the Secretary-Treasurer about one hundred and ten copies of the Syllabus.

Respectfully,

CLYDE M. SNOW,
Secretary-Treasurer.

Examined and found correct, August 14, 1918.

GEO. C. DIEKMAN,
Auditing Committee.

CHICAGO, ILL.,
Aug. 6, 1918.

BULLETIN XX

Minutes of the meeting of the Committee held at the Congress Hotel, Chicago, Illinois, August 14, 1918, Chairman T. J. Bradley presiding.

Present: Messrs. W. C. Anderson, T. J. Bradley, John Culley, G. C. Diekman, E. G. Eberle, W. G. Gregory, J. A. Koch, W. H. Rudder, H. H. Rusby, C. M. Snow.

The Chairman presented his report in which he discussed the following matters of interest to the Committee:

Revision of the introductory matter of the Syllabus.

Make the Syllabus a true syllabus and in no way a compend.

Definitions in the Syllabus.

Lists of text and reference books in the Syllabus.

Might a chapter on "Model Questions" in the Syllabus be of value to members of boards of pharmacy?

Should large and small type be used in the Syllabus to indicate required and elective parts of subjects?

Shall the definition of the word "pharmacology" be changed to conform to medical usage?

Moved by H. H. Rusby, seconded by J. A. Koch, that the sub-Committee reports on revision be sent to the Chairman who will submit them by mail to the several members. Carried.

Moved by W. G. Gregory, seconded by W. C. Anderson, that the introductory chapters of the Syllabus be revised by the Chairman. Carried.

Moved by J. A. Koch, seconded by John Culley, that a list of pharmaceutical terms with definitions be included in the Syllabus as a glossary. Carried.

Moved by W. G. Gregory, seconded by W. H. Rudder, that the Secretary make a list of terms to be defined and submit such list to all members of the Committee for suggestions and revision. Carried.

Moved by J. A. Koch, seconded by W. G. Gregory, that lists of text and reference books be eliminated from the Syllabus. Carried.

The question of including a chapter in the Syllabus on Model Questions was discussed at some length. It was the sense of the Committee that such a chapter should be included.

Moved by John Culley, seconded by G. C. Dickman, that the coöperation of officers of the Association of Boards of Pharmacy be invited in the preparation of the chapter on Model Questions. Carried.

Moved by W. G. Gregory, seconded by H. H. Rusby, that the major or required exercises of the Syllabus be printed in large type and the minor or optional exercises be printed in small type. Carried.

Moved by W. G. Gregory, seconded by H. H. Rusby, that the definition of the word "pharmacology" be continued as now given in the Syllabus. Carried.

The Secretary-Treasurer presented his report. It was moved and seconded that the report be received and that it be audited by G. C. Dickman. Carried. (This report is circulated as Bulletin XIX.)

The report of the sub-committee on Materia Medica was presented by H. H. Rusby. Dr. Rusby recommended that the study of botany should be divided into two groups, *viz.*, Gross Structure and Microscopical Structure. This recommendation was adopted.

The report of the sub-committee on Chemistry was presented by J. A. Koch.

The report of the sub-committee on Pharmacy was presented by W. H. Rudder.

Chairman Bradley presented the results of a study of the subjects included by various colleges in a graduate course of one year leading to the degree of Pharmaceutical Chemist after the customary two-year course. Catalogues of more than sixty colleges of pharmacy were examined and it was found that thirty-five offer such a graduate course. Several colleges which are departments of state universities send their students to other departments of the universities for very diverse subjects, some of which have little or no connection with pharmacy. The subjects included in the various courses were classed under the following four heads, the numbers being the number of schools offering such subjects, from a total of thirty-five schools:

Subjects in the department of Materia Medica: Bacteriology, 26; advanced microscopy and micro-analysis, 13; advanced pharmacognosy, 9; toxicology, 9; advanced pharmacology, 6; physiology, 6; hygiene, 3; physiological testing, 3; etc.

Subjects in the Department of Chemistry: Food and drug analysis, 21; pharmaceutical assaying, 20; quantitative analysis, 18; advanced organic chemistry, 17; chemical technology, 9; mineralogy, 9; physiological chemistry, 9; physics, 5; etc.

Subjects in the Department of Pharmacy: Manufacturing pharmacy, 10; dispensing, 10; commercial pharmacy, 6; etc.

Miscellaneous subjects: Modern languages, 8; electives from university courses, 5; mathematics, 3; English, 2; etc.

Moved by W. G. Gregory, seconded by J. A. Koch, that 750 hours be required as a minimum for the third year course. Carried.

Moved by G. C. Dickman, seconded by W. C. Anderson, that Bacteriology be a required subject in the third year course. Carried.

Moved by J. A. Koch, seconded by W. C. Anderson, that Advanced Analytical Chemistry be a required subject in the third year course. Carried.

Moved by W. C. Anderson, seconded by G. C. Dickman, that Advanced Manufacturing Pharmacy be a required subject in the third year course. Carried.

Moved by H. H. Rusby, seconded by W. G. Gregory, that 75 hours of Bacteriology be the minimum requirement for this subject in the third year course. Carried.

Moved by J. A. Koch, seconded by G. C. Dickman, that 300 hours be the minimum requirement in Advanced Analytical Chemistry in the third year course. Carried.

Moved by W. C. Anderson, seconded by G. C. Dickman, that 100 hours be the minimum requirement in Advanced Manufacturing Pharmacy in the third year course. Carried.

The matter of Elective Subjects was then discussed. It was the sense of the Committee that it might with propriety designate Elective Subjects in the various departments.

Moved by H. H. Rusby, seconded by W. G. Gregory, that Micro-Analysis, Advanced Botany, and Physiological Testing be Elective Subjects in the department of Materia Medica. Carried.

Moved by J. A. Koch, seconded by G. C. Dickman, that Advanced Organic Chemistry, Chemical Technology, and Urine Analysis be Elective Subjects in the department of Chemistry. Carried.

Moved by W. G. Gregory, seconded by W. H. Rudder, that Dispensing and Pharmaceutical Jurisprudence be Elective Subjects in the department of Pharmacy. Carried.

Moved by W. C. Anderson, seconded by G. C. Diekman, that the Committee adjourn subject to the call of the Chairman. Carried.

CLYDE M. SNOW,
Secretary-Treasurer.

BULLETIN XXI

BOSTON, MASS., October 10, 1918.

The proposed revision of the section on Chemistry, as prepared by the sub-committee on that subject, has been sent to all members of the Committee, and the revisions of the sections on Pharmacy and Materia Medica will be sent out soon. All members of the Committee are asked to read these sections carefully as they are received, and to send suggestions and criticisms to the Chairman to be considered during the final revisions of the section, before they are published. The mimeographed sheets of the revised sections should be preserved for reference until revised sets are distributed.

The Committee now has the following membership:

FROM AMERICAN PHARMACEUTICAL ASSOCIATION.

Term expires.

- 1919 Edwin L. Newcomb, University of Minnesota School of Pharmacy, Minneapolis, Minn.
- 1920 Eugene G. Eberle, 253 Bourse Bldg., Philadelphia, Pa.
- 1921 Harry B. Mason, P. O. Box 484, Detroit, Mich.
- 1922 George M. Beringer, 501 Federal St., Camden, N. J.
- 1923 Henry H. Rusby, 115 West 68th St., New York, N. Y.
- 1924 Willis G. Gregory, 125 Bedford St., Buffalo, N. Y.
- 1925 William H. Rudder, Salem, Indiana.

FROM AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES.

- 1919 Clement B. Lowe, 145 North Tenth St., Philadelphia, Pa.
- 1920 William C. Anderson, 315 Greene Ave., Brooklyn, N. Y.
- 1921 Julius A. Koch, Bluff and Pride Sts., Pittsburgh, Pa.
- 1922 Theodore J. Bradley, 179 Longwood Ave., Boston, Mass.

- 1923 Clyde M. Snow, 701 South Wood St., Chicago, Ill.
- 1924 Albert Bolenbaugh, Richmond, Va.
- 1925 Edsel A. Ruddiman, Vanderbilt University, Nashville, Tenn.

FROM NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

- 1919 George C. Diekman, 115 West 68th St., New York, N. Y.
- 1920 Mason C. Beebe, 75 Church St., Burlington, Vt.
- 1921 John Culley, 2479 Washington Ave., Ogden, Utah.
- 1922 Ellis F. Faulkner, Delton, Mich.
- 1923 Charles H. Skinner, Windsor, Vt.
- 1924 Otto W. Osterlund, 46th St. and Baltimore Ave., Philadelphia, Pa.
- 1925 George W. McDuff, 2712 Magazine St., New Orleans, La.

E. A. Ruddiman and G. W. McDuff are hereby appointed as members of the sub-committee on Chemistry to fill existing vacancies.

Corrected list of members of sub-committees:

MATERIA MEDICA.

H. H. Rusby, *Chairman.*
M. C. Beebe.
G. M. Beringer.
John Culley.
E. F. Faulkner.
C. B. Lowe.
E. L. Newcomb.

CHEMISTRY.

J. A. Koch, *Chairman.*
T. J. Bradley.
E. G. Eberle.
G. W. McDuff.
O. W. Osterlund.
E. A. Ruddiman.
C. H. Skinner.

PHARMACY.

W. H. Rudder, *Chairman.*
W. C. Anderson.
Albert Bolenbaugh.
G. C. Diekman.
W. G. Gregory.
H. B. Mason.
C. M. Snow.

(Signed) THEODORE J. BRADLEY.
Chairman.

THE PHARMACIST AND THE LAW.

U. S. P. LIMITATION REMOVED FROM
T. D. 2,760.

Treasury Decision 2,760 revised, T. D. 2,576 and the paragraph which has now been amended read:

"Medicaments.—As the minimum dosage each liquid ounce of the completed preparation must carry in it approximately an average U. S. P. dose for an adult of some drug or drugs of recognized therapeutic value, either singly or in compatible combination."

"U. S. P." has been eliminated; without this modification it would have been unlawful to use any new drug which might be discovered in the manufacture of an alcoholic medicinal compound without the payment of the special tax, because such drug would not be U. S. P.

SACCHARIN STILL AN ADULTERANT.

Use of saccharin in foods still is regarded as an adulteration under the Food and Drugs Act by the Department of Agriculture. Requests for reversal, or at least reconsideration of an old ruling on this subject is denied by the department. It is held saccharin, as a substitute for sugar, reduces the food value, and persistent use of it is likely to impair digestion.

BECAUSE OF INFLUENZA PRESCRIPTIONS FOR NARCOTICS MAY BE
REFILLED.

Because of the spread of the Spanish influenza epidemic and the difficulty in obtaining immediate medical attention, the collector of internal revenue of the New York port has received notice of the modification of the narcotic laws, whereby prescriptions containing morphine, codeine or heroine may be refilled. The notice follows:—

INTERNAL REVENUE.

Refilling Narcotic Prescriptions. Modifying Article II of Regulations No. 35.
To Collectors of Internal Revenue and Others Concerned:—

Owing to the extent of the epidemic of Spanish influenza now prevailing in this country and consequent difficulty of persons in getting immediate medical attention and medicaments upon prescriptions issued by physicians, the provisions of Article II of regulations are modified as follows:—

Prescriptions calling for morphine, codeine or heroine which are written by registered

practitioners for patients suffering from Spanish influenza and any pulmonary or bronchial affections, may, until further notice, be refilled, provided that at the time of issuance by physicians instructions are noted in the body of such prescriptions, "Repeat if necessary," and the druggist filling and refilling the same shall note thereon each and every date upon which such prescription is refilled.

DANIEL C. ROPER,

Commissioner of Internal Revenue.

Approved October 22, 1918.

L. S. ROWE,

Acting Secretary of the Treasury.

COLGATE & CO. INDICTMENT DIS-
MISSED.

Holding that the indictment failed to charge any offense, either in restraint of trade and commerce under the provisions of the Sherman Anti-Trust Law or under any other law of the United States, Judge Edmund Waddill, Jr., in the Federal District Court sustained the demurrer and quashed the indictment in the case of the United States against Colgate & Co., charging violations of the Sherman Anti-Trust Law.

A. Leo Everett, counsel for N. W. D. A., has commented on the decision as follows:—

"Colgate & Co. adopted the practice of selling its goods with the information to the purchaser as to the price at which they should be resold by him. The purchaser at the same time was informed that if he failed to maintain the price Colgate & Co. would refuse to have further dealings with him. While this practice did not involve a contract, its effect upon price maintenance has been as efficacious as if a contract had been entered into. The legality of the method thus adopted has been completely sustained by Judge Waddill. The decision is all the more significant because it follows upon a series of injunctions issued by the Federal Trade Commission prohibiting the use of such methods. Of course, the statute creating the Federal Trade Commission gives it power to enjoin not only acts prohibited by law, but practices which it may consider 'unfair.' The Federal Trade Commission's rulings, however, are based, in part, at any rate, on findings that such practices are contrary to law. As to such findings, the Federal Trade Commission has been overruled, and the decision of the court is paramount. The Federal Trade Commission may, perhaps, continue to

grant such injunctions on the ground of unfairness, but its jurisdiction to do this is questionable, and it would be a doubtful policy on its part to invite a discussion of its power to transcend the law as laid down by the courts. The manufacturers of many proprietary articles have, naturally, for some time been much disturbed about the legality of their selling methods, and they are to be congratulated upon a decision which removes all doubt and permits them to sell according to principles justified by sound economics."

FORMULA DISCLOSURE CASE DECIDED IN FAVOR OF E. FONGERA & CO

By a decision of the Court of Appeals of the State of New York, all judges concurring in the result, the judgment of the Appellate Division

of the Supreme Court in permanently enjoining the enforcement of the so-called "formula disclosure" ordinance, has been sustained.

The Goldwater ordinance (New York) was enacted in December 1914, and required either the disclosure of the ingredients on a package, or the filing of the names of the ingredients with the (New York) Department of Health. The ordinance was to have become effective January 1, 1916, but bills for an injunction were filed in the Supreme Court. It was then agreed to submit the points claimed by the Board of Health and by E. Fongera & Co. to the Appellate Division of the Supreme Court, which held that the ordinance was in violation of the State constitution in that it did not constitute a reasonable exercise of the police powers. The city appealed to the Court of Appeals, with the result now reported.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

BOOK NOTICES AND REVIEWS.

The United States Public Health Service has just issued the following publication:

HYGIENIC LABORATORY BULLETIN NO. 112.

I. *Phenols as Preservatives of Antipneumococci Serum*.—A Pharmacological Study. By Carl Voegtlin. Reports results of experiments made to determine the suitability of trikresol and phenol as preservatives in antipneumococci serum.

II. *The Nature of Contaminations of Biologic Products*. By Ida A. Bengston. A study of the various contaminating organisms found in different classes of biologic products.

III. *The Effect of Ether on Tetanus Spores and on Certain Other Microorganisms*. By H. B. Corbitt. Report of observations made showing that ether cannot be relied upon to kill tetanus spores in vaccine virus.

This publication costs the Government considerable money and copies will be sent only to those making specific request for the same, and will not be distributed automatically as heretofore to all names appearing on the Bureau mailing list.

Proceedings Seventh Annual Meeting of American Drug Manufacturers' Association.—The Proceedings of the Seventh Annual Meeting of the American Drug Manufacturers' Association, held January 29 and 30, 1918, has just

been issued. It is a book of about 350 pages and contains as frontispiece a picture of the late Henry J. Woodward, of Allaire Woodward & Co., Peoria, Ill. There are also inserts of the speakers and invited guests of the smoker and the banquet given at the Waldorf-Astoria. The address by Prof. Henry Kraemer, "Kultur vs. Culture," was delivered at the smoker. It was illustrated by stereopticon slides and received much favorable comment, and thereafter printed in several pharmaceutical publications. The speakers at the banquet were Hon. Abram I. Elkus, U. S. Ambassador to Turkey; Hon. Theodore E. Burton, ex-Senator, and Rt. Rev. Charles S. Burch, Bishop Suffragan of the Diocese of New York. These instructive addresses add value to the book as a library volume. Another interesting address was delivered by Dr. Fred B. Kilmer on the subject "After the War—What?"

The address of President Chas. J. Lynn comprised a review of drug activities and legislation, discussing various subjects at considerable length. The reports of other officers and committees are likewise of value, but the greatest interest to the greater number of this Association is that of the Committee on Standards, which with discussion on the topics occupies about one hundred pages. This report should have a wider distribution.

OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1918-1919.

President—Charles H. LaWall, 39 South 10th St., Philadelphia, Pa.

Honorary President—Oliver F. Fuller, 540 W. Randolph St., Chicago, Ill.

First Vice-President—F. W. Nitardy, 66 Orange St., Brooklyn, N. Y.

Second Vice-President—Theodore J. Bradley, 70 St. Botolph St., Boston, Mass.

Third Vice-President—Francis Hemm, 2108 Locust St., St. Louis, Mo.

General Secretary—William B. Day, 701 So. Wood St., Chicago, Ill.

Treasurer—Henry M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Reporter on the Progress of Pharmacy—H. V. Army, 115 West 68th St., New York, N. Y.

Editor of the Journal—E. G. Eberle, 253 Bourse Bldg., Philadelphia, Pa.

Local Secretary—Hugo H. Schaefer, 115 West 68th St., New York, N. Y.

Chairman of the Council—Lewis C. Hopp, 1104 Euclid Ave., Cleveland, Ohio.

Secretary of the Council—J. W. England, 415 North Thirty-third St., Philadelphia, Pa.

EDWARD ROBINSON SQUIBB

BROOKLYN, N. Y.

Born July 4, 1819—Died October 25, 1900.

"His recognized ability and well-known integrity raised the standard and set in motion forces tending toward better pharmacy, the influence of which is felt unto this day."—John F. Patton, Presidential Address, Proceedings A. Ph. A. 1901, p. 7.

Very truly yours,
E. S. Quibb

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

DECEMBER, 1918

NO. 12

EDWARD ROBINSON SQUIBB.

A number of reasons, that will become apparent, prompt the presentation of this sketch.

Dr. E. R. Squibb was born at Wilmington, Del., July 4, 1819, hence the New York meeting of the American Pharmaceutical Association will be held during the centennial year of his birth.

In 1857 Doctor Squibb aided in the establishment of a medical supply laboratory in Louisville, Ky., and the chief medical purveyor of the Army induced him to establish the laboratory in Brooklyn. His work in the interest of the Army and Navy, pharmacy and medicine, is a matter of record. The report of the Committee on Drug Market, A. Ph. A., of 1863, of which he was chairman, is comprehensive, and some of the items, under discussion, were subjects of recent considerations.

We quote from a paper by Prof. Curt P. Wimmer on "Edward R. Squibb's Lecture Course in Pharmacy," before the Historical Section, A. Ph. A., at Chicago:

"In his (Doctor Squibb's) introductory lecture (1869), he wrote on the black-board: 'A pharmacist is not a druggist,' and by way of explanation said: 'A druggist is a merchant in drugs, a dealer in substances which, though originally used in medicines, came to be used in many other arts. The pharmacist, synonymous with pharmacist and apothecary, but not with druggist or chemist, is an educated, qualified practitioner of the art of pharmacy. He is a dealer in substances used to prevent and relieve distress; who has the knowledge and skill to secure a proper quality in his merchandise; to prepare this for its ultimate uses; and to secure it against accidental and criminal misapplication. The druggist is a merchant like the grocer, the dry goods dealer, etc. The pharmacist may be all this, but must be very much more.'"

The following data are taken from a sketch prepared some years ago:

"Edward R. Squibb served an apprenticeship with pharmacists of Philadelphia from 1837 to 1842, as a preparation for the study of medicine. He graduated from Jefferson Medical College in 1845, served as assistant demonstrator of anatomy and practised medicine until 1847, when he entered the Navy as assistant surgeon and saw active service for four years. In 1852 he was transferred to the Naval Hospital in Brooklyn, then under the direction of Dr. Franklin Bache.

While serving in the Navy he observed the poor quality of many of the medical supplies furnished on contract. Through their efforts, Congress was led to consider 'quality first and price second.' In 1857 he resigned his commission to aid in establishing a medical supply laboratory in Louisville, Ky. His success attracted the attention of the chief medical purveyor of the Army, who induced him to establish a laboratory in Brooklyn, N. Y. In December 1858, when scarcely well under way, the laboratories were destroyed by fire, and while attempting to save his books his face and hands were terribly burned. In 1869, after having declined flattering offers to teach in the colleges of medicine, he accepted the chair of pharmacy at the New York College of Pharmacy, but did so on two conditions—he was to receive no pay and he was not to be called Professor. He held this position until 1872. He joined the American Pharmaceutical Association in 1855 and was made a life member in 1900. He was its vice-president in 1858-59. In 1873 he received the honorary degree of Doctor of Pharmacy. He was a member of the Pharmacopoeial Revision Committee of 1860; a member of the Convention for the Revision of 1870, but refused to serve on the committee; elected a member of the Convention for the Revision of 1880, but resigned. The convention of 1900 thanked him for his painstaking work in the realm of pharmacy for fifty years, and for the unselfish manner in which he had always placed the result of his labors at the disposal of the several committees of revision."

As a member of the American Pharmaceutical Association, Doctor Squibb took an active part in its deliberations, as evidenced by the pages of the Proceedings. His studies and work in improving the process of percolation are printed in the Proceedings of 1865, 1866, 1867 and 1872. A paper by him "Notes and Suggestions upon Some of the Processes of the United States Pharmacopoeia, Especially Directed to the Committee of Revision," contains in outline his process for the manufacture of ether, spirit of nitrous ether, etc., and pleads for the introduction into the Pharmacopoeia of "that which relates to simple, reliable tests of purity of its materials and products."

Doctor Squibb was an indefatigable worker, a careful observer, possessed of high intellectual attainments, and actuated by positive convictions. He was a pioneer manufacturer of pharmaceuticals and chemicals, having entered the fields of American pharmacy soon after the organization of the American Pharmaceutical Association.

E. G. E.

OFFICERS-ELECT OF AMERICAN PHARMACEUTICAL ASSOCIATION, 1919-1920.

The result of the vote by mail, for officers of the American Pharmaceutical Association, has been announced as follows:

President—L. E. Sayre, Lawrence, Kas.

First Vice-President—Theodore J. Bradley, Boston, Mass.

Second Vice-President—Harry Whitehouse, Johnson City, Tenn.

Third Vice-President—E. Fullerton Cook, Philadelphia, Pa.

Members of the Council—J. H. Beal, Urbana, Ill.; Charles H. LaWall, Philadelphia, Pa.; S. L. Hilton, Washington, D. C.

THE HOLIDAYS.

A FLOOD of emotions consonant with a cheerful, happy time of charity and good fellowship is borne upon us by this joyful season.

While our thoughts are, naturally, with those who are near and dear to us, we cannot be forgetful of those who gave themselves as a sacrifice for the cause of our country, and of those who are sorrowful because of their loss and affliction. The present time is, therefore, most opportune for participating in the undertaking of the American Pharmaceutical Association in behalf of our soldier and sailor pharmacists, outlined on page 1005 of the November issue of the JOURNAL and further explained in the pages of this number. We join in many worthy purposes during this season, but this resolution presents a special, unusual opportunity to evidence our fellowship and convey assurance to the Government and to the public that we are optimistic relative to the mission of pharmacy, and convinced of its importance to humanity. Pharmacy will be judged, more than ever before, by the estimate we put upon ourselves.

We extend our greetings—"A Merry Christmas for All," and arrange the words of our Christmas Wish in this way: That our impulses will be actuated by a desire to be of service to others, and to ourselves; that our strength may be equal to the greater duties that have come upon us—as citizens, as pharmacists and as members of this Association. May all of us be able to bring joy to others and thereby share the rich heritage of the giver!

The most eventful year of history is coming to a close, bringing us to a new year fraught with equally important, though very different problems. We share in the responsibilities as citizens, but the discoveries in medicine during the war bring the need of research work to pharmacists. The present high standards demanded by the medical profession point to the necessity of having a larger number of trained pharmacists who can and will collaborate in related pharmaceutical research. Pharmacy is part of the mosaic, medicine, and permanent results of the discoveries are dependent upon the intelligent coöperation of the several branches. We have before us a wide field for our activities and the possible benefits therefrom for humanity, and the advancement of pharmacy should spur us on to our very best efforts. It is only by good team work, genuine co-operation, sympathy and a measure of unselfish devotion that real success can be achieved in the field of medicine.

We should be masters of our profession and see that pharmacy does not lag, especially during this period when great progress must and will be made in all

the industries and professions. There is no incompatibility between a strict observance of professional ethics and good business management. In the drug business, with which pharmacy is associated, the latter is essential; in fact, the success of a business or profession, in this respect, in a degree, is a measure of its importance. While it is highly desirable that pharmacy be given more recognition in the drug store, and the separation of pharmacy from the multiplicity of stock that characterizes many of the modern drug stores a consummation to be hoped for, there is no reason why a properly conducted pharmacy should not be possible within a drug store. The truth is, the greater number of our foremost pharmacists, due to present environments, are also merchants, who are observant of business and professional ethics. Ethics is the doctrine of man's duty in respect to himself and the rights of others. The course of progress in pharmacy should be directed for the benefit of the greatest number. The business of the drug store should be conducted according to modern ideas and methods.

Our wish for a Happy New Year conveys the hopes for a liberal share of prosperity and the joy of good health. We bespeak your intensified interest for pharmacy and the Association. If the revenue of the JOURNAL is augmented the possibilities for other work of the Association are increased. The encouragement of new patrons for the advertising pages is one of the means to that end. These have been trying times for publications and the difficulties are not immediately overcome by the prospects of peace. A word from the members to possible advertisers is worth more than a letter of solicitation from the office, therefore your coöperation is asked for.

Work in the Association gives pharmacists the opportunity of expressing their thoughts concerning pharmacy and the drug business—of exerting their influence; a broader viewpoint is developed and a higher appreciation of their co-workers is inspired.

The substance of our message finds expression in the following: That pharmacy may progress during 1919 through a greater enthusiasm and better coöperation among the members of the Association; a willingness to make some personal sacrifices so that pharmacy and the Association may become more effective as an agency for good to the votaries, and of greater service to humanity. That there may come the realization that however much pharmacists may have done for pharmacy and the Association, they, themselves, have profited more, by giving. That pharmacists and druggists may develop a larger measure of professional and business efficiency, upon which the world is now putting so large a premium. That the year 1919 will be the biggest year in the world's history for pharmacy and the drug business, because the achievements, successes and progress of the past are added to its opportunities.

A PROPOSED RESEARCH INSTITUTE.

ON the evening of November eighth, the New York Section of the American Chemical Society held a highly interesting and important meeting at which the subject under discussion was the founding of a research institution with a capitalization of from one to five million, for the purpose of coöperative study of the chemistry and pharmacology of synthetic organic chemicals, designed for medical use.

The meeting was arranged by the chairman of the Section, Dr. Charles H. Herty, who, in one of the editorials in the September number of the *Journal of Industrial and Engineering Chemistry*, had submitted the proposition in general terms to the ten thousand members of the American Chemical Society. Other addresses were made by representatives of the Bureau of Chemistry, of the Rockefeller Institute, of the Mellon Institute, of the drug manufacturers and of the tar products manufacturers. Curiously enough, the one group which has been attempting work along this line, the Council on Pharmacy and Chemistry of the American Medical Association, was not represented unless Doctor Alsberg is considered in a dual rôle of head of the Bureau of Chemistry and member of the Council on Pharmacy and Chemistry.

It is a matter of interest to note that at least two of the speakers are members of the American Pharmaceutical Association and it is hoped that this presages that when the institute comes into being, American Pharmacy will be adequately represented.

The movement is one of vital importance to every member of the A. Ph. A. and furnishes the best argument for the federation idea which is now dominant in American Pharmacy. It also proves the need of aggressive work on the part of the Research Committee of our Association.

Critics of the A. Ph. A. say that while we talk, others act. There is a very present danger if we do not bestir ourselves and act right now the sneer will become a fact. For twenty years we have talked of an institution somewhat resembling the one that Doctor Herty has in mind: notably in 1901, when the Procter memorial was under discussion and in 1912, when an A. Ph. A. Home was discussed on the pages of this JOURNAL. The Procter Memorial resolved itself into a statue without a site or a pedestal; the A. Ph. A. Home is in a somnolent condition; and now, while we are talking about federation, an organization but remotely interested in medicine and pharmacy takes up a proposition that all branches of American Pharmacy could and should have brought about years ago.

The foregoing paragraph is not intended as pessimism. It bluntly states unpleasant facts in an endeavor to stir American Pharmacy into action. The American Pharmaceutical Association, during its sixty-six years of existence, has ever held aloft the beacon light and urged American Pharmacy to "follow the

gleam," and it is not always the Association's fault that what it has proposed has not been carried out.

Such is strikingly the case in the present situation. If the proposed research institute does come into being without proper pharmaceutical representation, the blame will rest on the entire personnel of American Pharmacy and not merely on the pathfinder—the American Pharmaceutical Association. H. V. A.

DISCONTINUANCE OF THE STUDENTS' ARMY TRAINING CORPS.

IN the November issue of the JOURNAL considerable space was devoted to the Students' Army Training Corps and an approved Pharmacy War Course. A number of schools made preparations for giving these military students a training and education in pharmacy, and quite a number of enlisted men were enrolled. Now, before the first term of instruction has been completed, comes the order for immediate demobilization. We have no direct information, at this writing, that the order applies, immediately, to pharmacy schools, but presume this is the case; whether this is the effect of the order or not, the comment will apply in a general way.

The S. A. T. C. proposition was a new one; the thought uppermost in the minds of the people was preparation for war, so it would have been surprising if the devised plan for educating young men while training them for military service had proven entirely satisfactory to all concerned. The military training was of prime importance in the scheme, hence, the various institutions, engaging in the work, were lost in the process of military standardization.

It would seem that, financially, the Government is responsible to the schools or colleges for the terms of its contract with them or, if not, obligated to an adjustment of the expenses incurred by these institutions in preparing to meet the requirements of the Government. Most educational institutions, including those of pharmacy, were seriously handicapped by the war and, while the S. A. T. C. was looked upon as an opportunity for carrying on the work of the schools, their acceptance of the plan was, in a measure, prompted by a desire to coöperate with the Government. Taking these facts into consideration, the opportunity for experimentation might have been improved by studying the adaptability of the courses for universal military training. If the latter is adopted then education of the youth must also be provided. True, our military schools have solved the problem, but pharmacy should also be taught, and here was an opportunity which might have been tested out. The same thought applies to other branches. It would have been necessary to rearrange the courses by reintroducing the flexibility and individuality of the institutions wherein these courses had been installed, but this would have enabled them to continue their work, even though the number of students had been materially reduced.

While most of the medical schools entered into the S. A. T. C. plan, because it was a war measure, they were ready to discontinue the program when hostilities ceased. It is probable that pharmacy and technical schools would have preferred to continue the course under a rearrangement of the teaching schedule. And, if a system of universal training, applying to the young men under twenty years, is to be established, this might have afforded an opportunity for studying applicable educational methods.

Evidently, retrenchment is the chief reason for the order, though there has been an expressed disappointment at the working plan; experience would certainly have developed improved and more satisfactory methods. If the order is put into effect schools will sustain a financial loss which the Government should adjust.

E. G. E.

OFFICIAL STANDARD FOR CAFFEINE SODIO-BENZOATE.

BY A. B. LYONS.

According to the U. S. P. IX caffeine sodio-benzoate when dried to constant weight at 80° C. contains not less than 46 percent nor more than 50 percent of anhydrous caffeine, the remainder being sodium benzoate ($\text{NaC}_7\text{H}_5\text{O}_2$). It is not easy to account for so wide a margin of variation as this in a product which calls for so little skill in its manufacture. It is understood that originally it was prepared by combining caffeine and sodium benzoate in equal proportions. Official caffeine is a crystallized product, not liable to contain impurities, but variable in the amount of water of crystallization it carries. The crystals contain nearly 8.5 percent of H_2O to begin with, but by exposure to dry air they lose a considerable proportion of this, so that under ordinary conditions they retain less than half the original quantity. By exposure to a moist atmosphere they recover the water they have lost unless they have been rendered quite anhydrous, in which condition they apparently refuse to take up more than about 3 percent of moisture, practically one-third of one molecule of H_2O .

Grant that caffeine may contain as much as 9 percent of H_2O , and that it may possibly be quite anhydrous, a mixture of this with an equal weight of pure dry sodium benzoate would contain after drying completely at 80° C. at least 47.69 percent, at most 50 percent, of anhydrous caffeine. An allowance of 0.5 percent for inaccuracies in weighing would make these figures, respectively, 47.45 and 50.25 percent.

The assumption that the remainder of the product is pure $\text{NaO}_7\text{H}_5\text{O}_2$ is not consistent with the "rubric" for official sodium benzoate, which is allowed to contain 1 percent of impurity as shown by alkalinity of the ash. Whether or not this impurity is non-volatile the test does not show, so that it is not possible to say exactly how the figures arrived at above will be affected, but it would appear that a range of 47 to 50 percent ought to cover the practical possibilities, making no assumption of expert knowledge on the part of the manufacturer.

But it is the manufacturer who is most competent to decide the question what standard is most just to all parties concerned. Money values of course come

into consideration where costly drugs are concerned, but only subject to the standards and requirements of the pharmacopoeia, where such exist. In the present instance, we have the clear statement that official caffeine has a molecular formula including nearly 8.5 percent of water of crystallization. It is this product and no other which he will use in making the double salt, just as it is sodium benzoate containing not less than 99 percent of $\text{NaC}_7\text{H}_5\text{O}_2$ that he will use as the second constituent of an ideal product.

In practice he will find probably that the caffeine has lost a portion of its water of crystallization, and it may be that the sodium benzoate contains some hygroscopic moisture, and so the quantities of each which he will take to make caffeine sodio-benzoate will be adjusted to the ideal standard and his product will assay for the U. S. P. method somewhere near 47.7 percent of anhydrous caffeine. Merck's product is stated to contain 47.9 percent. There is no reason why any great range of variation should be permitted, since the manufacturer can be trusted to make a correct adjustment in the quantities of caffeine and of sodium benzoate which he uses. In the case of official chemical salts and similar products it appears that variations of more than one-fourth of one percent are not considered excusable. It is certainly not more difficult to adjust the caffeine content of the double salt to a correspondingly narrow range, perhaps between 47.3 and 48.0 percent, and the range having been fixed, there should be no difficulty in keeping within such limits.

It will be noticed that this range is much narrower than that arrived at in the initial discussion above. The reason for the discrepancy is that in that discussion the possibility was admitted of presence in the sodium benzoate of a considerable quantity of hygroscopic moisture, whereas the manufacturer maintains the ideal of a salt which *without drying* is at least 99 percent pure. We can see no reason why his assumptions should not be adopted as a basis for the official requirements for this product.

THE EFFECT OF ALCOHOL ON PITUITARY EXTRACT.

BY HERBERT C. HAMILTON.

It not infrequently happens that when a salesman, detail man or other member of a firm of manufacturers of pharmaceutical products is confronted with the statement that a certain preparation fails to act in its accustomed manner, he points out a number of possible factors in attempting to find the cause in the particular case.

Pittenger presented a paper before the Scientific Section of the A. Ph. A. 1918 meeting (published in the October issue of the Journal) in which he notes one such instance where the well-known fact that alcohol precipitates the active constituent of pituitary extracts had been advanced as the possible explanation of a failure of this preparation to act on the uterus muscle.

The writer whose discussion of this paper on the floor is not given in the published proceedings corroborated the facts there presented and noted that the question had come up on more than one occasion and that laboratory experiments had in every case shown that alcohol in the quantity present could not affect the activity of this preparation unfavorably.

The subject seems important enough to be carried somewhat further in order to explain fully the conditions under which alcohol can affect the pituitary extract unfavorably.

The writer has observed that a commercial sample of pituitrin shows an opalescence from the action of strong alcohol but that a mixture of equal parts pituitrin and 95% alcohol shows no permanent opalescence and no precipitate. Diluted and injected into the circulation of an anesthetized dog in the usual method of testing there is no perceptible lowering of its activity. This is very much in excess of the possible alcohol content from washing the syringe or the site of injection.

A further experiment has been carried out on a highly active dry pituitary product. This material was ground in a mortar and rubbed thoroughly with 95% alcohol adding successive portions and filtering the alcohol to obtain a clear solution.

Three series of tests were made on the resulting products, namely, tests of the dry material after being washed with alcohol, tests of the residue remaining on recovery of the alcohol, first, an aqueous solution of this residue and second a hydro-alcoholic solution of the residue.

The results of these tests showed that 95% alcohol is not a solvent for the active principle nor has it any deleterious action; the active agent was no less active and the residue from evaporation of the alcohol had neither pressor nor oxytocic activity.

The only reaction between alcohol and pituitary extracts is when the former is present in great excess, in which case it acts as a precipitant.

RESEARCH LABORATORY OF PARKE DAVIS & CO.,

THE DETERIORATION OF TINCTURE OF DIGITALIS.*

BY PAUL S. PITTENGER.

In a recent publication entitled "The Deterioration of 'U. S. P.' and 'Fat-Free' Tinctures of Digitalis," Pittenger and Mulford, Jr.,¹ gave the results of a series of experiments which were carried out with two objects in view:

First, to show that Tinctures of Digitalis deteriorate quite rapidly and

Second, to advance experimental data to disprove the statements made at several medical society meetings, that fat-free preparations deteriorate more rapidly than the regular U. S. P. tincture.

The results of physiologic assays made on each of 15 samples five and eight months, respectively, after the first test, were given to substantiate the author's claims that "Most tinctures of digitalis *do deteriorate*" and that "Fat-free tinctures of digitalis *do not deteriorate at a greater rate than the U. S. P. tincture.*"

Since publication of the above paper, Hamilton in a recent publication² takes exception to the results given because the fifteen samples tested showed an average

* Read before Scientific Section, A. Ph. A., Chicago meeting, 1918.

¹ Pittenger and Mulford, Jr., JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION, March 1918, p. 236.

² Hamilton, "The Deterioration of Digitalis Extracts," JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION, May 1918, p. 433.

deterioration of 34.8 percent in 8 months which he states "would lead one to infer that the tincture is practically worthless." Exception was also taken to the fact that the regular tinctures made with 50 percent alcohol showed an average deterioration of 47.8 percent and that the Fat-free Tinctures made with 80 percent alcohol showed an average deterioration of 40.7 percent, while the Fat-free Tinctures made with 50 percent alcohol showed an average deterioration of only 22.8 percent. "From this" the author states "one might conclude that a tincture is of little value unless made by extracting fat-free leaves with 50 percent alcohol, since Fat-free Tincture with 80 percent alcohol is apparently no more stable than that with less alcohol."

It was not the intention of the authors to use the results given to show the average rate of deterioration of Tinctures of Digitalis or to claim, or infer that a tincture made with 80 percent alcohol was less stable than one made with 50 percent alcohol. In fact, several years ago when the menstruum for the U. S. P. Tincture was 50 percent the author carried out many tests on the comparative rate of deterioration of Tinctures of Digitalis made with menstrua of 50, 60, 70 and 80 percent of alcohol, respectively, and found that as a general rule the higher the percentage of alcohol employed the slower the rate of deterioration. On the basis of these experiments we raised the alcoholic content of our digitalis specialties to 80 percent several years before the U. S. P. increased the percentage of alcohol in the official tincture.

Unfortunately, in the set of experiments quoted, for some unknown reason the opposite condition of affairs prevailed.

I therefore thoroughly agree with Hamilton in that "It seems improbable that tinctures with low alcoholic content would be uniformly found more stable than when extracted with 80 percent alcohol, whether the drug was fat-free or not," also "that no data either good or bad should be accepted as representing the average condition of digitalis after any particular period of aging."

This latter point is clearly illustrated in the paper by Hamilton, referred to above, in which the results of a series of experiments by Houghton and Hamilton¹ on Tinctures of Digitalis made with 50 percent alcohol are given with the following conclusion: "*That a maximum average loss of 10 percent a year can be expected in tinctures or fluidextracts of digitalis.*" On the same page are given the results of experiments carried out by Rowe on 6 Tinctures of Digitalis made with 70 percent alcohol in which he found an average loss on 6 samples of 21 percent in 6½ months.

Owing to the deterioration which occurs in digitalis preparations, we established, 4 or 5 years ago, a routine by which all tinctures of digitalis which are not sold within 3 months from date of manufacture are sent to the laboratory to be retested in order to determine whether or not the preparation has deteriorated. If it is still of standard activity it is given a new date of test. If deterioration is shown, however, it is taken from stock, fortified and restandardized.

The results of these tests are very interesting and show that the rate of deterioration of tincture of digitalis varies greatly with different lots. While the great majority of samples deteriorate, and some deteriorate very rapidly, there are quite a few samples which apparently do not deteriorate at all.

¹ Houghton and Hamilton, *Am. Jour. of Pharmacy*, Oct. 1909.

I have also noticed that in many cases preparations deteriorate rather rapidly during the first three months and then remain practically permanent thereafter.

The accompanying table shows some of the data on the deterioration of Tincture of Digitalis that we have obtained by the above method of routine testing.

DATA SHOWING DETERIORATION OF TINCTURE OF DIGITALIS.

| 1st Test. | Date. | 2nd Test. | Date. | 3rd Test. | Date. | 4th Test. | Date. | No. of months between first and last test | Deterioration. | Aver. Deter. per Mo. Dur- ing 1st 3 or 4 Months. | Av. Deter. per Month After 1st 3 or 4 Months. |

The tabulated results show the average deterioration in 9 to 13 months of 43 samples to be 18.8 percent. The average deterioration of 38 samples during the first three or four months being 4 percent per month, while the average deterioration of 32 samples after the first three or four months was 2.4 percent per month.

TABLETS FOR THE DISINFECTION OF DRINKING WATER.*

BY BERNARD FANTUS.¹

For the disinfection of small quantities of drinking water, such as those that might be gathered and carried by rapidly moving troops, tablets constitute by far the most satisfactory form for use. Hence the study of these becomes of special importance in war time. To be ideal, such tablets should be small, prompt and reliable in action, perfectly harmless, and leave the water free from offensive odor or taste, and finally be relatively inexpensive. This study was undertaken to determine the nearest approach to the ideal.

Chlorine, by far the most potent disinfectant, is at the same time the most harmless, as in exercising its disinfecting action, it is changed to chloride ions. While liquefied chlorine is the most satisfactory form in which to use this agent for water disinfection on the large scale—the city of Chicago for instance, adding to its drinking water from three to five pounds of liquefied chlorine per million gallons of water—it is, of course, out of the question for the purpose under consideration.

Lime, in the form of chlorinated lime, is probably the most convenient and cheapest vehicle for chlorine; and this is, no doubt, the reason why the health department of the city of Chicago took up, in 1916, the question of preparation of chlorinated lime tablets. I am indebted to Dr. D. O. Tonney, the Director of the Municipal Laboratories, for permission to publish the data obtained by Mr. Jay Kaplan in this inquiry.

TABLET TRITURATES OF CHLORINATED LIME.

"The tablets were prepared as follows: Chlorinated lime containing not less than thirty percent of available chlorine is moistened slightly in a mortar to make a thick paste. It is important to add the smallest amount of water which will give a suitable consistency to the mixture. Very often the market product is sufficiently moist without further treatment. A tablet triturate mold of vulcanite, having fifty perforations, 5 mm. in diameter and 3.5 mm. in depth is used. The perforated half of the mold is placed on a glass plate and the paste is pressed into the impressions with a spatula. The mold is then placed for from five to ten minutes in an oven at 40° to 50° C. The tablets are now carefully forced out by fitting the two parts of the mold together and applying slow pressure. The tablet triturates thus prepared are shaken into bottles and tightly stoppered. The tablets ordinarily weigh from 120 mg. to 140 mg., and contain from 30 to 40 mg., of available chlorine. For distribution they are put up in homeopathic vials, ten tablets to the vial. The vials are tightly stoppered and kept, if possible, in a dark, cool place. Under average conditions, the disinfectant retains its potency for

* Read before Scientific Section A Ph. A., Chicago meeting, 1918. From the John McCormick Institute for Infectious Diseases. Aided by a grant from the Fenger Memorial Fund.

¹ Associate Professor of Therapeutics, Rush Medical College of Chicago.

about four weeks. The tablets are given out each summer by the Department of Health for the benefit of vacationists and motor tourists.

Directions for use: Dissolve one tablet by crushing between the fingers in one quart of water in an ordinary mason jar, which should be sealed with an air-tight cap. The jar is then shaken and stored in a cool, dark place. This is the stock solution and under average conditions will last about one week, after which it should be renewed.

"To prepare water for drinking, take one teaspoonful of the stock solution to one 8-ounce glass of drinking water, allow it to stand for about five minutes, when it is ready for drinking and will be safe. If it is suspected that the water is heavily polluted, two teaspoonfuls of the stock solution should be used to each 8-ounce glass of water. If it is desired to make up a daily supply, ready for use, it can be done by adding four teaspoonfuls of the stock solution to each quart of water.

The following experimental notes were made by Mr. Jay Kaplan on the keeping qualities of these tablets:

On September 16, 1916, about two hundred chlorinated lime tablet triturates were made from a fresh can of chlorinated of lime and distilled water, to give the proper consistency, etc.

Filled about nineteen tubes containing ten tablets each and sealed by fusing the glass.

On September 18, 1916—analyzed one tube (sealed two days) by U. S. P. assay method: 4 tablets, weight 0.5706 Gm., required: 30.3 cc. N/10 $\text{Na}_2\text{S}_2\text{O}_3$ = 18.68% available chlorine.

Four months later, on January 15, 1917, another tube assayed 11.12% average, which represents a deterioration of about 40% Cl gas under pressure in tube. (Note: When opened tablets appeared to be moist and had lost their shape.)

Seven and one-half months later, on May 1, 1917, the contents of two tubes were assayed. Upon opening each tube under water, a loud report was heard and a distinct splash seen. No water was sucked into the tube. The gas was evidently under pressure. The tablets were moist and sticky, and did not retain their shape when removed from the tube.

Assay = 3.27% available chlorine in one tube

3.32% available chlorine in another tube

Average = 3.30% available chlorine, a deterioration of 82.5%.

We may therefore conclude that chlorinated lime tablets prepared by the tablet triturate process do not possess satisfactory keeping qualities.

COMPRESSED TABLETS OF CHLORINATED LIME.

On the assumption that the moisture employed in the preparation of the tablet triturates was responsible for the rapid deterioration of the tablets, just described, Mr. Eicher, of the School of Pharmacy of the University of Illinois, kindly prepared for me some tablets by means of compression, using the following formula:

Chlorinated lime, 30%, or proportionately

larger amounts of weaker lime 0.59 Gm.

Sodium Chloride (granular). 10.00 Gm.

Divide into 100 tablets weighing about 105 mg. each, avoiding use of lubricant.

One of these tablets will disinfect one l. of moderately infected water within one hour in cool, or much sooner in hot weather.

These tablets, prepared on May 3, 1918, without special care as to drying, and kept in the dark, in a well stoppered bottle, were assayed from time to time.

May 6, 1918 5 tablets weighing 0.538 Gm. yielded 9.2 mg. available Cl.

June 15, 1918 5 tablets weighing 0.544 Gm. yielded 8.1 mg. available Cl.

July 8, 1918 5 tablets weighing 0.529 Gm. yielded 7.1 mg. available Cl.

Aug. 9, 1918 5 tablets weighing 0.536 Gm. yielded 6.5 mg. available Cl.

This is equivalent to a deterioration of about 10 percent per month; though the rate of deterioration is becoming less. Had the tablets been prepared from dried material, the deterioration would, no doubt, have been slower. Nevertheless, it must be admitted that chlorinated lime tablets are decidedly unstable. However, by the time the deterioration has reached 50 percent, which might be in the course of half a year, these tablets would still be as good as ever for disinfecting half the specified quantity of water.

COMPRESSED TABLETS OF HALAZONE.

Because of this instability of chlorinated lime tablets, H. D. Dakin and E. K. Dunham¹ advocated, for the purpose under discussion, *p*-sulphondichloramino-benzoic acid ($\text{Cl}_2\text{NO}_2\text{SC}_6\text{H}_4\text{COOH}$), and proposed the name "Halazone" for it. This substance is prepared from a cheap waste product in the manufacture of saccharin, which latter is ortho-sulphamino-benzoic acid. The para-isomer, which is not sweet, when chlorinated, constitutes halazone. This substance, very sparingly soluble in water, has its solubility increased by alkalies, such as sodium carbonate or borax. Dakin and Dunham found that 1 : 300,000 sterilizes water in about 30 minutes, leaving the water fairly palatable. They propose the following formula for tablets:

| | |
|-------------------------------|----------|
| Halazone..... | 4.0 Gm. |
| Sodium Carbonate (dried)..... | 4.0 Gm. |
| Sodium Chloride | 92.0 Gm. |

The material should be carefully dried and mixed, the alkali being added last, and made into 100 mg. tablets, without use of lubricant.

One such tablet is capable of disinfecting one l. of water in 30 to 60 minutes.

The authors referred to report² that they found such tablets kept in amber-colored bottles at ordinary temperatures almost unchanged for five months, and that they should be serviceable for considerably more than a year. Having fed this substance to rabbits in doses of 100 to 200 mg. per day without observable symptoms, they consider it perfectly innocuous in the small amounts required for sterilization of water.

I have verified the claims of Dakin and Dunham in practically every respect. Have fed halazone to kittens and to rabbits in doses of 100 mg. per day for over 4 months without observable deleterious effect, either during life or on necropsy. This dose would approximate 7 Gm. daily for a man, and only 4 mg. are required to disinfect one l. of water.

Halazone tablets (which as well as the halazone used in my other experiments were kindly furnished me by The Abbott Laboratories of Chicago) showed the following results on assay from time to time.

Bottle opened May 6, 1918.

May 6, 5 tablets, weighing 0.550, yield 10.6 mg. available Cl.

July 8, 5 tablets, weighing 0.561, yield 10.6 mg. available Cl.

Aug. 9, 5 tablets, weighing 0.573, yield 10.6 mg. available Cl.

Therefore, there has been practically no deterioration in four months.

¹ *Brit. Med. Jour.*, Jan. 29, 1916, also May 26, 1917, p. 682.

² *Ibid.*, Dec. 15, 1917, p. 790.

The only disadvantage that halazone presents is its comparatively slow action. Using equivalent strengths of chlorinated lime and of halazone, (calculated on the basis of "active chlorine"), I found that halazone required almost twice as long as chlorinated lime for disinfection. This is in accordance with what might have been anticipated, in view of the fact that chlorine is the active agent in both, and that it is more readily given off from chlorinated lime than from halazone. The greater instability gives chlorinated lime a greater rapidity of action. However, even with chlorinated lime in the concentrations recommended, it may take 30 minutes to obtain complete disinfection. Now 30 minutes may seem quite a long time to a thirsty man.

COMBINATION WITH CITRIC ACID.

Some studies were therefore undertaken to find out whether it is possible to accelerate the action; and I succeeded in finding such an agent in citric or other organic acid. Citric acid enables a concentration of chlorinated lime or halazone to act within one to five minutes when, without the acid thirty or more minutes would have been required. As little as $\frac{1}{20}$ percent of citric acid enables chlorinated lime, $\frac{1}{20,000}$ N, to disinfect in less than five minutes; an equivalent amount of halazone, to act within ten minutes.

Another advantage of the action of citric acid in chlorine disinfection is improvement of the taste of the water thus disinfected. Nearly all of us are only too familiar with the disagreeable taste of chlorinated water. The addition of citric acid, even in very small amounts, improves the taste in two ways: it tends to disengage the chlorine from the compounds it has entered in with the constituents of the water, and it substitutes a pleasant degree of sourness for the flatness and offensiveness of taste of the chlorinated water. In this connection, I might point out that citric acid greatly improves the taste of Chicago water, which is not only chlorinated but which, at times, somehow becomes contaminated with the flavor of rotten fish. When used for this purpose, a little of a citric acid solution, say 5 or 10 percent, may be mixed with the water; the amount used being entirely governed by the taste.

Inasmuch as citric acid acts by driving off chlorine, it is obviously difficult to incorporate it in a tablet, at least one made in the ordinary way. In an experimental lot of citric acid-chlorinated lime tablets, made with fairly well dried material, all chlorine had practically disappeared within twenty-four hours. When, therefore, citric acid is used to accelerate the disinfectant action of chlorinated lime, or of halazone and to improve the taste of the product, it might be necessary to make use of a two-tablet system, unless some other acid and special method of preparation, which absolutely excludes moisture, make it possible to incorporate the two in one tablet. Here is a field for further research.

CONCLUSIONS.

1. Halazone is the best material at present available for the preparation of water disinfecting tablets.
2. Compressed tablets of chlorinated lime are less stable; though not so unstable as to be useless.
3. The tablet triturate process is not suitable for the preparation of chlorinated lime tablets.

4. Citric acid, even in very small amounts, renders the action of these tablets much more rapid and the disinfected water much more palatable; but seems unsuitable for incorporation in one tablet with the chlorine disinfectant.

DISCUSSION.

CHAIRMAN EDWARD KREMERS stated that the two-tablet idea in disinfection reminded him of an object of historical interest in the Historical Drug Store of the Wisconsin Historical Society, namely, a large container of tablets containing manganese dioxide and sodium chloride. When chlorine was to be generated, sulphuric acid was added to some of these tablets. The label on the container bears the name of Dr. E. R. Squibb, who devised this method, and was employed for the War needs of that period (about 1860).

F. E. STEWART: What microorganism was used in testing out the disinfecting power of these tablets?

BERNARD FANTUS: Typhoid organisms. We carried out the experiments not only in distilled water infected with typhoid organism, but also in tap water. The details of this part of the work will be published in the *Journal for Infectious Diseases*.

EDWARD S. THATCHER: May I ask Doctor Fantus whether he confined his attention to typhoid bacilli?

BERNARD FANTUS: When tap water was used there were other bacteria present. Hence, when the tap water was sterilized, a number of other organisms had also been destroyed.

L. F. KEBLER: As the important thing is to make the drinking water safe, it is necessary to avoid the use of too much of the disinfectants. I presume the taste would be the final deciding factor, but I have been wondering what would be the effect of too much of the disinfectants. An experience with too much copper sulphate for a like purpose came under my observation. This is a matter of importance.

H. C. HAMILTON: In my experience, I have found that it was more difficult to disinfect tap water than distilled water. The presence of chemicals cuts down the effect of the disinfectant.

Referring to the remarks of the last speaker, copper sulphate is effective for treating water containing vegetable growths, but not so efficient for killing bacteria.

BERNARD FANTUS: In the sterilization of tap water I found much greater variations than in the disinfection of infected distilled water. Some days it was more difficult to sterilize tap water than distilled water, on other days the reverse was true. This was due to the variations in the Chicago water supply.

F. E. STEWART: It is highly essential to ascertain how many bacteria are present in water, and whether a bacterial count was made to determine the number of the bacteria present in the drinking water.

BERNARD FANTUS: In the water disinfected in my experiments there were 30,000 to 90,000 bacteria per mil.

THE EVOLUTION OF CHEMICAL SYMBOLS.

BY INGO W. D. HACKH.

Evolution is progress, progress is the transition from the incomplete to the complete, an increase in value, either spiritual or material. The evolution of scientific knowledge illustrates best "how human knowledge grows" and progresses. To a student of any science its historical development will be of great benefit in understanding the ideas and conceptions involved. The development of chemical symbols, for example, offers a miniature history of chemistry and is an interesting topic in more than one respect.

In the dark epoch of the middle ages as the alchemists attempted to gain wealth and eternal life by the search for the philosopher's stone, man's position to the material world was entirely different. At that time man was still laboring

under the conception that by some secret formula he could change the natural laws governing the material world. He thought to impress his belief what "should be" upon matter and thus worked out an elaborate system of a philosophy of nature, intermingled and permeated with mystic and superstitious ideas. In all alchemistic writing one comes constantly across this intermingling of spiritual ideas and material conceptions. The symbols used to designate certain substances were allegoric and symbolic of spiritual ideas, like love and hate, male and female, light and darkness, etc. The masculine and feminine principles were imparted to the substance itself. Matter became animated and possessed life. There are many evidences that the experiments were conducted as a kind of sacred rite, accompanied by prayers and chastisements. It has been shown, *e. g.*, that the common abbreviation for *recipe*, R, was originally the sign for Jupiter, the supreme deity of the Romans, for before mixing the ingredients, it was necessary to pray first for the successful conclusion of the manipulation. Even the very name, "crucible," for the common laboratory utensil, indicates the fact that before the alchemists applied heat to their mixtures in their earthen vessels, they made the sign of the cross—Latin *crux* (gen. *crucis*) and prayed for success. Very often explosions and breakage occurred, and of the casualties we have no record. No wonder that the alchemists were held in fear, for they conducted strange operations with flames and noises, prayers and death.

To the mind of the alchemist, matter was thus animated, and according to the properties of matter, these were either masculine or feminine. Upon these conceptions the strange and mystic theories were constructed and embodied in symbols. The symbols differ greatly for one and the same substance, and the tracing is therefore extremely difficult. An old volume of 1783, which is said to be based upon a work of 1549 and a manuscript of 1300, gives a great number of these symbols, some of which are represented in Fig. 1. One can see the great diversity, which makes the tracing of the origin of these symbols very difficult.

The search for the philosopher's stone, or alkahest, was at its height during the fifteenth century, and as pointed out above, attained the dignity of a religion. In fact, many reputable bishops and fathers of the Roman Church were professed alchemists. This intimate association of alchemy with religion, of mysticism and theosophy, of chemical operations and rules for the conduct of life, is clearly shown by the writings of Raymond Lully (1235–1315), Albertus Magnus (1193–1282), Arnoldus Villanovus (1240–1313), Basil Valentine and others. Naturally their quest remained unsuccessful.

A new direction of thought was initiated by the founder of Iatro-Chemistry, Phillipus Aureolus Theophrastus Paracelsus Bombastus *von* Hohenheim, who lived from 1493 to 1541 and whose eventful life is most interesting and adventurous one. One writer says of him "he lived like a pig, looked like a drover, found his greatest enjoyment in the company of the most dissolute and lowest rabble, and throughout his glorious life was generally drunk;" another writer, however, describes him as "a man of noble character and intentions, a Christian humanist and ambulatory theosophist, who hoped to inspire mankind with a love of conscientiousness and veracity, and to restore the suffering to health."¹

¹ Hendrick, "Everyman's Chemistry," 1917, p. 195.

FIG. 1.—Alchemistic Symbols of the 15th and 16th Centuries.

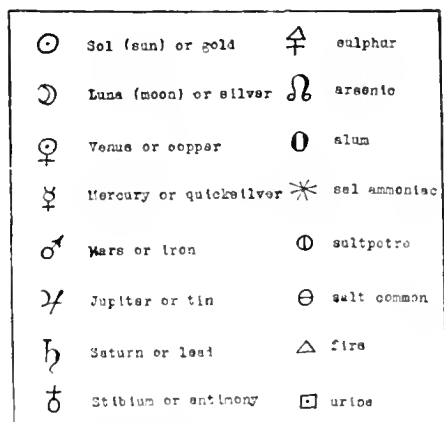

FIG. 2.—Alchemical Symbols of the 17th Century.

True it is that he violently attacked the physicians, adhering to the old traditional treatments, and the alchemists, who searched for the transmutation of metals. His doctrine was that the knowledge of alchemy should be applied to the healing of diseases. To this end he established his allegorical and pantheistic philosophy of harmonies, which centered around Soul-Mercury-Water-Nymphs, Spirit-Sulphur-Air Sylphs, and Body-Salt-Earth-Pigmies. As a physician he worked with various results, the fatalities were ignored and his successful treatments exploited by his followers. Slowly chemical knowledge was diverted to medicine and pharmacy.

In Fig. 2 the symbols of the Pharmacopoeia Batanea (1694), by William Salmon, a quack of the 17th Century, are reproduced. These symbols already show an emancipation from mystical allegories, for although the astronomical signs are preserved,

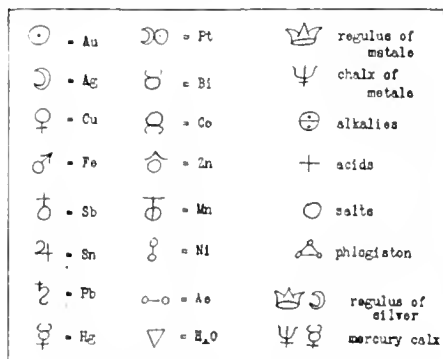

FIG. 3.—Symbols of Torbern Olof Bergmann (1735-1784).

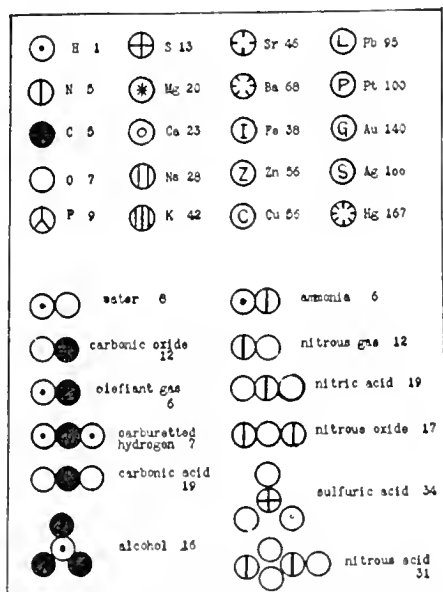

FIG. 4.—Symbols of Dalton (1766-1844) showing the old "relative weights" and terminology.

the symbols now denote the metals and substances and are used as abbreviations for them. e. g., antimony is mentioned as stibium, and not as "earth."

Further development is seen in the symbols of Bergmann, Fig. 3, who published in 1783 his "*Opuscula physica et chimica*." These symbols form a part of a very elaborate system by which chemical knowledge of that day was represented. They were in use at the time of the founding of modern chemistry, for Lavoisier and Berthellot used these and similar signs.

The chemical experience of mankind had now attained such a state when the atomic theory was in the air, for already Bergmann had observed the replacement of metals in solution, and Lavoisier tried to explain this by affinity. Richter and Fischer worked on acids and bases, on neutralization, and introduced the term stoichiometry, but it was for Dalton to lay the foundation of the atomic theory.

Dalton's symbols (see Fig. 4) appeared in 1808 in his "New System of Chemical Philosophy," and were the result of his studies on the composition of marsh-gas and ethylene and the oxides of nitrogen. Thus the cornerstone of modern chemistry was laid upon the fundament established by Lavoisier.

FIG. 5.—Graphic Notation of Kekule, Naquet, Frankland and others.

FIG. 6.—Some Simple Structure Symbols of Organic Compounds.

In 1814 Jöns Jakob Berzelius replaced the geometrical signs of Dalton by the initial letter or letters of the elements, and thus introduced the customary symbols of to-day. Chemistry advanced rapidly, and the work of Kekule, Liebig, Woehler, Dumas, Naquet and Frankland developed the graphic notation of Fig. 5 which developed into the structure formula. But before the chemical symbols became established as denoting a single atom and a definite atomic weight, they had to undergo during the period of establishing, the correct proportion of oxygen and hydrogen in water, the confusing use of the "barred notation," that is, in chemical formulas the old equivalents were designated by symbols, the new atomic weights by the symbols with a bar through them. This notation makes the reading of the literature of this time complicated and confusing.

A modern development of chemical symbols are the structure-symbols for organic compounds.¹ These structure-symbols are based upon the fact that the majority of organic compounds contain the elements hydrogen, oxygen, nitrogen and carbon. The respective valencies of these elements are one, two, three (or

¹ A Chemical shorthand, *Can. Chem. J.* 2, p. 135, 1918. Organic Symbols, *Science*, 48, p. 333, 1918.

five) and four, and differ therefore for each element. Upon this fact is based the system of structure symbols, and in Fig. 6 some of these symbols are given. It is evident that with this simple principle to each organic compound, a definite and different symbol can be given, for the atoms of the respective elements are thought to be points, and the points are determined by lines, thus where a line begins or ends an hydrogen atom is supposed to stand; where the line makes an angle or two lines come together, oxygen stands; where three lines meet or radiate, nitrogen exists, and at the point where two lines cross or four lines come together, an atom of carbon is thought to exist. While these symbols at first might seem to be complex, they make in reality the study of organic chemistry much simpler, for a little practice in deciphering and constructing these "valence-structures" will enable the student to form clearer images of the structure of a compound. They are the structure-skeletons; for any structure formula can then be taken, each atom has to be written down by its symbol, and the symbols connected by the bonds, and then all the symbols are erased and the bonds left standing will yield the "structure-symbol."

The elements H, O, N, and C, have been called bio-elements, for they constitute over 99 percent of all living matter, less than 1 percent is filled up by other elements. Similarly the elements which constitute the rocks and stones are mainly the oxides of Na, Mg, Al and Si, forming, as silicates, the larger part of the known earth crust, although of their structure we know little, for their composition is complex and defies the ordinary methods of structure-analysis. Nevertheless, the new researches on crystal structure, with the help of X-rays, will, perhaps in the future, throw more light upon the chemistry of the silicates, and if the structures should become better known and established, the same method of representation can be employed. Like in the structure symbols of organic compounds the valencies are made the basis in the system, so could also the valencies of Na -1 , Mg -2 , Al -3 and Si -4 be employed to form the basis of structure symbols for the rock-forming silicates, distinguishing them from the bio-elements, *e. g.*, by a circle.

The evolution of the chemical symbols is an interesting chapter of chemistry and illustrates the attempts of human mind to represent its conception of facts in a concise way, from the allegorical symbols of the alchemist, to the structure-symbols of to-day, which illustrate our present conception of organic structures.

PROBLEMS OF THE MANUFACTURER OF MEDICINAL CHEMICALS DIRECTLY RESULTING FROM WAR CONDITIONS.*

BY B. L. MURRAY.

It may safely be said that all manufacturing enterprises in the United States have encountered problems directly resulting from war conditions. It is not possible that one industry, or indeed one individual, has remained isolated and unaffected by the war now four years old. We may not perceive in our casual observance of an industry, in just what manner war conditions have had their

* Read before Scientific Section A. Ph. A., Chicago meeting, 1918.

effect, but it is unthinkable that any can remain undisturbed when all the great nations of the world, and many of the lesser, are engaged in the most stupendous war of all time.

The steel industry, for example, has its problems. You have read of them. The largest and most highly organized steel industry in the world is at this minute straining every nerve to produce enough to meet war's demands. And it will meet them. The textile industry, highly organized for years, is to-day turning out quantities of its products hitherto unheard of, especially for the forces of ourselves and allies. And the textile industry will meet the situation as presented to it. The farming industry—probably the greatest in the world—has combed the country and the city in its search for workers, both men and women, to sow more acres and harvest more bushels than ever before in the history of farming. And it is harvesting those bushels this day. The ship-building industry—need anything at all be said of this industry? You are familiar with it. Every paper rings with its acclaim. In April 1917, no shipbuilding industry of note; to-day our ships seek the waters literally in fleets! Before hostilities broke out with our own country, we built almost no ships. Our commerce, broadly speaking, was done in ships of other nations. Great Britain, one of our most powerful allies, carried much of our shipping. Some was carried by our other allies, and a portion by Germany. Great inconvenience to our business world occurred when the German shipping was suddenly stopped. But we had the help of Great Britain and others to fill the gap. Thus shipbuilding and shipping had good support. And when we entered the war in 1917 our shipbuilding industry was promptly created by government capital. Our ships are launched in fleets! Only 24 days from the laying of the keel to the launching!

The chemical industry do you ask? No less wonderful than the shipbuilding! Relatively small foundation to build on, but has grown to gigantic proportions. The chemical industry is making good! It is not top-heavy. Not going to crumble soon. Held down by sober business men. Held up by American chemists, the best in the world to-day. Upheld, as are all our industries, by the *civilized* peoples of the world. You know what the American chemical industry is to-day. You can not fail to hear about it. We have chemicals to spare—and we are exporting them to those who want them. The chemical industry does not intend to quit when the war is over. Plans are not laid with that in view. Our new and highly developed chemical industry will stick, and no man or group of men will be able to pry it out of its honestly won position.

The chemical industry and the shipbuilding industry may be considered as in somewhat the same positions although there are differences. When war first confronted the world as an actuality in 1914, the United States, Great Britain, France, Italy, Japan, Russia, in fact the world itself, depended almost entirely on Germany for its chemicals. This is true of chemicals in general, but particularly true of medicinal chemicals, in which you are especially interested. The United States depended almost entirely on Germany for the medicinal chemicals! And Germany became an enemy country! American chemical manufacturers rose at once to the occasion. Factories sprung up like weeds, and others greatly expanded. Chemists became sought after, and soon, to the astonishment and satisfaction of all, we were producing in quantities previously undreamed of. The government

did not do this. Government aid has been more recent and mostly in munitions. Individual enterprise produced our great chemical industry.

It is indeed a great privilege to stand to-day so entirely independent. America is proud of her accomplished works, even though impelled to the performance of them by the greatest war of history. And the chemical industry is proud to stand side by side with the shipbuilding industry as one of the new and most remarkable results of the war.

One of the first problems with which manufacturers were confronted was shortage or lack of raw materials. Supplies of raw materials that had given no particular trouble in the past were suddenly shut off. For example, in peace times opium came mostly from Turkey. Its list price was about \$4.50 per pound and manufacturers were familiar with its behavior in their laboratory processes. But Turkish opium suddenly became unobtainable and prices rose to \$20.00 or even \$30.00 per pound. Persian opium came into the market. It is somewhat different in its nature, so that processes of manufacture of opium preparations had to be revised. One interesting feature of this example is that from Persian opium plenty of codeine is obtainable, whereas less is yielded by Turkish.

Coca leaves came mostly from Java. Supplies became obtainable with difficulty because shipping was so limited. South American leaves again came into the market, necessitating in turn changes in the processes of manufacture of preparations from coca leaves, since the leaves from various sources are different in their make-up.

Cinchona affords another example of difficulties encountered with raw material. The Dutch owners of the East Indies, the principal source of cinchona, have placed its sale on a restricted basis by means of licenses. It was difficult and expensive enough to obtain supplies heretofore, owing in part to limitations of shipping, but it is more so now.

Pharmacy, happily, consumes relatively small amounts of potash, but has, nevertheless, suffered to a considerable extent from shortage of potassium salts. All potash came from Germany in the past, but many new sources have now been found. They are, as yet, too limited in their output to meet our national requirements fully, although the demands of pharmacy and medicines are being met reasonably well now. Because Germany had potash to sell she told us to use it. And because she told us to use it we did so. Its use was not really so necessary in pharmacy and medicine as we allowed ourselves to think. Physicians now tell us that in general the corresponding sodium salts are just as useful therapeutically, in fact in many cases are preferable. Of course they are cheaper, and for the two reasons, usefulness and cost, sodium salts should be employed wherever they can be. But we should also use them because by so doing we release an equivalent amount of potash for war purposes.

Manufacturers that were successful in obtaining their raw materials, even though with great effort, were even then by no means in smooth waters. Apparatus is constantly needed both for renewals of the present equipment and for manufacture of new articles. We were surprised to have the war bring to our attention the fact that much of the apparatus used in chemical manufacturing came from enemy countries. This was especially the case with glassware, porcelain ware and stoneware, but to a great extent also with enameled iron and other wares,

particularly acid-resisting wares. You will readily see what a great demand and burden was suddenly thrown upon our makers of glassware, porcelain ware, and stoneware. Many new and very extensive, as well as most urgent, demands were made upon them. And our foundry men too, producing the great pans, kettles, vacuum dryers and such, encountered orders for supplies entirely beyond their ability to supply promptly.

No doubt the experience of Merck & Co. in getting apparatus for renewals and for new work was similar to that of other manufacturers. It was simply necessary to wait for many of the pieces required. Thus plans for making new products were formed, methods of manufacture worked out, buildings erected, raw materials provided, outlets for the finished goods arranged, and all were then held up for an indefinite period while waiting in line for turn at the factory of the apparatus maker. These almost interminable waits for apparatus were exasperating, to say the least. It is very much like being all dressed up and nowhere to go. Weeks elapsed, then months. An important piece of machinery ordered in November not yet obtainable in August!

But there were good and sufficient reasons for all this waiting. New industries, those of the apparatus makers, were being born or recreated in the United States. They are now with us strong and sturdy. Long may they live!

Given the raw materials and apparatus, men and women, skilled and unskilled, are required. The labor question arises. Long before our country entered the war there was such a demand for labor that employers were alarmed. The allies were making such great demands on us for food, munitions, clothing and supplies in general that our laborers were in unusual demand. It was difficult to find a man to stick to any task for more than a brief period of time. There was much shifting about from one employer to another, thus creating great uncertainty in factory production.

With the calling of the United States Army the difficulties, of course, greatly intensified. Factories sent their best men with willingness and eagerness to the army and navy, displaying with proper pride the service flag of our country. But the problem of renewing the forces of chemical labor had none the less to be met. The problem has been met, and is being met daily, but it is one of the real problems of chemical manufacturers. Chemists, engineers, mechanics and skilled help in general were properly included in the draft. Many volunteered, others were drafted, so that from day to day the manufacturer's personnel was apt to change. So much uncertainty arose as a result of this that production was seriously threatened. Finally, however, the government came to our assistance. To-day unskilled labor is employed through government agencies; and chemists for important work in essential industries are returned from the ranks of the army to the ranks of the industries.

Chemicals, even medicinal chemicals, produced from suitable raw materials, in proper apparatus, by conscientious labor, are of small value unless containers in which to sell them are available. And the problem of containers has been a trying one. Bottles are very difficult to obtain and supplies must be arranged for well in advance, even several months in advance of requirements. Tin cans became very uncertain, because the war's requirements on tin must of necessity be met before any other. Cartons, carboys, barrels, boxes, and in general all

containers demand special consideration. And, in addition, much larger quantities of them are needed; to such an unusual extent have demands for the products of our own country increased.

How ship your products to your customers? Not by freight; not by express; for both these are greatly congested and positive embargoes abound. The mails are useful for small shipments, autos for short haul shipments only. It became necessary to employ a representative, who could be in Washington or elsewhere as needed, for the purpose of demonstrating to those in authority over questions of shipping, that medicines, and, especially medicinal chemicals, should have preferential treatment. The *sick* are waiting! Delays in shipping such material as medicines should not be allowed, much less required! Orders giving your products priority over other less essential shipments had to be earnestly sought. Such priority orders became obtainable but only after due effort. It developed into a real burden, however, when such special efforts were necessary in order to obtain each shipment of your raw material, your coal and your containers; and in addition to send out each shipment of your finished products. Lately this matter has been greatly cleared up and medical and surgical supplies, as well as the essentials for their production, are given proper priority. It has been a great relief.

Just at the moment when many of the troubles above related had, by dint of strenuous and concerted efforts, been overcome, or had at least been put in temporary abeyance, the telephone brought the startling news to Merck & Co. that "at five o'clock *to-day* the electricity for your motors and machinery will be shut off until further notice." It was the voice of the Public Service Corporation that spoke. Of course, they could not furnish current, because the ice was so thick that the coal barges could not get up the river to their power house. And besides there was no coal to come up the river. Priority orders for coal had failed to materialize for the Corporation that lights our houses and our streets, that propels our street cars and that turns our motors. Twenty minutes' notice to give up electricity! And our works running night and day!

I would not have you think that there is in all of this any tendency to find fault or to complain. Such is not the case. The situations as they arise singly and collectively in the American chemical industry are new, and they have to be met. They are being met! And met successfully! And it is in this success that we find pleasure in striving. And pride in our accomplishments. Let the government commandeer all the acetone in the country. We'll make our chloroform from something else. Let them send their questionnaires. Let them have our ammonia and our acetic acid, and anything they need. The chemical industry of America is working for and with the government, not in spite of it. They ask for a milligecans of ether to be ready in a few days! They want thirty-eight million pius! There is an urgent call for five hundred thousand bottles of carboic acid. All together with a will and the demands shall be cheerfully met. For does not every American here with red blood in him know that every such deed *accomplished* helps to defeat the hated enemies of our country in their desperate efforts to impose their ghastly Kultur on America, even as they have already imposed it upon Belgium!

PROBLEMS OF THE MANUFACTURING PHARMACIST DIRECTLY
RESULTING FROM WAR CONDITIONS.*

BY C. H. BRIGGS.

Manufacturing pharmacists, like all other manufacturers, have encountered some serious problems resulting from the War. Some of these problems have been solved but others are becoming more serious. The encouraging part of it all lies in the fact that we are facing these problems squarely and doing things now that we would have thought impossible before the war.

One of the most serious problems which confronts us at the present time is the shortage of chemists and pharmacists and the loss of our trained and skilled men. This is becoming very acute, and as the war goes on, it will become more and more serious. Skilled chemists and pharmacists are indispensable for the proper manufacture of pharmaceutical products. They are necessary for manufacturing, for assaying and control work, and for research. The Government has generously provided for exemptions for chemists to control products being made for the Army and Navy. But experience shows that even men so exempted frequently believe that they are not doing their full duty to the Government and later enlist for war work. This is particularly true with research chemists, and research work is necessarily much reduced at present.

In the past there have been a large number of chemists and pharmacists graduated every year from our many universities and colleges. This source has supplied our increasing demand for such men, but under present conditions comparatively few men are being graduated as chemists and pharmacists, and even these are wanted for war work as soon as they are ready. We are really facing a serious shortage in chemists and pharmacists and both men and women should be urged to take these courses and carry them to completion, as they will be greatly needed in the future.

A second problem that confronts us is the increase in the cost of the various products that we manufacture. I do not recall a single item that can be made for anywhere near the same cost it was made for before the war and many products cost several times as much. This is due of course to several causes:

1st. Increase in cost of crude drugs, chemicals and raw materials due to the scarcity of these products.

2nd. Increase in cost of labor.

3rd. War taxes, for these must necessarily be added on to the cost of manufactured products if the manufacturer wishes to continue in business.

If to the total of these costs is added a fair profit for the manufacturer and then the increased freight and express charges, is it any wonder that the druggist is surprised at the cost of his goods, or that the consumer thinks he is being robbed when the druggist has added on his cost and profit? But these are war times and we are coming to expect higher prices on everything we buy and we are never disappointed.

A third problem that has been acute ever since the war started is the shortage of certain drugs and chemicals. Drugs which are produced only in Germany, Austria and Turkey are now practically out of the market, while drugs which were

* Read before Scientific Section A. Ph. A., Chicago meeting, 1918.

produced in Russia, France and Italy are obtainable in limited quantities. In fact crude drugs from all foreign sources are scarce and high priced. Some crude drugs which are unobtainable from usual sources are being supplanted by similar drugs from other sources—as for example in place of Russian Ergot, Levant Scammony and Turkish Gum Opium, we are now able to obtain Spanish Ergot, Mexican Scammony and Persian Opium. Genuine Liquid Styrax is practically out of the market, but a similar gum from South America is quite plentiful and is being used with satisfactory results.

There is a real shortage of some of the rare alkaloids. Arecoline Hydrobromide, Physostigmine Salicylate and Scopolamine are unobtainable. Sparteine Sulphate and Pilocarpine are very scarce. Atropine is being produced in this country and is becoming more plentiful. Other alkaloids are all very high in price.

The shortage in pharmaceutical chemicals is improving steadily and thanks must be extended to American manufacturers for their earnest efforts to make these chemicals. At times important chemicals have been practically unobtainable, as for example—barium peroxide, benzoic acid, resorcin and cinnamic acid, but American chemical manufacturers are now making a good quality of these chemicals in sufficient quantities to supply the demand. Prices, however, are still high. Cinnamic acid, for example, was plentiful before the war at \$1.00 per lb. Not long ago it sold at nearly \$20.00 per lb., but can now be obtained at \$10.00 per pound.

Potassium salts have necessarily been scarce and much in demand ever since the war started, as Germany was the principal source of their supply. Limited quantities are now being produced in this country, but hardly sufficient to supply the demand. The U. S. P. IX has provided alternate formulas for certain preparations such as Bland's Pills, Compound Solution of Cresol, etc., so that sodium salts may be used where potassium salts were formerly employed. These formulas work satisfactorily and products so made give the same therapeutic results.

Another problem which is rapidly becoming very important is the conservation of glycerin, sugar and alcohol. In the past manufacturing pharmacists have used these items freely with only the thought in mind of producing the best and most stable pharmaceutical preparations possible. But with the increasing demand for glycerin for war purposes, the present shortage of sugar and the high cost of alcohol, manufacturers have been curtailing the use of these items wherever possible. In some products, where glycerin has been used freely, it has been entirely eliminated and replaced with the equivalent amounts of sugar. In others, where the glycerin was necessary for preservative purposes, some preservative has been added. Glycerin, alcohol and sugar are very important in most preparations for their preservative properties and for their action as solvents, and it would be false economy indeed for manufacturers to so restrict their use that the preparations would eventually ferment or spoil with a total loss of all the ingredients. There has been some consideration of placing government restrictions on the use of glycerin and sugar in pharmaceutical preparations, but such restrictions would be apt to lead to much greater losses in the spoiling of finished products, and it is to be hoped that such restrictions will not be imposed until they are found to be absolutely necessary. When we need drugs and medicines,

we want the best, and we can better afford to curtail on candy, sodas, etc., than on drugs and medicines.

In some of the U. S. P. preparations the use of glycerin could be readily eliminated, as, for example, Fluidextract Cascara Aromatic, which contains 20 percent of glycerin, and Syrup of Hypophosphites. The fluid glycerates might well be dispensed with until after the war, and fluidextracts used instead. Such changes would be of real value and help to reduce the consumption of glycerin materially.

As a final problem, I might mention the difficulties in transportation both in obtaining supplies and in shipping finished products. Delays of this kind are very annoying, both to the manufacturer and to the consumer, but we must expect such delays and so regulate our affairs as to produce as little inconvenience as possible.

In conclusion, then, we would ask for all the help you can give in increasing the number of graduates in chemistry and pharmacy, in regulating your selling prices to conform to the present cost of goods, in avoiding unwise restrictions on the use of sugar and glycerin and alcohol in pharmaceutical products which are liable to spoil, and in allowing for delays in transportation in ordering your supplies.

ANALYTICAL AND CHEMICAL RESEARCH DEPARTMENT,
PARKE, DAVIS & CO.,
DETROIT, MICH.
July 31, 1918.

THE CONSERVATION OF CRUDE DRUGS.*

BY HUGO H. SCHAEFER.

Much has been said and written of late regarding the conservation of glycerin, alcohol, syrup, etc., products which are used as solvents for drugs and their active principles, but practically nothing has been said about the conservation of the crude drugs themselves. To-day there is a shortage of very many botanicals, some are practically unobtainable, others are scarce, and all have increased more or less in price. These conditions are due partly to the shortage of help restricting the collection, partly to the enormous quantities bought by our and the allied governments, but largely because Europe is the habitat or source of supply of a great many of our official drugs. Much, of course, has been done to overcome this shortage by encouraging both the collection of native drugs as well as the cultivation of drugs which up to the present time were chiefly imported from Europe. Nevertheless, any means which might conserve the supply at hand ought to receive attention.

It has come to the author's attention that drugs often contain a much higher percentage of active constituents than the U. S. P. requires. Many official drugs will contain only slightly more than the requirements call for, but some may be obtained on the market which contain entirely too much active constituent. Jalap, for instance, has been found to contain as much as 15 percent resin instead of the 7 percent required, ipecac with 3 percent soluble alkaloids instead of

* Read before Section on Commercial Interests, A. Ph. A., Chicago meeting, 1918.

1.25 percent, cultivated belladonna, stramonium and hyoscyamus are often found to contain more than double the required percentage of alkaloids.

What happens when such drugs are dispensed? If the drug is assayed it will probably be sold per unit of active constituent for manufacturing purposes. But suppose the manufacturers cannot absorb all of this high quality drug or suppose it is sold to the retailer without assay, naturally the drug or its preparation, when dispensed, will be considerably over strength and the patient will receive an overdose of the drug. This overdose may or may not be harmful, but in either case the excess of drug is lost—is wasted. How much is wasted in this way is hard to estimate, but of 100 assays of various U. S. P. drugs made by the author during the last few months the average drug was found to be 23 percent higher in active constituent than is required, showing that 23 percent of these drugs would be wasted if dispensed by the druggist in any form without first being assayed and adjusted by some means.

How could this be overcome? The U. S. P. in its directions for making tinctures for which assays are given, directs that after an assay has been made the volume of the unfinished tincture should be so adjusted that the finished product will contain a certain quantity of active ingredient. In other words, if a druggist desires to make tincture of hyoscyamus he must purchase an assayed drug containing not less than 0.065 percent alkaloids and after the tincture has been made he must assay it and adjust it so that the finished tincture contains not less than 0.0055 Gm. and not more than 0.0075 Gm. alkaloids in 100 mils. How many pharmacists are in a position to do this? And yet if it is not done the preparation may be too strong, the patient may receive an overdose and the excess of drug may be wasted. Would it not be much better to adjust the strength of the powdered drug? Would it not be more practicable to allow the wholesale druggist or the crude drug merchant, after assaying a drug and finding it above strength, to adjust it by diluting it down with some inert material? Then all assayed drugs of the Pharmacopoeia would be uniform and the overdosage and waste would be eliminated. A pharmacist could buy such a standardized drug from a reputable house and after making his tincture carefully, would be sure that the percentage of active ingredient in the finished preparation would fall within the limits required by the U. S. P. Such tinctures would then truly represent a 10 percent preparation of a standardized drug and one mil of a fluidextract would correspond to 1 gramme of the drug and so with all other official preparations.

Of course, immediately the argument might be brought forth that if such dilution of powdered drugs were allowed, it would simply afford another means for the unscrupulous dealer to market inferior products, but upon further consideration it may be readily seen that diluting drugs with inert material is no different from mixing high grade drugs with low grade in order to obtain a product of exact U. S. P. strength and such mixing is no doubt done every day and is considered legitimate. Or again, it is no different from diluting a fluidextract made from a high grade drug with additional alcohol or menstruum to bring it down to the proper strength as the U. S. P. directs.

No doubt many firms have been in the habit of diluting powdered high grade drugs with extracted drugs or other material, but it is the object of the author in writing this paper to bring about a discussion which may help towards making

this, at present questionable procedure, legal. In the opinion of the author more uniform drugs and preparations could be obtained; overdosage could be prevented, large quantities of drugs could be conserved and incidentally money could be saved. The druggist could make his preparations without being required to assay them and to adjust them, if the diluting of assayed drugs with some inert material were officially sanctioned.

DISCUSSION.

C. O. EWING: This is a question upon which I cannot speak officially and my remarks must be so accepted. It is true, that there are some points in favor of such a procedure; one point mentioned was that it would enable the average pharmacists to make preparations which would not require standardization, if otherwise properly prepared. This might be so, if great care was invariably exercised, but we must admit that there are in the profession some people who cannot be made to be careful at all times, and I am of the opinion that there is no fool-proof method of securing an absolute uniformity of standardization. I think in the preparation of U. S. P. products of which standardization is required it should be done.

C. H. LAWALL: It seems to me that a solution of this problem, as to whether or not it is proper, may be found in the statement made in the Preface to the Pharmacopoeia, which is for the guidance of the manufacturer and the retail druggist who choose to take advantage of it, to the effect that when a product conforms in character to the standards of the products made by the official method, it may be made by any other method. The official procedure need not be followed provided the end products conform to the official requirements.

A. R. L. DOHME: I want to point out one thing that occurs to me in connection with this paper. Everybody who has percolated drugs to any extent knows that, given a drug of a certain alkaloidal percentage for percolation it is practically impossible to secure by any percolation method known an absolutely correct product containing all the contents of that drug. Standardized drugs have their undoubted advantages in many ways, but the uncertainty of a percolation securing all the alkaloid or active principle makes the preparations of them to that extent uncertain.

C. O. EWING: It occurs to me, regardless of how we prepare the finished product, the scientific way is to standardize that. The standards for crude drugs in the Pharmacopoeia are purposely much lower than we can ordinarily expect, because if they were placed too high a large quantity of the drugs would be of so low a standard that they could not be used. The scientific way is to standardize the end product.

J. P. SNYDER: I have read the statement that Professor LaWall refers to, but I think that has reference to the manufactured preparation and not to the crude material.

J. M. FRANCIS: I think the gentleman has overlooked one of the most important features connected with drug conservation. He perhaps refrained from referring to this phase of the matter purposely, but it seems to me that, under the present conditions, one of the most important things before this Association is using its influence in some measure for bringing about certain changes in the specific use of such drugs as belladonna, digitalis, and perhaps others. That digitalis leaves should be gathered from plants of the second year's growth was changed in the U. S. P. IX, and I think the former provision was needless and wholly unnecessary, provided the drug is properly handled and cured and stored. I have seen belladonna grown in the United States better than was ever imported from Europe. It assays in many instances three times the standard required by the Pharmacopoeia. The Pharmacopoeia specifies belladonna leaves containing not more than 20 percent of stems. I have seen belladonna stems with alkaloidal content far above the standard. Why then force the belladonna growers of this country, the drug buyers or the drug manufacturers, to discard such a large portion of this available plant? The same applies to other drugs.

C. H. LAWALL: I can see no reason why such stems should be discarded.

C. O. EWING: I understand there is some demand in the trade for belladonna stems at the present time; but I may say that, recently, belladonna stems have been released by the Department.

H. V. ARNY: I make a motion that this paper be brought to the attention of the U. S. P. Revision Committee.

J. M. FRANCIS: I am sorry the gentlemen have failed to get the drift of my remarks. It comes back to the matter of economy and conservation after all. The suggestion as to the use of the stems of belladonna is exactly in line with the idea of using corn for feeding chickens instead of feeding it to human beings. Valuable grain should not be used for stock food when it is needed for feeding people. The alkaloids are present in the belladonna stems and the stems should be used in the best possible way, and I maintain that the idea of conservation would require that they should be used in the same way as the leaves are. What I have said does not apply to the importation of the drug from abroad. I am talking about the conservation of the drug grown in this country.

C. O. EWING: I think the provisions of the Pharmacopoeia cover this question, if the end product is of standard strength.

CHAIRMAN R. P. FISCHER: I make this suggestion; that instead of referring the paper to the Revision Committee it be referred to the Committee on Conservation that is to be appointed. We have asked the Council to appoint a Conservation Committee, and through this Committee it will also reach the Revision Committee.

H. V. ARNY: Then I make the motion that Dr. Schaefer's paper be referred to the Committee on Conservation.

A. R. L. DOHME: The Committee on Standards of the American Drug Manufacturers' Association has made a definite recommendation to the Revision Committee that in the interests of the conservation of belladonna the official requirements of belladonna, instead of being confined to the leaves with a certain amount of stems, include the whole plant. This, I think, should apply to henbane and other drugs as well as belladonna.

C. O. EWING: Right now I am thinking of a drug that should be included—*ipecacuanha* and *ipecacuanha* stems. The U. S. P. VIII specifies that the stems can be of certain length—I don't recollect the exact figure—and the present Pharmacopoeia specifies 5 percent of stems. Within the past year quite a number of samples of *ipecacuanha* and *ipecacuanha* stems have been assayed in the Department, and in a number of instances we found that the stems contained more alkaloid than the root itself. It is waste not to use a valuable product.

A. R. L. DOHME: Nearly fifteen years ago I presented a paper before the Scientific Section of this Association in which I proved that the stems of *ipecacuanha* were richer in alkaloid than the root, and, at that time, I recommended to the Revision Committee the inclusion of the stems of *ipecacuanha* as well as the root. In that same paper I brought out the point that the *Carthagenia* *ipecacuanha* was even more rich in alkaloids than the *Rio*, which was the only one officially recognized, and the Revision Committee, in its wisdom, adopted the idea of making the *Carthagenia* official as well as the *Rio*. I contend that the stems should be made official as well as the root.

C. O. EWING: There is no question at all but that we have the finest pharmacopoeia extant, but there is still room for improvement. It needs some revision and it is needed now. I do not think that we should wait as long as we ordinarily do for the next revision.

C. H. LAWALL: We are working on the Supplement now, which we hope to have ready at the time of the next Convention. If any of you gentlemen have any specific recommendation please send them in to the Revision Committee as soon as possible.

The motion to refer the paper under discussion to the Conservation Committee was adopted, and also a motion by A. R. L. Dohme requesting the U. S. P. Revision Committee, if possible, to issue the Supplement, covering important items, during this year. Other subjects of conservation, not closely related to the paper, were presented; these will be reported in the minutes of the Section.—
EDITOR.

THE ADVANCE BY KILOMETERS.*

BY H. V. ARNY.

Recently a friend of the writer, requested to subscribe to a war-fund in the guise of "a mile of dimes," responded as follows:

While I heartily approve of your fund, I disapproved with equal heartiness of the way in which the money is raised. To an ardent metricist like myself the

* Read before Section on Commercial Interests, A. Ph. A., Chicago meeting, 1918.

securing of miles, yards and feet of dimes is objectionable. I find a dime measures 18 millimeters across and I therefore take pleasure in subscribing to 900 millimeters of dimes and enclose my check for \$5.00 covering this length.

The above problem affords a peculiarly pertinent comparison between metric and our Elizabethan Standards. The measuring of a dime with calipers shows its diameter as exactly 18 millimeters, or about $\frac{23}{32}$ of an inch. Neither figure is a convenient one for calculations and yet despite this handicap note how much simpler is the metric arithmetic than is the figuring by the old standard.

Mentally we can calculate:

| | |
|--------------|---------------|
| 18 mm. | = 10 cents |
| 90 mm. | = 50 cents |
| 900 mm. | = \$ 5.00 |
| 9 meters | = \$ 50.00 |
| 9 kilometers | = \$50,000.00 |

And one kilometer (or one-ninth) represents the repeating decimal \$5.555.55 $\frac{5}{9}$. Now for "the mile of dimes."

Mentally we may calculate:

$$\begin{aligned}\frac{23}{32} \text{ inch} &= 10 \text{ cents} \\ 23 \text{ inches} &= \$3.20 \\ 12 \text{ inches} &= \frac{12}{23} \times \$3.20\end{aligned}$$

and there our mental arithmetic stops and we have to turn to multiplication and to long division:

$$\begin{array}{r} 3.20 \\ 12 \\ \hline 23)3840(1.67 \\ 23 \\ \hline 154 \\ 138 \\ \hline 160 \\ 161 \\ \hline \end{array}$$

to find that one foot of silver dimes equals \$1.67 which the promoters of the scheme call \$1.70 to 17 dimes. Having gotten one foot, let us take paper and pencil and calculate the mile of dimes. An easy job for a summer siesta; merely multiplying \$1.67 by 5280:

$$\begin{array}{r} 5280 \\ \$1.67 \\ \hline 36960 \\ 31680 \\ 5280 \\ \hline \$8817.60 \end{array}$$

Thus, through much tribulation, we arrive at the fact that an English mile of American dimes will total \$8,817.60.

As I understand the request of the chairman of this Section, his desire was a paper on how the metric system was capable of winning the war. In one sense the war is being won by the metric system, for thank God! the news now coming to us shows that our brave boys and the boys of our allies are winning the war, kilometer by kilometer. To this it might be added that the winning of the war by the allies would have been an easier task had all of us, English and Americans, as well as French, Belgians and Italians, spoken the universal language of weights and measures, the metric system. This is shown by the request of the French authorities just after we entered the war that we pitch in and manufacture the 75 millimeter gun rather than continue with the regulation United States gun of somewhat similar calibre.

But my intention is not so much to discuss what the metric system is doing to win the war for us Americans, as what the war will do toward making this a metric country.

There is not one of our group of ardent metricists who is advising the arbitrary changing of standard in this period of storm and stress. That the operations in France will bring about a trend toward metric units, especially in the machinery trade, is apparent, as for instance the adoption of the 75 millimeter gun. In fact only a month since a gentleman manufacturing taps and dies—a line that constitutes an anti-metric stock argument by the way—told the writer that over half of the screws and nuts that he is now turning out are on a metric basis. That the millions of our boys and our war workers will come back from France thoroughly familiar with metrics, and therefore metric advocates, goes without saying. And the advance of the Allies by kilometers, as read in our daily press, will gradually educate our general public to understand that meters, liters and grammes are not the fantastic creations of cob-webby brains, that anti-metricists would have us believe.

In conclusion, a word on scrapping. The best "scrappers" of all, the anti-metric protagonists hold before the eyes of their supporters, notably in the machinery trade, the awful consequences, the financial ruin, that awaits them, should the metric system become generally used in this country, by reason of consigning valuable machinery to the scrap heap.

The argument is as foolish as are most half-truths. It is about as reasonable as to argue that it is good business to continue to use a soda fountain of the vintage of 1890 instead of buying a modern sanitary apparatus because forsooth the scrapping of the antique "fizz squirter" will mean the loss of a few hundred dollars.

It is on a par with the short-sighted policy of most American coke oven operators prior to the war in refusing to scrap their archaic "beehive" plants and as a result we all know that the beginning of 1915 found us confronted by a coal-tar famine.

The "beehive" ovens were scrapped that year and were replaced by "recovery" ovens at great expense, but that expense has been paid several times over since then by the increased profits accruing from the saving effected by recovery-oven operation.

A final instance of scrapping that may be cited is one affecting the tire indus-

try. A year or so ago, the writer discussed with a scientific friend connected with a great rubber corporation, the campaign of education carried on by the American Metric Association and found a sympathetic listener, so sympathetic that the gentleman in question took up the matter with the executives of his company. Later he reported that the officials hesitated about taking a stand favoring the metric system as a change from old standards to metric ones would mean thousands of dollars of molds consigned to the scrap heap. Again we were confronted by the scrapping bugaboo.

It was therefore with surprise and interest that the following news telegram was noted in the daily papers:

Washington June 28. Immediate reduction in the number of types and sizes of automobile tires from 287 to 32 has been determined upon by automobile tire manufacturers in accord with recommendations of the Conservation Division of the War Industries Board. Under the program announced to-day, by Nov. 1, 1920, all but nine types and sizes will have been discontinued.

Here is a case of wholesale scrapping in the service of efficiency and economy engaged in by the same business men who a year since disapproved of scrapping tire molds. As in this case, the adoption of the metric system will mean some scrapping, but it will mean scrapping in the service of efficiency, and economy and in the conservation of time; the most important asset that we possess in these stirring days.

POWDERED IPECAC.

SHOULD IT BE RECOGNIZED IN THE PHARMACOPOEIA.*

BY WILLIAM W. DAVIES.¹

The Government has been in the market for supplies of Powdered Ipecac and recent assays made at the Chemical Laboratory of the Medical Supply Depot, U. S. Army, New York, N. Y., have invariably been of high test drug. As a result of this, it occurred to the writer that a standard, giving the maximum percent of ether-soluble alkaloids which should be found in Powdered Ipecac, would not only help to conserve the supply of this drug but also would insure a greater uniformity in dosage and in the products compounded with it.

The U. S. P. IX, which gives a minimum requirement of 1.75% ether-soluble alkaloids for the "whole drug," but sets no maximum limit, does not recognize Powdered Ipecac.

Samples of the "powder" tested here have assayed as high as 2.45% alkaloids, or 40% stronger than the minimum requirement of the U. S. P. IX for the "whole," namely, 1.75% alkaloids.

In Circular No. 6, issued August 1918, the War Department asked for bids on 500 pounds of Powdered Ipecac. If this should have been furnished with 2.45% of alkaloids it would be equivalent to 700 pounds of the drug testing 1.75%, in other words there would be 200 pounds of Ipecac taken out of the market unneces-

* Authority granted to publish this article by the Board of Publication of the Surgeon General's office, U. S. Army, October 25, 1918.

¹ Sergeant, Medical Department, U. S. Army.

sarily and needlessly, permitting \$850.00 worth of Ipecac to be wasted as well, unless it is diluted to the minimum standard before using or the equivalent taken.

Again, unless the high-test drug was diluted by the pharmacist using it, or an equivalent amount taken, which is considered doubtful, as war-time circumstances might not permit of it, the product he would compound from it, as say Dover's Powder, might vary 40% in Ipecac alkaloids from the same product compounded with drug testing 1.75% alkaloids. This is a variation much greater than the U. S. P. intends to admit of its products and one which in some cases might produce a dose possibly contraindicated in a patient to whom it is given.

For all of the above reasons, therefore, it is concluded that Powdered Ipecac should be recognized in the U. S. P. and that a maximum requirement of 2% ether-soluble alkaloids, equal to the standard of the International Protocol, should be established. Thus Powdered Ipecac would be standardized to contain not less than 1.75% nor more than 2% of ether-soluble alkaloids. A precedent for this is seen in the U. S. P. IX in the case of Opium, which like "whole" Ipecac is used only in the manufacture of standardized products and, therefore, has merely a minimum requirement. Powdered Opium, on the other hand, which is comparable to Powdered Ipecac, is "finished product" and has both minimum and a maximum standard.

ADVERTISING PHARMACY TO PHARMACISTS.*

BY J. C. PEACOCK.

To-day, one of the most regrettable facts is that pharmacy needs to be constantly advertised to some of us as a thing worth while as a business or, as a means of building business with other things.

Every drug store trades on the reputation of pharmacy, but its right to do so is only in direct proportion to the thought and care which is bestowed upon the department of pharmacy which the establishment includes. Whether the pharmacist has one side-line or a thousand and one is his own affair, provided he does not neglect pharmacy. That some make successes of all of their departments is readily understood when we discover their close attention to details and methods of watching the progress of affairs within the departments. They also have the good sense to limit their departments to those which do pay. But there are only a few individual proprietors, in pharmacy and other lines, who are endowed naturally with or have cultivated this ability to such a degree of perfection as to derive a commensurate profit from many lines.

For this simple reason of human limitation—the individual can only do a few things well—pharmacy needs to be advertised to pharmacists to save us from the distraction of an alluring commercialism that to some seems imperative to financial success.

In conducting an average pharmacy for a number of years there is sure to accumulate a certain amount of side-line business which fits into the trade with more or less ease; but, beyond such, to search for further varieties seems to the writer like misdirected effort on the part of the proprietor upon whom will probably devolve the constant supervision of this stock. For, unless lines are found

* Read before Section on Commercial Interests, A. Ph. A., Chicago meeting, 1918.

which can be handled expeditiously and without much extra help and effort, serious inroads are made upon the pharmacist's time and thought, both of which, we believe, can be more profitably devoted to affairs of a pharmaceutical nature.

It is not clearly understood why men and women, after taking the trouble to educate themselves and graduate in pharmacy will, when embarking in business, intentionally enter into lines of merchandise in which all may compete; whereas, their special training has been to fit them to undertake a line of work in which there is a measure of restriction from competition, because of the training required. Competition must certainly be less in an art that is looked upon by the public as requiring a special training in addition to ordinary commercial ability, than in the handling of a line of commodities which the public looks upon as a mere exchange of goods for money. But do we as pharmacists appreciate this thought? From this viewpoint, if acceded, it must seem credible that each individual effort to improve and extend the practice of pharmacy helps just that much to remove it from the bewildering competition which besets plain commercialism, and tends to shield pharmacy from competition with any other line now carried in the drug store, or contemplated as addition. If we could but see beyond this perplexing question we would perhaps view what hope pharmacy has in the future. There is little doubt that the temptation to imitate what looks like prosperity is the influence which leads some to start off with a burden of side-lines; while others are impelled by a distrust of the possibilities of pharmacy itself ever becoming a paying business. One or the other of these influences is likely to prompt him who is about to venture upon the uncertain sea of proprietorship. While we should not deny him the right of apprehension, we should ask him to give pharmacy at least an equal chance. Though we cannot see past this perplexity, we get a reflected light of encouragement from beyond it—the light of material success that shines from the loyal efforts of those who having confidence in pharmacy as a necessity are living up to the requirements of it as the prime factor in the drug store. That they do this for profit is no secret with them nor with their customers. That they derive a profit is because they apply to pharmacy the same attention and rules of finance which they use on the strictly commercial side-lines. They have found that a profit can be had from pharmacy if the same quality of thought that is given to the promotion of those side-lines requiring special effort is devoted to the development of a pharmaceutical department. These men figure pharmacy into finance and finance into pharmacy; their attention is on their business; they are keen to learn, to know and to act; they know the cost of production; they know the “millstone about their neck,” called “overhead,” they are aware of wastes in time and effort as well as in materials; they study losses, and what cannot be eliminated is figured into expense so it can be met. They utilize their time and talents to learn all of this as the only safeguard against a diminishing profit. They build up their stock of drugs to meet the demands of their trade as to staples, new items and preferences; they insist on quality in what is left to their discretion because eventually it bears their names. They are attentive to the wants of their pharmacy customers, and render service that shows an appreciation of the patronage they receive; and yet they do not belittle their services by giving them away for fear of competition, for each of them has been convinced by results that the better pharmacist he is the less he need to concern himself about competition,

as the term is generally accepted. To them the outcome of all of this is worth the effort.

Then must these be the reasons, though only the homely ones of interest and attention in varied forms, why pharmacy develops in some establishments and why it fails to flourish in others? But we want to discuss the latter phrase in words that pertain more directly to such barren fields. It is reiteration, we know, but does not the neglect of one or more of these simplicities which foster pharmacy constitute a reason why the art becomes unpopular with some of its votaries? To such, we quote "Poor Richard,"—"Keep your shop and your shop will keep you." Indeed the persons who enter a shop for pharmaceutical merchandise or service may fail to find the pharmacist, although his material body stands before them, because some side-line, either within or outside of his store, so preoccupies his attention that he fails to represent pharmacy. Perhaps he does not realize that through lack of interest he is losing an opportunity to advertise pharmacy to the public for his own immediate good, to say the least.

The pharmacist, who does not appreciate that he has a chance to turn his skill and time into money by developing his pharmaceutical department, needs to be told to study anew the opportunities of an art that but awaits his efforts. Let him not fail, as many do, to count the employment of his time, his very life, as of real value, whether it be devoted to the making of a preparation dispensed to-day or in the future. For failing to do this is to inflict a hardship, both upon himself and upon his brother pharmacist who seeks to benefit all pharmacists by endeavoring to improve the price as well as the service.

And now we see that pharmacy depends upon those who trade upon its reputation for both the preservation of the art and for its further development.

Pharmacy now seems to us a business as well as an art; and it is equally clear that it demands at least side-line common sense to enable it to show a profit. It asks no more; the choice of the direction of your effort rests with you and so accordingly the outcome.

So much for pharmacy as a worth-while business in itself, or as a department properly conducted. But the practice of pharmacy is such a comprehensive service that there is no end to the things which can be done within its province for profit, or of influences which may be caused to emanate from it to the same end.

The ability to handle the most difficult prescription is a means to public estimation which no pharmacist can afford to neglect as a most effectual advertisement, while careful attention to the smallest detail, delegated to the pharmacist, is an indication of his thoroughness and dependability under minor circumstances; attention never fails to become a source of profit to those who are willing to devote it to the cause of pharmacy.

Indeed the practice of pharmacy offers the best advertising medium that the store which houses it and the side-lines affords; it is a service which begets confidence; there is no side-line that will compare to the practice of pharmacy as a builder of confidence among your customers; and confidence, so built, is a great asset, because it is the glitter of an untarnished satisfaction.

Therefore, let us practice pharmacy unceasingly, if for no other reason, than as an advertisement for the side-lines, especially, since its neglect is not adver-

tisement for either side-lines or pharmacy. And again, no matter what the apparent success of the drug store may be, it can be more, if more pharmacy is practiced.

The scarcity of help, and the uncertainty of merchandise are probably now causing many pharmacists to wonder whether they should devote their time and attention to pharmacy or to side-lines. But let them consider that they now have an opportunity to conserve the art during a period of stress from which they must emerge the gainers, if they are true to their trust. While, on the other hand, if they neglect pharmacy and devote its time to side-lines, they will find that they have developed departments of trade into which, later, many must of necessity enter.

So, to the pharmacist who is undecided as to his course, or to him who is looking for a new side-line to boost a lagging business, we advise "take on a little more pharmacy, or, apply a little more time and business thought to what pharmacy you have."

OUR SOLDIER AND SAILOR PHARMACISTS.

TO THE EDITOR OF JOURNAL OF THE A. PH. A.,

PHILADELPHIA, PA.

DEAR SIR:

The A. Ph. A. Pharmacists' Soldier and Sailor Advisory Committee contemplates a really worth-while work. We are determined to find a place for every pharmacist now in the service, and to that end we are going to get in touch with every drug store in the country. More particularly we are going to make an effort to find occupation for every disabled soldier and sailor pharmacist. It will be our effort also to induce those pharmacists who have been engaged in business on their own account to buy a now existing drug store in preference to the opening of new drug stores. Our plans include, with the coöperation of the Association of Pharmaceutical Faculties, to induce every returning pharmacist who has not had the advantage of a Pharmacy College education to acquire one, and where conditions will not permit this, we are seeking to arrange a plan under which every returning pharmacist without college training can have a special One Year Course. In further aid we are working to secure, with the coöperation of the Association of Boards of Pharmacy, the right of Registration in any state where a returning pharmacist may desire to locate on the strength of Registration which he may now have in his home state. The details of our contemplated plans are too many to enumerate here. Our task is an enormous one, for which we will need all possible help.

The Committee will appreciate to have suggestions which may serve it in successfully carrying on its work.

(Signed) FRANK H. FREERICKS,

CINCINNATI, O.,

Chairman.

November 18, 1918.

SECTION ON EDUCATION AND LEGISLATION, AMERICAN PHARMACEUTICAL ASSOCIATION.*

ABSTRACT OF MINUTES OF THE SESSIONS HELD IN CHICAGO, AUG. 14, 15, AND 16.

Chairman C. B. Jordan called the first session of the Section on Education and Legislation to order at 9.30 A.M., Wednesday, August 14, in Congress Hotel, Chicago.

C. A. Dye occupied the chair while the Chairman read his address.

Address of Chairman C. B. Jordan:

Fellow-Members of the American Pharmaceutical Association: This meeting of our Association takes place under most trying circumstances. Never in the history of the American Pharmaceutical Association has a meeting been held when our minds were so fraught with things foreign to Legislative and Educational Pharmacy. The thing that is uppermost in the minds of all of us is this World War. The thing that is most desired by all of us, and which is of the greatest import to all of us is the successful completion of the war. It matters little what we may say or do here, if that end be not attained. But I know that I express the firm conviction of all of you when I say that it will be attained.

Not a man, woman or child in the United States, but has been affected by its far-reaching results. It has been most forcibly brought home to all of us, and we have all been called upon "to do our bit."

American Pharmacy, has, I believe, nobly stood the test, and rendered well her part in this world crisis. The pharmacists of the United States have taken an active part in every Liberty Loan and Red Cross drive, in every Y. M. C. A. and K. C. campaign; in National, State and County Defense. Not only have we sent our young graduates and registered pharmacists to the front, but even young proprietors have entered the service. The drug stores of the country have sold Thrift and War Saving Stamps, have been repositories for French and Belgian Relief, and recruiting stations for Marines.

The colleges of pharmacy have done their part by preparing men for the service with regular and special war courses, by collecting and preparing drugs and medicines, and by even giving members of their instructional forces to the service.

Our young pharmacists have entered every branch of the service—Medical Corps, Engineering Corps, Infantry, Artillery, Navy, Gas Defense, Sanitary Corps, Aviation, and Ordnance Department, and are acquitting themselves well in all places. It was my good fortune to visit the Great Lakes Naval Training Station recently and to talk with the Assistant Surgeon of the Hospital Corps. He recounted with a great deal of pride the achievement of the Naval Hospital Corps, made up almost entirely of graduate and registered pharmacists.

The effects of the war are such that it is impossible to consider our legislative and educational problems apart from them. It has shown us our short-comings and has awakened us, as we never were awakened before, to the realization of our duties to the Nation and to ourselves. A number of years ago the N. A. R. D. attempted to secure recognition for the pharmacists in the Army, but they found that the pharmacists were asleep at the switch, were not interested, and lukewarm toward the movement. How well the war has awakened us. To-day we realize our mistake and are trying to remedy it, but we may have been aroused from our slumbers too late.

Three things, it seems to me, stand out and demand our attention: First, Securing legislation giving recognition to pharmacists in the Army. Second, Closer organization of American Pharmacy. Third, The attitude of the Government, of prominent pharmacists, and of the laity toward professional pharmacy, pharmaceutical education, and colleges of pharmacy. These questions are interdependent and cannot be considered apart from each other, therefore, I will not attempt to consider them separately but will endeavor to touch all of them in this discussion.

The profession of pharmacy and especially the colleges of pharmacy have suffered a cross-fire of criticism all year. Dr. J. H. Beal in "Facing the Facts," and Mr. H. B. Mason's editorials have criticized us for not recognizing that pharmacy has practically passed to commercialism, and our colleges are not, in their estimation, giving sufficient time to commercial subjects, but are

* Papers with discussions will be printed apart from minutes.

going to seed in professionalism which is not needed in present day practice. On the other hand the Government, through the office of the Surgeon General, criticizes us for devoting so much time to commercialism and so little to professionalism. They are painfully frank in their statements and say that colleges of pharmacy are educating mercantile clerks for the retail pharmacists of the country.

So we are criticized on the one hand for giving too much time to one phase of pharmacy, and not enough to the other, and criticized on the other hand for giving too much time to the other and not enough to the one. The colleges are placed somewhat in the position of the husband whose good wife scolded him if he did things and also scolded him if he didn't do them. He remarked, "It's mine coming or going, for I get Hell if I do and Hell if I don't." Ordinarily such criticisms are passed by as not having sufficient basis in facts to be worthy of serious consideration. However, coming from the sources that these come from, and with the acridity with which they are uttered, I believe they deserve our consideration.

There is one serious criticism of pharmaceutical education and of colleges of pharmacy that we all can agree upon, and that is that pharmaceutical education is not built upon a good, strong foundation and that our colleges are not demanding sufficient preliminary training of the entering students. It matters not whether the education of the pharmacist should be along commercial or along professional lines, this criticism still holds, for no true education can be built upon a poor foundation. The student who wishes to secure a college education along any other line finds that he must at least have a high school education before entering college. Medicine, Dentistry, Veterinary Science, Law, Commerce, Liberal Arts, Engineering, and even Agriculture, demand a high school education for entrance. Pharmacy stands alone in not demanding such high requirements. Can it be that Pharmacy is right and all the others are wrong? If it is necessary for the successful practice of Medicine, Commerce, Law, Engineering, etc. that the beginners have a broad general education, it is also necessary for the pursuit of Pharmacy. If the man who manages a farm finds that this preliminary education is necessary, how much more necessary is it for the man who follows a scientific profession or meets the fierce competition of the commercial world?

Some may argue that this particular education does not teach the student how to accumulate dollars and cents or how to create a desire for a commodity that he has to sell. This training develops the mind of the young student and teaches him correct habits of thought. In fact, many of our young people are unable to direct their thinking, while many others are prone to avoid mental exercises. This training, although it may not bear directly upon the work in hand, is of great value in mental development, and no one needs this mental development more than the pharmacist. He comes in contact with people in all walks of life, and ought to be able to meet these people upon an equal footing and discourse intelligently upon the topics of the day. In particular he ought to be able to speak intelligently concerning medicines and public health questions. If he does not have a good fundamental training, he will find himself handicapped in meeting this important obligation.

There is something necessary for the full development of the American citizen other than the ability to accumulate this world's goods. We are learning to-day, as we never did before, that a full rounded life gives as well as receives and, to be truly successful, we must render service to our neighbors as well as secure a competence for ourselves. If the war has taught us one thing it is this, that he who renders service to his fellow man and to the nation is more worthy of respect and honor than he who accumulates wealth. Not a little part of this service in a commonwealth like ours consists in activity in public welfare work, whereby the respect of the community is secured. Have the pharmacists of the country done their full measure along this line? Do they command the respect that an educated professional class should command? Do they take as active a part in public life as is expected of college men? To answer these questions I have but to state that we have endeavored for a year now to secure recognition in the Army, and have failed. What if somebody has the lid down and is sitting upon it! If we had sufficient public sentiment back of us, the lid would soon be lifted. The chemists of the country had no particular difficulty in securing recognition. The Sanitary Corps was organized especially to give recognition to bacteriologists, food chemists, sanitary and public health workers. Even nurses have received recognition, but we have failed. We failed because we lacked the necessary public sentiment to force recognition, and, I believe, that one of the

chief reasons why we lacked it, is because our profession ranks very low in educational attainment. When a man, whose only qualifications are that he has sold cigars, or "jerked" sodas for four years, can cram for a pharmacist's examination and pass it, and thus become a bona fide member of our profession, we cannot expect to command much respect, and we are not getting it.

Not until the retail pharmacists of the United States awake to the importance of higher entrance requirements for their profession and demand them, will we be able to place pharmaceutical education on a plane that will command the respect of our sister professions and of the public. As long as the retail pharmacists demand cheap registered men and lend their support to diploma factories that turn them out, just so long will pharmaceutical education be at a low ebb. The colleges themselves are unable to remedy the difficulty, because there are bound to be "black sheep" in the fold if there is financial gain in being black.

Turning now to the criticisms of which I have spoken. Doctor Beal, in "Facing the Facts," very ably presents the problems that confront us to-day. He discusses the whole question and shows us the reasons for the rise of "commercial pharmacy" and the decline of professional pharmacy. He asks, "Shall we like other small industrial proprietors, accept the transformation from producers to store-keepers and distributors, or shall we linger in a fool's paradise of hoping for some special dispensation of Providence to save us from the operation of economic laws that are universal in application?" He then proceeds to show us that "commercial pharmacy" is just as ethical as professional pharmacy, or at least can be made so.

Mr. H. B. Mason, commenting editorially upon the speech of Dr. Beal, says that this address should have been given before a group of pharmaceutical teachers and writers instead of before a group of retail pharmacists, as they have been "facing the facts." Continuing he says, "Too many of the college professors and too many of the writers and lecturers on pharmacy are still seeking, like Mrs. Partington, to sweep the ocean back with a broom. The college curriculum becomes more and more scientific. Little or no attention is paid to commercial subjects. The student is told that he must go out into the highways and byways and play the part of a pharmaceutical Moses and rescue the calling from the disgrace into which it has fallen."

In the July issue of the *Bulletin*, Mr. Mason says, "Only a half-hearted recognition of 'commercial pharmacy' has been made. Perhaps the most unfortunate feature of the solution lies in the fact that the colleges are not so blind as to what is going on as they are stubborn. They see the truth, but they refuse to recognize it."

Over and against such criticism we have that of the office of the Surgeon General of the Army in replying to the Attorney for the N. A. R. D. when he requested that students in pharmacy be furloughed to complete their college courses. This Office made it very clear that it considered a great majority of the colleges of pharmacy as colleges in name only, since their most important function was preparing mercantile clerks for retail pharmacies. There are only about eight real colleges of pharmacy in the United States, according to their expressed opinion, and the Surgeon General hesitates to recognize them because of the difficulty involved in denying recognition to the other so-called colleges.

At the recent meetings of the American Medical Association the Council refused to endorse the recognition of the pharmacists in the Army. When the members of the Council were asked why they refused to do this, they said that they could not afford to recognize as equals a class of men with as little professional education as the pharmacists have.

Again, the fact that we have not been able to convince the House Committee on Military Affairs of the necessity of recognition of pharmacists in the Army is good evidence that they consider our professional training insufficient.

Thus our colleges are attacked by one set of critics for not devoting more time to commercial and less to professional subjects, and by another set of critics for giving so much attention to commercial and so little attention to professional subjects.

I maintain that the colleges of pharmacy are giving the retail pharmacists what they demand. There are a goodly number of retail pharmacists that are demanding better and better professionally prepared graduates and our better colleges of pharmacy are meeting this demand. On the other hand, there are many retail pharmacists that demand a commercially trained man with a sufficient smattering of professionalism to get him by the State Board of Pharmacy, and we have a number of colleges that are supplying this demand.

Mr. Mason is wrong when he says that the colleges are stubborn. Those colleges that, in his opinion, are going to seed in professionalism, have a deep realization of the obligation, often a matter of life or death, that devolves upon pharmacists and they are willing to sacrifice numbers in order to protect the public from incompetence. When the dispensing of prescriptions is separated from commercialism and done entirely by men who love their work sufficiently to take pride in it and do it well, then we will have a reorganization of our colleges that will meet the needs of both sets of critics.

The trouble lies in the attempt of the retail pharmacists of the country to do two entirely different things well at the same time. This is impossible. Either they should devote themselves to commercialism or to professionalism. I have heard retail pharmacists say that they were not dispensing pharmacists and catered entirely to commercial trade. Yet the same men retain the sign "Prescription Pharmacists," and resent any imputation that they are not fully qualified for professional work. They refuse to remove their prescription laboratories, and turn over to their neighbors any professional work. The prescription sign and laboratory add a respectability to their business and they intend to retain it regardless of the fact that they are not devoting any time or interest to professional work.

A certain retail druggist has a card advertisement in every street car in his city, setting forth the care and precision used in compounding prescriptions in his place of business. I visited his store and expected to see a modern prescription laboratory. In this I was disappointed, for it was not what you would expect from the advertisement. When I remarked that he must do a good prescription business, I was surprised to have the proprietor tell me—with a sweep of his hand toward his well filled shelves—that he made his money out of paints, wall paper, patent medicines, drug sundries, etc., and that his prescription work amounted to nothing. Yet it was his prescription work that he was advertising. He was using it as a cat's paw to get people into his store so that he might sell them paints, wall paper, drug sundries, etc.

The cases that I have set forth are not unique and can be multiplied many times throughout the United States. Until the retail pharmacists stop using their professionalism only as a means to further their commercialism, we cannot expect to advance.

Many retail pharmacists demand cheap help and say that they are not able to pay the college prepared man, and are therefore in favor of keeping the requirements low that they may secure cheap help. One of the chief arguments against "prerequisite" legislation is that it will increase clerk hire. If these men are not able to pay competent help, why, under the sun, do they not give up their prescription work that is bringing them no profit and devote their entire attention to commercialism?

It is absolutely impossible to develop commercial and professional pharmacy together. We have tried to do it ever since American pharmacy began and have failed, as is evidenced by the criticism I have just set forth. Either one or the other or both will suffer if we continue to do it. They are incompatible, and we may as well "face the facts" and recognize the incompatibility and with true pharmaceutical skill remove it. As long as we continue to attempt to develop them together we will fail, because it is based upon the wrong assumption, that we can become proficient in two quite different things at the same time. The man who tried to kill two birds with one stone missed them both, and we have also missed both the full development of "professional pharmacy" and of "commercial pharmacy." European countries have recognized the absurdity of such an attempt and have solved the problem. Why not follow their example?

Let us then get back to a true premise and separate them and develop each without the encumbrance of the other—have colleges to train "commercial pharmacists," and also colleges to train "professional pharmacists." One class of education is just as ethical as the other. The old idea that to educate for merchandising is unethical is antiquated and out of date. We have changed our ideas a great deal regarding what is ethical and what is unethical, and the man who retains the old notion that "commercial pharmacy" is unethical should wake up and realize that we are living in an age that is wise enough to consider any useful occupation as ethical.

Let us have good colleges with high requirements that will give our boys a good broad education together with expert training in "commercial pharmacy," and also good colleges that will do the same for "professional pharmacy." When we do this, then and then only will we

reach a solution to our difficulties. "Professional pharmacy" has been a millstone around the neck of "commercial pharmacy" and vice versa long enough. Let us cut them free and permit them to develop, each to its full measure.

You may ask how this is to be done. I answer, "I do not know." I only know that it is necessary for the full development of each. The operation may be a little severe, but the patients will soon recover from it and once they get upon their feet they will produce marvelous developments.

May I suggest a plan by which this may eventually be accomplished without disturbing business conditions. All registered pharmacists of to-day will retain their registration and enjoy their full privileges, therefore we must begin with those who are entering. If all entering the calling be divided into two classes, say pharmacists and druggists, with different requirements and privileges for each of them, then the first step toward this end would be made, and eventually our aim would be accomplished. This could be done without disturbing business, or causing hardship to any one.

Require of druggists a pharmaceutical competence similar to that required of assistant pharmacists to-day or even that required of registered pharmacists, and in addition a thorough training in all commercial branches. Grant them the privilege of conducting a modern commercial drug store, but not the privilege of compounding prescriptions or handling the more dangerous poisons and narcotics.

Require of pharmacists at least a training equivalent to that required for a baccalaureate degree, including the usual cultural subjects of English, mathematics, modern languages, physics, history, economics, etc., and a thorough training in chemistry, pharmacy, materia medica, bacteriology, physiology, chemistry, and food and drug analysis.

Men with such a training would be competent to dispense medicines, handle narcotics, and other poisons, and do analytical work for the physician and public health boards. There is to-day a demand for men qualified for making urine, gastric, bile and feces analyses; bacteriological and physiological analysis; and the demand for such experts is growing instead of decreasing. A pharmacist prepared as suggested would be qualified to do all of this work. In addition the demand for laboratory analyses for the protection of public health is growing, and in some states they are advocating a public analyst for each county. Here is another opportunity for our pharmacists. Before very long the prescription business done by our present pharmacists would be turned over to them and this—together with the sale of sick-room supplies, surgical instruments, etc.—would make a very good competence for the pharmacists. They would be conducting a purely ethical pharmacy, in the present-day acceptance of the meaning of this term, and in addition a bacteriological, analytical, and physiological laboratory.

I think I hear you say that there would not be a sufficient amount of work to support even a limited number of such pharmacists. My own city alone, a city of 20,000, could support three or four such pharmacists if all prescription work were turned over to them. At present a man is employed all of his time in making urine, gastric, bile, bacteriological and physiological analyses, with an increasing demand for this kind of work. It may be that smaller communities could not support such an establishment at present, but time will adjust this difficulty and meanwhile the present registered pharmacists could handle the prescription business.

The colleges of pharmacy could easily adjust themselves to such a plan. Our present two-year courses, if extended and modified to suit the needs, could easily educate druggists, and our four-year courses the pharmacists. The graduates of our four-year courses are not entering the drug stores to-day, because clerk hire is so low, and other activities offer better opportunities. This is unfortunate, because pharmacy is losing its best prepared men. This would be changed with the newer opportunities that would present themselves in "professional pharmacy."

When we require of pharmacists a training similar to that which I have outlined, then the matter of recognition will take care of itself. In fact, their services would be demanded, conscripted if need be, and proper recognition in the form of commissions would be given to them.

American pharmacy is so unorganized that it is almost impossible to secure united action on any matters pertaining to the professional side of the calling, albeit we have preached organization for the last fifty years. Such is not true of other lines of work. We have excellent evidence of the power of organization in the strength wielded by the American Medical Asso-

ciation. In my own state about ten percent of the registered pharmacists are members of their state organization, while ninety percent of the ice men are members of their organization. It has been impossible to well organize the pharmacists of any of the states except those in which membership in the state organization is required by law. The mere handful of retail pharmacists that belong to the American Pharmaceutical Association is conclusive proof that the organization of pharmacists along professional lines is next to impossible.

Along the commercial lines the endeavor meets with much better success, and the N. A. R. D. has a very well perfected organization, that is producing results. One reason for this is because many retail pharmacists do not do a sufficient "professional" business to become interested in the scientific phase of their calling. The scientific sections of our State Associations receive scanty attention. I have seen retail pharmacists sit with a bored expression on their faces throughout an interesting paper on some phase of "professional pharmacy." They were not interested because they could not apply the ideas to their business.

Now if the separation that I have referred to were made, we would throw together men interested in the same things, the merchant pharmacists and the prescription and analytical pharmacists. As a result of common interest and common purpose these men would form a closer and more effective organization and another one of our problems would be solved.

The idea of the separation of "professional" and "commercial" pharmacy is not a new one, by any means, but one that has been thought about and discussed many times. Papers on this subject have been presented to this Section before. In "Facing the Facts" Dr. Beal says, "The results (that is a frank acceptance of commercial pharmacy), will be an acceleration of the present trend towards a division of the drug trade into prescription pharmacists and merchant pharmacists, each class rendering useful service and each having scope for development along the lines of their respective preferences."

I firmly believe that this separation is the only satisfactory solution of the problem and that the time is ripe for both parties to take the case to court and sue for a divorce. No organization is better fitted to judge the case than the American Pharmaceutical Association, therefore, in conclusion, I would suggest that this Section recommend to the Council that a Committee be appointed to study this question for a year and present to us at our next annual meeting a plan of separation that will cause the least amount of harm and the greatest amount of good to both of the unhappy parties.

C. B. JORDAN,

Chairman.

F. J. Wulling moved and F. E. Stewart seconded the motion, that the address be printed in an early issue of the JOURNAL and the recommendation of the address be referred to the Council. Carried.

Report of Secretary W. F. Rudd:

MR. CHAIRMAN AND MEMBERS OF THE SECTION ON EDUCATION AND LEGISLATION:

Before attempting to write this report your Secretary read again the one submitted in 1917 to this Section, by your present Chairman.

Those of you who were present on that occasion will recall that his report brought together in a most comprehensive way what the Colleges, State Legislatures and State Boards of Pharmacy were doing. I concluded that the report of this year should bring to the Section all changes in State Pharmacy Laws that have been made since the last annual meeting so as to keep the record up to date. In addition to this it seemed wise to collect and tabulate certain facts relative to State Board statistics. Accordingly, a questionnaire was sent to each State Board Secretary as follows:

- "1—What changes have been made in the Pharmacy law of your State since January 1, 1917?
- 2—What percent of applicants for examination in your State since January 1, 1917, have been graduates of Colleges of Pharmacy?
- 3—Number of applicants for examination for each of the following years:
April 1, 1914, to April 1, 1915
April 1, 1915, to April 1, 1916
April 1, 1916, to April 1, 1917
April 1, 1917, to April 1, 1918

4—Number of applicants granted registration for each of the following years:

April 1, 1914, to April 1, 1915

April 1, 1915, to April 1, 1916

April 1, 1916, to April 1, 1917

April 1, 1917, to April 1, 1918."

Question No. 2 relative to the percentage of applicants who were college graduates was suggested by Chairman Jordan. Questions 3 and 4 relative to number of applicants for examination and the number successful were suggested by the writer's own observation of results in Virginia. It has always seemed incongruous that often not more than one-third of those admitted as eligible for any formal examination, should be able to pass the same successfully.

The results for these States as tabulated below are striking. The writer cannot but feel that they furnish the basis for a strong indictment against the present system of admitting candidates to State Board examinations.

Replies have come in from thirty-one States and Question 2, as to percentage of applicants who are college graduates, has been answered as follows:

| | | | |
|---------------------|----------------------------------------|---------------------|----------------------|
| Alabama..... | 20% | Florida..... | 50% (about) |
| Arkansas..... | (Reports none) (evidently an error) | Conn..... | No figures available |
| Illinois..... | 39% | Indiana..... | 47% |
| Iowa..... | 20% | Kansas..... | 40% |
| Kentucky..... | 78% | Massachusetts..... | No statistics |
| Maine..... | 15% (about) | Maryland..... | 87% |
| Michigan..... | 10% | Minn..... | 12½% (about) |
| Missouri..... | 10.7% | Nebraska..... | 86% |
| New Hampshire..... | (No record) | New Jersey..... | (No record) |
| New Mexico..... | (No record) | New York..... | 100% |
| North Dakota..... | 100% | North Carolina..... | 19% |
| Ohio..... | 28% | Pennsylvania..... | 100% |
| Rhode Island..... | 80% | Tennessee..... | 50% (guess) |
| South Carolina..... | 68% | Texas..... | 49% |
| Vermont..... | 40% | West Virginia..... | 75% |
| Virginia..... | 35% | | |

The States with "prerequisite" law already in force report, of course, 100 percent. The States showing lowest percentage of graduates are: Maine, Michigan, Minnesota, and Missouri, all being below 20 percent. The State not having a "prerequisite" law, showing the highest percentage of graduates, is Maryland, with 87 percent. The general average for this report is 50 percent of graduates. That is to say, with States having "prerequisite" legislation only 50 percent of all men making application for examination in the States are graduates in pharmacy.

The thirty-one States returning questionnaire report on questions 3 and 4 are as follows:

| April 1914 to April 1918. | | | | | | | |
|---------------------------|-----------------|--------------------|--------------------------|-------------|-----------------|--------------------|--------------------------|
| States. | No. Applied. | No. Successful. | Per cent. Successful. | States. | No. Applied. | No. Successful. | Per cent. Successful. |
| Ala..... | 446 | 359 | 80.5 | N. J..... | 2315 | 688 | 29.8 |
| Ark..... | 487 | 216 | 44.3 | N. Mex..... | 34 | 24 | 70.6 |
| Conn..... | 330 | 110 | 33.3 | N. Y..... | 2592 | 1885 | 72.7 |
| Ill..... | 2355 | 758 | 32.2 | N. D..... | 125 | 71 | 56.8 |
| Ind..... | 1029 | 513 | 49.7 | N. C..... | 518 | 227 | 43.8 |
| Ia..... | 1065 | 514 | 48.2 | O..... | 2105 | 1029 | 48.8 |
| Mass..... | 2042 | 630 | 30.8 | Pa..... | 2437 | 1667 | 68.0 |
| Kan..... | 601 | 442 | 73.0 | R. I..... | 137 | 98 | 80.0 |
| Ky..... | 355 | 134 | 37.7 | S. Car..... | 263 | 153 | 58.0 |
| Me..... | 410 | 136 | 33.2 | Tenn..... | 337 | 142 | 42.1 |
| Md..... | 382 | 218 | 56.7 | Tex..... | 629 | 385 | 61.2 |
| Mich..... | 1340 | 672 | 50.2 | Vt..... | 128 | 45 | 36.0 |
| Minn..... | 1432 | 559 | 39.0 | Va..... | 672 | 307 | 45.0 |
| Mo..... | 529 | 310 | 58.5 | W. Va..... | 268 | 158 | 59.0 |
| Neb..... | 600 | 300 | 49.2 | | | | |
| N. H..... | 218 | 82 | 37.6 | | 26190 | 12832 | 48.9 |

Tabulating the preceding by years we get the following results:

| | Total No. Applied. | Total No. Passed. | Per cent. Passed. |
|-------------------------------|-----------------------|----------------------|----------------------|
| April 1914 to April 1915..... | 7088 | 3501 | 49.3 |
| April 1915 to April 1916..... | 7328 | 3493 | 47.9 |
| April 1916 to April 1917..... | 6961 | 3297 | 47.3 |
| April 1917 to April 1918..... | 5855 | 3267 | 55.8 |

These figures tell in unmistakable terms what most of us know from experience. In the past four years the number applying for examination has decreased from 7088 to 5855, or a difference of 1233. The number successful, however, was only 234 below the number registered four years ago. This seems to mean one of two things: either the material is better or the boards are more lenient. Maybe both conditions contributed to this end.

Repeating what was said in the first part of this report, it would seem that the percent of those successful in any set of examinations where proper precautions are taken in admitting candidates, should always be much above the average shown in the figures above. Why should candidates manifestly unfit be allowed to come up repeatedly without any additional preparation? Perhaps nothing has done as much to bring pharmacy examinations into disrepute as the fact that the same men continue to take these examinations year after year. This condition needs to be changed. This Section can at least go on record in favor of some method by which a limit may be set to the number of times a man may come up for examination.

Very few changes have been reported in the pharmacy laws of the thirty-one States returning questionnaires. Massachusetts has a new narcotic law; New Jersey a "prerequisite" law to take effect September 1920; Rhode Island reports changes in narcotic provisions; Virginia passed a "prerequisite" law which will go into effect in 1922.

And so the good work goes on. Each year adds one or two States to the list requiring graduation before registration. At the present time nine States are enrolled in this progressive list. May the time not be far distant when not one shall be left out.

Respectfully submitted,

WORTLEY F. RUDD,

Secretary.

W. H. Ziegler moved and Bernard Fantus seconded the motion to refer the report for publication. Carried.

The report of the Committee on Patents and Trade Marks was presented by Chairman F. E. Stewart. Motion of L. E. Sayre to receive the report was carried by vote of the Section.

A paper "What is the meaning of a degree in pharmacy" was read by the author, L. E. Sayre. (See August JOURNAL A. PH. A., p. 700.)

The next paper, entitled "The District of Columbia Advertising Law," was presented by L. F. Kebler.

After considerable discussion the following resolution was proposed by M. E. Dorsey:

"Resolved, That the Committee on Legislation, A. Ph. A., be instructed to take up with the War Board at Washington, D. C., the control of advertising pertaining to venereal diseases, and by coöperation with the Advertising Clubs of America, a national organization, endeavor to eliminate all advertising pertaining to venereal diseases from the daily and weekly press."

After some discussion a motion to adopt was carried.

The following papers were read and, after discussion, referred for publication:

"Publication of Potent Drug Content in All Ready-made Medicines," by Oscar Dowling.

"Pronunciation of Pharmaceutical Latin," by A. B. Stevens.

The report of the Committee on Regulation of the Transportation of Drugs by Mail was read and accepted.

A paper "What Shall We Teach" was presented by H. H. Rusby and after discussion referred for publication.

The first session of the Section on Education and Legislation was then adjourned.

SECOND SESSION.

The second session of the Section on Education and Legislation was convened at 9.30 A.M., Thursday, August 15, by Chairman C. B. Jordan.

The Committee on Nominations for officers for the ensuing year reported the names of nominees.

The following papers were read, discussed and referred for publication:

"Chemical Theory—A Practical Method of Teaching," by Freeman P. Stroup. (See October JOURNAL A. PH. A., p. 864.)

"Plan of Civil Administrative Code of Illinois in Its Relation to the Pharmacy Act," by F. W. Shepardson.

"The Teaching of Plant Chemistry," by Dr. Nellie Wakeman.

"Is Research Work Along Lines Suggested by the Last Revision U. S. P. Possible and Practicable in Schools of Pharmacy?" by C. S. Chase.

"Entrance Requirements to the Practice of Pharmacy," by W. G. Gregory. (See October JOURNAL A. PH. A., p. 870.)

"So-called Commercial Pharmacy Should not be Taught in Colleges of Pharmacy," by Frederick J. Wulling. (See October JOURNAL A. PH. A., p. 872.)

"The Future Pharmacists now in the Army and Navy," by H. F. Freericks. (The recommendations of this paper are printed in the minutes of the Sixth Session of the Council, November JOURNAL A. PH. A., pp. 1004 and 1005.)

A ballot was taken on the nominees for officers for the ensuing year; the result of the election to be announced at the Joint Session of this Section, the National Association of Boards of Pharmacy and American Conference of Pharmaceutical Faculties.

The second session of the Section on Education and Legislation was then adjourned.

JOINT SESSION OF SECTION ON EDUCATION AND LEGISLATION, A. PH. A., AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES AND NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

The joint session, as indicated above, was called to order by Chairman C. B. Jordan at 9.30 A.M., Friday, August 16.

The first order of business was the report of Secretary Theodore J. Bradley of the proceedings of the American Conference of Pharmaceutical Faculties. (See September JOURNAL A. PH. A., p. 799.) After some discussion the report was accepted.

Chairman F. E. Stewart read the report of the Committee on Patents and Trade Marks and also a paper entitled "Is the Exclusive Ownership and Use of Coined Names for Chemicals, Drugs and Their Preparations Objectionable and Should it be Subject to Limitation and Restriction?"

It was moved to accept the paper and report and refer them to the Publication Committee. Carried.

The result of the election of officers for the ensuing year was announced by Julius A. Koch, as follows:

Chairman—W. F. Rudd, of Virginia.

Secretary—C. A. Dye, of Ohio.

Associates—William Mansfield, of New York; E. L. Newcomb, of Minnesota; W. H. Ziegler, of South Carolina.

The report of the Fifteenth Annual Meeting of the National Association of Boards of Pharmacy was read by Secretary H. C. Christensen. (See September JOURNAL A. PH. A., p. 801.) After brief discussion the report was accepted.

Chairman Frank H. Freericks presented the report of the Committee on Model for Modern Laws Pertaining to Pharmacy. It was voted to continue the Committee and the report was referred for publication.

Chairman C. A. Dye presented the report of the Committee on Relations of Colleges with Boards of Pharmacy. It was referred to the American Conference of Pharmaceutical Faculties.

Chairman E. G. Eberle presented the report of the Fairchild Scholarship Committee.

REPORT OF THE CHAIRMAN OF FAIRCHILD SCHOLARSHIP COMMITTEE.

PHILADELPHIA, August 1, 1918.

As Chairman of the Fairchild Scholarship Committee my report has been made to the members of the Committee and also to Mr. Samuel W. Fairchild, so a report on last year's work simply requires me to speak of the results. Mr. Daniel Kollen, of New York, was the successful candidate, and his election met the approval of all members of the Committee and Mr. Fairchild as well. The next highest ranking candidate fell only 2.5 points behind, while the others were considerably lower.

The first American Fairchild scholar is of Russian birth, having been born in the city of Kishinef, State of Bessarabia, Russia, August 27, 1898. The father was a maker of wooden models for shoes; he died when Daniel was about eight years of age. The young man attended a Russian grammar school for about three and a half years and until April 1, 1910, when the family emigrated to the United States, arriving in New York City April 19. Two weeks after arrival Kollen entered Manhattan Public School No. 64, where June 29, 1913, the young man received his diploma. The spare hours and vacations were spent in the employ of his uncle at S. H. Ager's Pharmacy, 145 Avenue C, New York City, where he has ever since, up to the present, given his time between studies. September 9, 1913, Daniel entered DeWitt Clinton High School, New York City, from which he graduated June 30, 1917. His recommendations from the teachers and preceptor are excellent in every way.

All the papers concerned with the examinations are in my hands and I also have copies of all correspondence bearing on the subject. On February 15th I notified Mr. Fairchild of the election of Daniel Kollen, and at the same time advised him of the action of the Joint Conference as I understood it at the time, and enclosed the pages from the JOURNAL of January, 1918, 60-64. My letter follows:

February 15, 1918.

MR. SAMUEL W. FAIRCHILD,
WASHINGTON & LAIGHT STS.,
NEW YORK CITY.

DEAR MR. FAIRCHILD:—

I wrote you January 31 and was awaiting the return of the vote of the Fairchild Scholarship Committee and they have unanimously declared that Daniel Kollen, 600 E. 169th St., New York City, has won the Fairchild Scholarship which you so kindly donated. I do not

presume that any further action on our part is necessary and that you will take up the matter with the nominee. Of course, if you deem it necessary, I shall be glad to attend to the matter.

I take this opportunity also of bringing the matter of award for the next scholarship to your attention, and, if you decide to act in accord with the expression of the Section on Education and Legislation of the American Pharmaceutical Association, the American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy, it will be necessary for us to provide a different standard for the candidates and thereafter a different kind of examination. It would take up too much space in this letter and the action on my report will be found on the enclosed pages.

One argument for awarding the scholarship to a graduate is that there is more likelihood of giving it, not only to a deserving student, but, at the same time, to one who will apply himself for the benefit of pharmacy. The question came up of whether in awarding one scholarship it was not better to give it to one who had shown his aptness rather than one who had all the college years before him. I would be glad if you would advise me of your decision as early as you can.

The Fairchild Scholarship Committee for this year is composed of the following members: Dr. A. R. L. Dohme, Pratt & Howard Sts., Baltimore, of the American Pharmaceutical Association; Prof. Henry Kraemer, Univ. of Michigan, Ann Arbor, of the American Conference of Pharmaceutical Faculties; W. P. Porterfield, 61 Broadway, Fargo, N. D., of the National Association Boards of Pharmacy, and the Editor of the JOURNAL.

I have notified Mr. Daniel Kollen of his election.

With expression of sincere regard,

Respectfully,

(Sgd.) E. G. EBERLE."

In reply, Mr. Fairchild answered:

"NEW YORK, February 18, 1918.

MR. E. G. EBERLE, CHAIRMAN,
FAIRCHILD SCHOLARSHIP COMMITTEE,
PHILADELPHIA, PA.

DEAR MR. EBERLE:—

I notice with pleasure the article in the JOURNAL, page 60, recommendation No. 5. 'It is the sense of the Conference that Mr. Fairchild could render the greatest service to pharmacy by offering the scholarship to a graduate pharmacy student.' Now, Mr. Eberle, I shall be delighted to do so, and think perhaps it is the best thing we could do with the Scholarship, so you may change it around and do anything that you please.

When does Mr. Daniel Kollen begin his studies? Then we will know when to send him a cheque.

With kind regards and best wishes, I am

Yours very truly,

(Sgd.) SAM'L W. FAIRCHILD."

and my answer was as follows:—

"February 19, 1918.

MR. SAMUEL W. FAIRCHILD,
WASHINGTON & LAIGHT STS.,
NEW YORK CITY.

DEAR MR. FAIRCHILD:—

I have your splendid letter of February 18 and under the circumstances the Fairchild Scholarship Committee will undoubtedly be very much pleased to have your consent to offer your scholarship to a graduate pharmacy student. I am to-day sending out letters to that effect.

Relative to Mr. Daniel Kollen, he began his studies in Brooklyn College of Pharmacy last fall and is now a junior student there.

We are endeavoring to make haste with the next scholarship so that it can be offered for a graduate student for this year. This will then right the matter and there will be no further trouble in awarding the scholarship each year.

With expression of sincere regard,

Respectfully,

(Sgd.) E. G. EBERLE,

Chairman, Fairchild Scholarship Committee."

On February 19 I sent out the first letter, as a result of which the following were named as the Examination Committee: J. W. Sturmer, H. C. Christensen, Geo. C. Diekman, R. A. Lyman. A date, June 25, was named for Examination Day, but as it was impossible to reach a decision, notice of postponement was made and all pharmaceutical journals kindly printed the notice. There has been considerable correspondence and the decision was reached that final action would be taken during the meeting of the American Pharmaceutical Association in Chicago.

Respectfully,

E. G. EBERLE, *Chairman*.

Further report of the Committee on Award of the Fairchild Scholarship is printed in September JOURNAL A. PH. A., p. 824. Since then Chairman H. C. Christensen has advised that the name of no candidate has been presented this year for the Fairchild Scholarship.

Chairman R. A. Lyman presented the report of the Committee on Higher Educational Standards. After some discussion it was voted to refer the report to the American Conference of Pharmaceutical Faculties.

The paper presented at the close of the Second Session of the Section on Education and Legislation by Frank H. Freericks was discussed and, after approving of the recommendations therein, referred to the Council.

(As heretofore stated, the recommendations are printed in November JOURNAL A. PH. A., p. 1004. The Council has taken action and the Committee is now at work.)

The Joint Session of the Section of Education and Legislation, American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy was then adjourned.

WHAT SHALL WE TEACH?*

BY H. H. RUSBY.

The teacher who is thoroughly interested in the subject matter of the Syllabus cannot fail to be impressed by the objections that are advanced against the inclusion of matter that does not pertain to the particular department of instruction in which the objector is interested. It is a regular occurrence for such teachers to depreciate the value of and disparage attention to the subjects taught by others. Within the last few months the writer has been favored with the following views, partly verbal and partly written, from teachers whose schools are represented in the American Conference of Pharmaceutical Faculties.

1. "You make the subject of pharmacy entirely too prominent in the Syllabus. Pharmacists no longer manufacture their own preparations and they are getting farther away from it all the time. The pharmacist is becoming more and more a tradesman. What we want in the Syllabus is more attention to the commercial side of the business."

2. "Only the fundamental principles and procedures of business should be taught in the pharmacy school. The way to learn business methods is by business experience, and the place for it is the store, the same as in any other department of commerce."

3. "The pharmacy course is no place for so much botanical instruction as is contained in the Syllabus." "Boards of pharmacy do not ask questions upon it and should not do so." "Botany is a delightful study and I find great recreation in pursuing it in my spare time, but the pharmacist has no use for it and it should be deleted from the pharmacy course."

4. "An extreme amount of attention is given to pharmacognosy in your Syllabus. The retail pharmacist no longer sees crude drugs to any extent and is seeing less and less of them in any condition. Only a very few drugs should be studied and those only in a superficial way."

* Read before Section on Education and Legislation, A. Ph. A., Chicago meeting, 1918.

5. "Not one drug store in a hundred possesses a compound microscope and the average pharmacist will never look into one after leaving the school."

6. "There is no sense whatever in going so extensively into the subject of physiology. The retail pharmacist has no use for this knowledge and it is a waste of good time for the teacher to devote more than a few hours to it." This number of hours has been variously stated at from twenty-five to ten, this allowing for both lectures and recitations.

7. The study of the actions and the uses of drugs is said to be a complete work of supererogation. "If it has any permanent effect it is that of tending to encourage counter prescribing, which offends the physician and tends to widen the breach between physician and pharmacist."

8. One would suppose that the subject of chemistry in pharmacy teaching would be safe from the hands of the vandal, but this is very far from being true. We have been subjected to severe criticism for what is called "an attempt to make analytical chemists out of pharmacy clerks." Even pharmaceutical testing for purity of product has been roundly criticized, and that by successful, prominent and highly educated pharmacists, on the ground that "pharmacists very rarely test their drugs, and could not begin to do so if they desired, without employing a chemist for that special purpose." It is declared that this time should be devoted to teaching pharmacy proper.

The one subject that has been practically free from criticism is toxicology. There appears to be a unanimous agreement that knowledge of toxicology is a prime requisite, as a means of safety for the pharmacist and his clerks and customers. I ask particular attention to this fact as it has a special bearing on what follows.

In quoting the above views, I must not be understood as disparaging any one of them. There is truth and sound reasoning in all. On the other hand, there are considerations of a directly opposite nature, which have been wholly ignored by these critics and it is to be remembered that for each and every one of the subjects mentioned, there are claimants demanding that they should receive far more attention than is now given them. Regarding a number of them, there are claims that they respectively constitute the backbone of the pharmacy course, this word "backbone" having actually been employed in a number of arguments. Two facts are quite obvious: First, that they cannot all be backbones; second, that it is the usual thing for a specialist to think that his special subject is the backbone of the structure.

I can readily imagine the reflections with which different members of the audience have listened to the views quoted, and I think that I can single out most of those who entertain the respective opinions concerning them. In the case of each claim there are some who would like to cry out "Amen" in good old Methodist fashion, while others are curling the lip of contempt. The Syllabus maker can do neither. He is a referee and he must act as a judge. We should all be Syllabus makers. Even our most ardent specialists should place a curb upon their enthusiasm and endeavor to get the viewpoint of the other. Is it not time that we should systematize our work and formulate our methods of Syllabus revision? The only way to do this is to study the relations of each subject to each of the others and so treat it that it shall contribute the most possible to the value of the complete work. We must indeed go farther, and give some attention to the functions of the Syllabus course as the foundation for additional work in graduate and special courses. It is with this in mind that I submit for consideration certain facts upon which should be based definite principles and rules of action in Syllabus revision.

1. The pharmacy course of the present Syllabus is a very short and necessarily very incomplete course and must therefore be directed toward the accomplishment of a specific purpose, namely that of preparing ordinary clerks for pharmacy, prescription work being the main subject to be considered.

2. This course is not intended to prepare specialists in any part of the pharmaceutical field, and Syllabus makers should firmly resist any attempt by the teachers of specialties to pervert the Syllabus into an organ for turning out their music.

3. The relation of each subject to each other, as to explaining it and rendering its teaching most efficient in the production of a useful whole, should be more carefully studied than it is and should constitute the main guide in determining the extent to which that subject should be admitted into the course.

4. The course of the Syllabus is so highly inadequate, even for the one purpose that it has in view, that it must be assumed that all who enter the profession of pharmacy will go far beyond the Syllabus field, either in an additional school course, or through information subsequently gained, in one way or another.

5. For the reason just stated, the Syllabus must be regarded, in addition to the above characterization, as a preparation for the subsequent pursuit of specialties. This office of the Syllabus course cannot be too seriously considered, and Syllabus makers should proceed as carefully in fitting it for this service as for that of preparing for the pharmacy board examination.

Considering carefully all the inconsistencies, exaggerations and absurdities which abound so profusely in Syllabus criticism, it is clear that almost without exception they proceed from a failure to appreciate one or another of the principles which I have enunciated. The first requisite for Syllabus harmony is their recognition and observance.

It is because of this fact that I have insisted, as I still do, that the only way to make a good Syllabus is to begin our investigation at the top and to determine what kind of a foundation will be necessary for the superstructure. This is a very different process from that of beginning to build at the top, and it is the method that is employed in all architectural work.

Pursuing such a study based on the above principles, I have reached the following conclusions:

Considering the subject of toxicology as less subject to adverse criticism than others, let us see what preparatory instruction is necessary for its intelligent study. It involves a knowledge of what substances are poisonous and of the nature of their poisonous properties; also the relations between their medicinal actions and uses and possible poisoning by them. This necessarily involves some knowledge of diseased functions, which in turn involves a comparison between that and healthy functions. A study of healthy functions is physiology and no mere question and answer course in it will meet the above necessity. We can limit the field considerably but we must study that field quite closely and, above all, rationally. Physiology is called for in an additional direction. Every one now regards pharmacodynamics, miscalled "pharmacology" by many, as one of the important subjects of the advanced course. How is it possible for one to experiment on animals, as to the action of drugs, without a good knowledge of physiology, and of anatomy as well? I conclude that no reduction in the physiology of the present Syllabus can be made, unless medicinal action and toxicology are to be deleted, and that much more of it is necessary as a preparation for pharmacodynamics.

It appears equally obvious that the poisonous and medicinal constituents of drugs must be known from the chemical point of view before anything can be

done in studying their action. The organic chemistry of the Syllabus is at the very most no more than sufficient for this purpose. As to the inorganics, no argument seems called for to show that no portion of the inorganic chemistry of the Syllabus can be spared.

If this is true of chemistry as a basis for materia medica and toxicology study, what is to be said of it as a basis for pharmacy? Who can claim that any part of the chemistry now in the Syllabus is not essential as foundation for other work, without considering the subject of chemical analysis at all? Who can deny that another year should be allowed to permit of increased chemical instruction as a basis for advanced courses?

If our Syllabus chemistry is indispensable in preparing for materia medica, toxicology and pharmacy, what shall be said of our fragmentary and elementary physics course as a preparation for chemistry and pharmacognosy? Certainly, no portion of it can be spared!

To how great an extent is a knowledge of pharmacognosy necessary in the study of materia medica? None can deny that some crude and powdered drugs are regularly sold in our pharmacies, nor that others are used by practically all pharmacists in their own operations. A practical knowledge of such articles, and the ability to examine and test them by the use of both the simple and compound microscope, is a necessity of the most practical character. It is claimed that because such drugs form but a small portion of the complete lists of the Pharmacopoeia and Formulary, we should omit the study of the others from the Syllabus course; but consider for a moment what would be the opinion of the medical profession of a pharmacy course that did not include the study of all the articles that are included in the two books which constitute our legal standard. Imagine a profession ignorant of the very identity of the articles that are legally standardized as to both identity and purity! I would admit that many of the minor drugs might be but little studied, but I would never admit that any of them should be dismissed with no attention whatever.

What does the necessary preparation for the study of pharmacognosy include? Supposing that we studied thoroughly only twenty-five or fifty drugs; do they not contain all the vegetable tissues, and would they not include every portion of the plant? How then could any part of the structural and descriptive botany of the Syllabus, as to both outer and inner structure, be omitted, without crippling the student of pharmacognosy at a later period? The question as to whether boards of pharmacy ask questions has no relation whatever to the study of subjects fundamental to others on which they do ask questions. We never knew a board to ask questions in spelling, grammar or common arithmetic, but they assume that the candidate must know these subjects, and I think that any candidate found seriously deficient in them should be thrown out. It is the necessary and useful status of physics, physiology and botany as fundamentals that should control the decisions of Syllabus makers regarding their admission. The present botany of the Syllabus cannot be curtailed!

As to our pharmacy, it, if anything, should be regarded as the "backbone" of the Syllabus. Whether pharmacists actually make a preparation in their practical business or not, no man who does know how it is made should be regarded or licensed as a pharmacist. This is the department toward which all the others

herein considered are contributory, and we should have more rather than less of it.

It is my conviction, after most careful consideration of the subject, and investigations of all other views that could be obtained, that so long as our course remains of its present proportions, we cannot do better than to retain as compulsory all the subject matter now made so, and that we should include, properly indicated by brackets or otherwise, considerably more than is to be recommended for those schools in whose courses it can be incorporated; also, that the matter for a third year should be recommended as desirable and an effort made to lead up to the definite inclusion of such a third year's work.

In conclusion, I wish to say a few words regarding the duty of the Conference of Faculties of bringing to the attention of the high schools and of state authorities who pass judgment upon the work of such schools, the necessity of insisting more rigidly on better scholarship on the part of those who are graduated and promoted from one class to another. The habit of depending solely upon marks, good-naturedly and loosely allowed, results in supplying us with matriculants who must subsequently be taught by us the things which they are supposed to know before coming to us. Who has not had one, two and three year high school students, and even graduates, who are incompetent to perform or understand ordinary arithmetical problems, whose spelling and grammar are disgraceful and whose knowledge of Latin is limited to *Sic Semper Tyrannis* or *E. Pluribus Unum*?

In my opinion, the Conference of Faculties should investigate this subject and take suitable action.

DISCUSSIONS.

C. A. DYE: Doctor Rusby has made plain something that is fundamentally sound, something that I fear at some day may, if I am a good judge, interfere with the working of our prerequisite law. The question came up in Ohio when we were attempting to pass a prerequisite law, what could we adopt for a commercial course? We adopted the Pharmaceutical Syllabus of 1913, which includes some commercial work. Can the law make it compulsory so that a school must teach a certain amount of bookkeeping, a certain amount of advertising, and a certain amount of other business subjects? I am very much in favor of teaching commercial subjects, but I believe we ought to have in the Syllabus, as Dr. Rusby has said, a skeleton to build upon. Is the Pharmaceutical Syllabus compulsory for members of our Conference or does the Conference recommend it as a basis for pharmacy courses?

CHAIRMAN C. B. JORDAN: I understand it is to be used as a basis, that a certain number of hours be given by colleges to the subjects but they can go beyond these requirements. Dr. Rusby is a better authority.

H. H. RUSBY: You are right, but when the State Board adopts the Syllabus, as many boards have done, then it becomes compulsory.

CHAIRMAN C. B. JORDAN: I doubt very much if your State Board will insist that you teach exactly what is in the Syllabus.

C. A. DYE: They will demand that we teach the number of hours required by the Syllabus. When it comes to insisting on the number of hours on commercial subjects, I don't know what they may do. The Conference should adopt a standard for a pharmacy course and make it mandatory for its membership. That will give us something to work upon.

CHAIRMAN C. B. JORDAN: I take it that is what our Syllabus is as far as the number of hours is concerned.

C. A. DYE: That is mandatory, is it?

CHAIRMAN C. B. JORDAN: It is understood you will adopt the number of hours, but not necessarily the methods employed for teaching. Am I not right, Dr. Rusby?

H. H. RUSBY: That is perfectly right.

THE ADMINISTRATION OF PHARMACY PROBLEMS IN ILLINOIS.*

BY FRANCIS W. SHEPARDSON.¹

During the thirty-six years between 1881 and 1917, the enforcement of the Pharmacy Act in Illinois was in charge of the State Board of Pharmacy. On July 1, 1917, a new and somewhat revolutionary governmental plan became operative. The Pharmacy Board was abolished and all of its rights, powers and duties were vested in the Department of Registration and Education. This is one of the nine departments under what is known as "The Civil Administrative Code." Efficiency in the enforcement of the Pharmacy Act is, to a large degree, dependent upon powers granted by the code, and, as there has been some anxiety among leading representatives of Pharmacy in the country lest Illinois has taken a backward step, so far as the interests of the profession are concerned, it may not be out of place to consider for a short time this new, unusual and attractive administrative machinery for State government.

The present Constitution of the State of Illinois became operative in 1870. Although amendments have been made to it from time to time, its main provisions are substantially as they were first written. Nearly a half century, marked by astonishing changes, has elapsed. Illinois has become an imperial commonwealth. Its population has been trebled. Its problems have increased in complexity with the social, economic and industrial changes. The governmental result was the creation in Illinois from time to time of many special boards and commissions. These were designed primarily to relieve overburdened constitutional officers from tasks which it was physically impossible for them to perform. In practical experience these boards and commissions, eventually more than one hundred and thirty in number, tended to become semi-independent administrative factors in government, each with its own headquarters, officers and equipment. Almost inevitably conflicts of jurisdiction resulted and with them, naturally, much duplication of effort and expenditure.

This condition was recognized by many as undesirable. During a period of ten years there was agitation and discussion of the necessity for a change. An Efficiency and Economy Commission was appointed to provide a more perfect system of accounting and to combine and centralize duties. It was hoped that this study would lead to the rejection of much useless machinery and to a reorganization of the State government on modern business lines. The committee selected a trained political scientist as director, took the advice of a large number of officials and other citizens, held many hearings at which testimony was presented from almost every possible point of view. As a result of the investigations, there was published a report of 1,050 pages, everywhere recognized as one of the most remarkable documents in the history of State government in this country. But there was not much effort to make the work count toward definite reforms until the gubernatorial campaign of 1916. This made the occasion for placing the code project before the people for general consideration and discussion. Colonel Frank O. Lowden made its championship one of the prominent planks in his platform. Immediately after the people had chosen him to the high position of Gover-

* Read before Section on Education and Legislation, A. Ph. A., Chicago meeting, 1918.

¹ Director of Registration and Education.

nor, he took active measures to make the idea a reality. He had long believed in the possibility of conducting the affairs of a State on business principles. In his inaugural address he emphasized the importance of the administrative reform. He secured the coöperation of many members of the Legislature. He devoted long hours of study to the problem. Largely because of his earnest, personal advocacy, the Civil Administrative Code became law.

Its salient feature is the combination of the various governmental agencies. Nine departments are created, those of Finance, Agriculture, Labor, Mines and Minerals, Public Works and Buildings, Public Welfare, Public Health, Trade and Commerce, and of Registration and Education. For each of these departments there is an executive officer, called a Director, who is required to devote his entire time to the State work, this being an important new feature. He is provided with such subordinate assistants as are deemed necessary, the number varying in the different departments.

The Code has now been in operation for nearly fourteen months. Experience has amply justified those who so strongly urged the administrative reform. The new machinery has worked far more smoothly than its most sanguine supporters had hoped. It has won new friends steadily. Naturally there have been some difficulties. The period of operation is as yet too short to warrant final judgment. Deficits from previous years had to be paid from the receipts of this year, and imperative expenditures for long-needed repairs and improvements had to be met. The extraordinary conditions of the past year of war, such as the rise in the cost of commodities, the exceptional coal bills due to the severe winter, and the increase in postage and in railroad rates, made havoc of plans for retrenchment. In spite of all obstacles, however, the financial reports of the first year showed gratifying economies and substantial savings, along with greatly increased efficiency. All who are actively associated with Governor Lowden in the administration are confident that the Code will commend itself to the people of Illinois more and more, if its splendid features are given a chance for a fair trial under more normal conditions.

The Department of Finance is the keystone of the structure. Its work is certain to show substantial results. Its officers are giving the most painstaking scrutiny to all outlays, and many kinds of waste heretofore ignored are being effectively checked. They are studying the expenditures of every part of the State government with the purpose of preparing a detailed budget under which, for the first time, the State's business may be conducted in a systematic manner and with the same economy and fidelity demanded in all successful private or corporate undertakings.

It ought to be said that the centralization of administration under the Code is not complete because outside of its jurisdiction are the Civil Service Commission, a few remaining boards and the so-called constitutional offices, such as those of the Secretary of State, the Auditor of Public Accounts, the State Treasurer, the Superintendent of Public Instruction and the Regents of the State University. Should the campaign for the much-needed new constitution, adapted to the requirements of a great State such as Illinois has grown to be since 1870, be successful, one outcome of a constitutional convention might well be the inclusion of the duties of all these officers under similar proper departments. In actual practice,

however, there has been complete harmony between the Constitutional officers and the Code ones, so that the entire governmental machinery at Springfield has been working smoothly in the direction of exceptional administrative achievement.

Limitations of time do not permit further consideration of the Code in its entirety. It is a remarkable State document. It represents a notable advance in political science. The plan of organization of each department is extremely interesting. The distribution of powers among the departments, the internal workings of the departments and the great number and variety of the problems requiring administrative solution are alike attractive. A widespread interest in the Code has been awakened. Many letters of inquiry about it have been received. Several other States are giving serious consideration to the adoption of a similar plan of government. Anyone who cares to study the thirty-seven page booklet containing this epoch-marking legislative act will be well repaid.

The special concern of this association is in the administration of the Pharmacy Act of Illinois. In the reorganization scheme the licensure of pharmacists was placed in the Department of Registration and Education. Something about this Department, therefore, may be of interest to you.

While the double name, Registration and Education, seems to imply divided activity, a closer survey of the powers and duties of the Department shows that the thought of education is the dominant one. The word "Registration" relates to the administrative work associated with all of those professions and trades from whose members the State requires a license. The Department has jurisdiction over about a dozen different lines of endeavor, including those of the architects, barbers, chiropodists, dentists, embalmers, horseshoers, midwives, nurses, pharmacists, physicians, plumbers, structural engineers, and veterinarians. In its main office in Springfield, it has a staff of twenty-five persons, whose work is being so organized as to distribute responsibility most effectively and to secure accuracy, efficiency and promptness in administration. It maintains a Chicago office in the rooms formerly occupied by the Pharmacy Board.

The oversight of the licensing features of the activities of the Department is placed in the hands of an official called the Superintendent of Registration. He is charged with the arrangements for the necessary examinations as provided for in the Statutes, with the furnishing of adequate assistance for the examinations, with the notification of the successful candidates, with the keeping of the records and files of certification, and with the large amount of correspondence relating to licensure in the several lines. Inasmuch as all the laws which regulate licensure provide for the evaluation of credentials both of preliminary education and of professional training, the Division of Registration has among its duties the collection of the essential preliminary information about applicants and the investigation of their qualifications for examinations.

So, naturally, the Department must concern itself with the establishment of standards and the approval of both the schools themselves and of their courses of instruction. If the authority given by the Code and by the several practice acts should be invoked to its full degree, the power of the Department over schools of all grades and types would prove to be very great.

The word "Education" in the Department's title, therefore, does not imply

an entire change of thought from that of "Registration." It may, however, be taken to refer to certain types of higher education, which are carried on under State auspices, and which are professional, investigational, or strictly scientific in their nature. The five normal schools which, before, were controlled by separate boards of trustees, are now placed under the jurisdiction of the Department, with a single board of which the Director of Registration and Education is chairman. Grouped under the Department, also, are the three scientific surveys, located at Urbana, in connection with the State University, namely, the State Geological Survey, the State Water Survey, and the State Natural History Survey. For the study of the needs of these surveys and the development of their work, a special advisory board of scientists, called "The Board of Natural Resources and Conservation" and representing the different fields of research touched by the surveys, has been provided, the Director of the Department being its chairman. The Department has jurisdiction also over the State Museum, located at Springfield. For advice regarding its management there is a board composed of specialists representing the five different lines of activity with which the museum concerns itself, namely, botany, ethnology, zoölogy, manufacture, and museum administration.

In the selection of the members of these advisory and executive boards, the desire was to secure individuals of the highest character entirely regardless of political affiliation, whose names would carry weight whenever mentioned. The responses to invitations to serve the State in these non-salaried positions were most gratifying, many men of national reputation as specialists gladly lending their aid. The Department has been greatly strengthened in its administration by its ability to command the assistance and advice of men of such preëminence. The magnitude of its educational work, if expressed in terms of appropriations, which for the biennium exceed \$1,962,000, is such as to make it fairly comparable with similar special departments in a great American university.

The controlling idea behind the Civil Administrative Code has been stated to be combination and coördination with localization of authority under responsible individuals. There is no doubt that the personnel of the directorate is a most important element in the successful working out of the plan. If the Code lent itself to the machinery of political organization, and the selection of officers were made purely for partisan reasons, special fitness for a given task being made entirely subordinate, there might reasonably be fear for the result. The scope of the activities of the several departments, however, is so broad as not only to require the full-time service of individuals of recognized responsibility and position, but also to present to them for solution problems demanding the highest talent, and worthy of a strong man's best endeavor.

The Code specifically provides that the Director of Registration and Education, the Assistant Director, and the Superintendent of Registration shall not be affiliated with any college or school of medicine, pharmacy, dentistry, nursing, optometry, embalming, barbering, veterinary medicine and surgery, architecture or structural engineering, either as a teacher, officer or stockholder, nor shall they hold license or certificate to exercise or practice any of the professions, trades or occupations regulated.

This provision has caused some confusion, where the complete story of admin-

istration has not been told. It has been reported, for instance, that some pharmacists have thought that Illinois had taken the licensing of members of their profession out of the hands of those properly qualified by training to be the judges. A little reflection makes the reason for the restriction apparent. Absolute impartiality and exact justice are more likely to be secured where personal interest or possible professional jealousy is absent. In the working out of the Code plan there has been marked a notable change of attitude toward the law on the part of violators, whether intentional offenders or chance ones. The prospect of being prosecuted by a great Department of a State Government, the executive officers of which are not members of the profession involved, and whose main interest in the case is that of the enforcement of the law of the State, appears to be much more feared than was the danger of trouble with members of a board connected with the same profession. This has had many illustrations since last July. There is no doubt that every practice act of Illinois has become far more effective than it ever has been, because it now has behind it the machinery, the resources and the administrative power of a State Department. The interests of pharmacy in Illinois never were so well protected as they are under the Department of Registration and Education, even though the long-familiar term "State Board" has been thrown into the discard.

Another restriction of the Code provides that, whenever the several laws regulating professions, trades and occupations which are devolved upon the Department for administration, so require, certain enumerated functions and duties shall be exercised. These relate to standards of admission, curricula of schools and colleges, rules and regulations of examinations, conduct of examinations, the granting and revoking of licenses. It is definitely declared that, where the law of a profession, trade or occupation so requires, none of these enumerated functions and duties shall be exercised by the Department except upon the action and report in writing of persons designated from time to time by the Director to take such action and to make such report.

This restriction is a safeguard against personal inefficiency, arbitrariness, or corruption on the part of the Director. It also is designed to indicate clearly the pervading idea of the Code that, while the administrative duties of former State Boards have passed under the control of a department, the strictly professional features are properly safeguarded.

The Code provides for the pharmacists a committee of five persons, each of whom shall be a competent registered pharmacist in the State, and shall have had ten years' practical experience in the dispensing of physicians' prescriptions since such registration. The members of this committee, as of all similar ones in the Department, are appointed "from time to time." These words are important. There is no exact term of service for a member of an examining committee. The advantage of the limitation has already been shown in a number of cases, where trial revealed the fact that the individual selected for one profession or another was not well chosen. The objection to this plan is made, that there may be lack of continuity of policy from the professional point of view where there is uncertainty of tenure of committee members. This is obviated by the possibility of reappointment of those whose worth has been proved in actual experience. The danger in the personal appointment feature is the danger attending the entire

Code plan. An individual honored with selection as director of a department, or, for that matter, given any important task to perform anywhere, either will, or will not, rise to his responsibilities.

Another objection is urged that the word "Committee" does not carry with it as much honor as the word "Board," and is not understood in other States. The answer to this has already been given in the declaration that the interests of Pharmacy in Illinois never were so well protected as now and that other States, on becoming advised of the facts, will learn to honor the members of the committees chosen from the profession for the aid of the Department. And here it may be stated that a third safeguard of the Code declares that in making the designation of persons to act for the several professions, trades and occupations, the Director shall give due consideration to recommendations by members of the respective professions, trades and occupations, and by organizations therein.

Working under these general limitations, the Department has been successful in establishing friendly relationships with the best interests of every one of the professions and trades coming under its jurisdiction. In the selection of the first committees to work under the new plan, great care was taken. The Department officers desired a certain degree of continuity between the proceedings of the new Department and those of the old State Boards. They had an ambition to secure as advisers, groups of men whose names would command respect throughout the State, and who, in themselves, would be an assurance to all that under no circumstances could there be retrogression under the changed conditions of the Code. The practice acts have been enforced strictly. The examinations have been above suspicion. The committee members have worked faithfully and promptly, and generous commendations have come from many influential citizens who have expressed their opinion that the laws in which they have been specially interested have been interpreted and enforced in a highly satisfactory manner.

Several questions have been considered by the Department during the year which have general interest to the profession of pharmacy. One relates to the situation which confronts the drug trade owing to the effect of the draft. In many parts of the State it was practically impossible to find properly equipped individuals to serve as registered pharmacists or assistant pharmacists. As a result, proprietors oftentimes found themselves placed in embarrassing situations where they were not able to conform to that part of the State law which requires that the stores shall be at all times in charge of a competent registered pharmacist. After much thought and after conference with representative men of the retail drug business, the Department prepared a list of articles which, during certain specified hours of the day, might be sold by apprentices. This list was printed in attractive form and given wide circulation throughout the State. Great care was taken to safeguard the interests of the public by express prohibitions, the privileges extended not including the right to compound or fill physicians' prescriptions. The action of the Department was received with grateful appreciation by the trade, whose leading members agreed to aid in the prosecution of any individuals detected in attempting to take advantage of the special war-time emergency arrangement.

Another matter which was considered to some extent was the propriety of

the annual registration fee. In an address delivered before the Illinois State Pharmaceutical Association this subject was discussed as follows:

It has been brought to the attention of the Department that some members of the profession have questioned the value of the annual registration fee. Whoever takes that position surely is uninformed regarding the usefulness of this bit of administrative machinery. Through it the Department is enabled to keep in touch with legal practitioners. It has proved a great aid in keeping a correct list of addresses. The requirement of reporting once a year the location of each registered man is extremely important. The plan furnishes funds for the Department at slight cost to the individual pharmacist. The Department has no funds at all except those voted to it by the Legislature in return for fees received from the different professions, trades and occupations licensed. An attack upon the registration fee becomes an attack upon the pharmacy law. Surely the interests of the pharmacists naturally should lie in the direction of the maintenance of a proper force to keep the pharmacy law respected. Furthermore the willing payment of such a small fee provides a splendid argument against the imposition of a larger annual State license fee, quite easily possible in these days of regulation when governments everywhere are seeking for increased opportunities for raising needed funds. It makes a splendid protection for the pharmacist against such taxes to be able to say that for years he has been accustomed to the payment of such a registration fee in order to maintain the provisions of the pharmacy law. Incidentally it may be said here that the pharmacy registration fee has been the model upon which members of other professions and trades have based laws for the regulation of their own interests. The close connection maintained by the Department with legal practitioners through the contribution of these fees has enabled it, as its predecessor the State Board of Pharmacy was enabled, to enforce the pharmacy law against the illegal and unworthy.

The object of the law is to insure that the innocent public may not be imposed upon by unscrupulous people in the matter of drugs, medicines and poisons; that every drug store in the State shall be under the supervision of a duly qualified pharmacist; that none but competent, reliable and trained men shall be permitted to sell dangerous poisons and compound physicians' prescriptions; that proper labels are affixed to containers of deadly poisons; that substitution and adulteration are not permitted and that the standard of the profession is elevated. It is a measure not only to protect the lives and health of the people, but to protect the legitimate pharmacist in his profession. Were it not for the restraining influence of the pharmacy law, every pharmacist in the State would be at the complete mercy of unscrupulous competitors, seeking to impose upon the people in the matter of the sale of drugs, medicine and poisons. This would be a lowering of the high standard of the profession to the level of a strictly commercial basis, without regard to efficiency or knowledge of the science of drugs, medicines and poisons. Should the pharmacy law be stricken from the statute books of Illinois, it would not be long until there would be twice as many so-called pharmacies in the State as there are at the present time. No more effective weapon could be used against the law than the withdrawal of the registration fees which have furnished, and which must still furnish, the money by whose aid the law is enforced.

A suggestion has been made in some quarters, and it is left with you for discussion, that in addition to the registration fee of the pharmacists or assistant pharmacists, all drug stores themselves should be registered. The advantages of this proposition are clear. Such a regulation would tend to limit the competition of general merchants in many lines which ought to be restricted to drug stores. If a law provided that no stores for the sale of drugs could be opened in Illinois without a certificate from the Department of Registration and Education, there might be opportunity for important restrictions. For example, it might be possible to limit the number of drug stores within a given radius or, better yet, to provide that the total number of drug stores in a community should bear a definite proportion to the total population. It may be an open question whether the closing up of a good many drug stores and the employment of their pharmacists in other stores might not on the whole be a desirable thing for the profession. This undoubtedly would be true in many communities where the normal trade

has been so divided up as to make it difficult for an individual to prosper; whereas with one store where now there are two, both men interested might reap better financial returns.

One other problem in pharmacy has presented itself. The Department has been making careful studies of professional education. It has been advancing standards wherever it has had the power to do so. It has raised the preliminary requirement for admission to a school of pharmacy recognized by it to two years of high school work. It has done this much under the authority granted to it in two paragraphs of the Code. One of these empowers it to prescribe rules and regulations defining, for the respective professions, trades and occupations, what shall constitute a school, college or university, or department of a university, or other institutions, reputable and in good standing, and to determine the reputation and good standing of a school, college or university, or department of a university, or other institution, reputable and in good standing by reference to a compliance with such rules and regulations. Another authorizes it to establish a standard of preliminary education deemed requisite to admission to a school, college or university, and to require satisfactory proof of the enforcement of such standard by schools, colleges and universities.

But its officers, as laymen, have not found anything to make them particularly proud of the professional requirements in pharmacy. It is an open question whether people generally or the officers of pharmacy schools really think of pharmacy as a profession, so notably has the purely commercial element entered into the situation. The chances are that if a hundred individuals were asked whether they ever thought of a pharmacist as a professional man, or the drug store as the home of a professional man, their answers would be in the negative. If they were asked to describe a drug store, they would undoubtedly tell of a soda fountain, a cigar stand, a candy counter, and a place where brushes of various kinds, face lotions or soaps might be secured, a sort of department store on the corner with a big electrical sign. If the professional side were mentioned at all, in all likelihood it would have to be after further questioning. When the pharmacist, in such a situation, hurries quickly to state that it is necessary for him to run this type of a store in order to make a living, he only increases the doubt which arises as to whether, after all, he is a professional man or is merely a tradesman.

So when the question of the establishment of a Pharmacy Reserve Corps in the United States Army is considered, any inquiry runs almost immediately upon the obvious fact that the requirements to enter pharmacy in this country are not such as would warrant the business to be placed for a moment by the side of medicine or dentistry. When the report of the hearing before the Congressional Committee on Military Affairs is examined, it is discovered that one of the arguments advanced for this Pharmacy Corps is that other countries have a similar arrangement. But when the detailed statements of the requirements for pharmacy in those other countries are examined, it is at once apparent that there is no basis of comparison whatever between the thorough-going preparation required there and the slipshod methods pursued in the United States. Ninety out of a hundred of the same individuals above mentioned, if questioned about the qualifications for a pharmacist, would indicate a pleasant disposition, a cheerful greeting of customers and a good-natured tolerance of all sorts of neighborhood imposition, as

the important factors, utterly forgetful of the professional side: Has the man had the foundation principles in the shape of high school training; has he had the wider outlook furnished by a college course or part of it; has he had systematic and thorough instruction in a professional school of pharmacy? The answers are in the negative, and in the popular mind such qualifications are entirely unnecessary for pharmacy in America.

As has been said, the situation is worse when abundant evidence is available that officers and teachers in pharmacy schools, in many cases, lack the educational qualifications needed and have slight interest in advancing the standards of their profession.

The Department recognizes this situation and understands that in the minds of most of those concerned, the pharmacist is a tradesman and not a professional man, that the commercial element, both in school and in store, far exceeds the educational one in importance, and that any advance step which the Department may desire to take in pharmacy, along with forward movements in other professions, must be limited by the low standards which prevail so far as preliminary education, equipment of teachers and educational ideals of the institution are concerned. At the same time it will be glad to coöperate heartily in any step for the betterment of the situation and for aiding the development of a real profession of pharmacy and for the reclaiming of what ought to be a noble guild with high ideals from its present commercialized surroundings.

DISCUSSION.

In response to questions propounded Mr. F. W. Shepardson said:

The department has an appropriation for inspection. Two of the present inspectors were employed in that capacity under the old State Board of Pharmacy. The Attorney General of the State is prosecutor. The law requires that the administration officers shall not be connected with any of the trades or professions regulated by this enactment. Among the trades and professions concerned, and the members of which pay registration fees, are pharmacists, dentists, engineers, architects, barbers, horse-shoers. A campaign is now being made among medical men to secure their endorsement of the registration feature for physicians, and there is every reason to believe that the plan will be endorsed by them.

F. H. FREERICKS: Dr. Shepardson refers to the effort to establish a pharmaceutical corps in the Army, and gives as one of the reasons for failing in that that the pharmacists cannot lay claim to education to meet the educational requirements; that his standing is that of a merchant and not that of a professional man. I do not believe that the statement should go altogether unchallenged because, in my opinion, it places somewhat of a wrong construction upon the entire situation. Medicine to-day has that much-desired recognition in the Army, and we must take the man in medicine as he is, and by way of comparison we must take the pharmacist as he is to-day. I venture to say that when you take the fifty thousand pharmacists of this country and set them up against the hundred and fifty to two hundred thousand medical men in this country, you will find proportionately as many educated men in pharmacy as you do in medicine. I think it is unfair to say that pharmacy should not be recognized for the reason assigned. I do not believe it is right that there should go out of this organization and with the approval of this Association an expression on our own part that we are not as well qualified for our work, that the pharmacists as a whole in this country are not as deserving of the recognition sought, as are the medical men for the recognition they have deservedly gained.

R. A. LYMAN: I fear the words of Mr. Freericks are apt to stir up feeling between medical men and pharmacists: we ought to have this because medical men have such and such. We ought to forget that; it is entirely immaterial. Dr. Shepardson hit the nail on the head when he said that teachers in pharmacy in the colleges of America have a very low ideal of the practice of pharmacy as a profession. I think there is where the real trouble is. I have always main-

tained in our meetings, as you know, that the schools of America and its educators set the pace for what the public think about us, and we have to look to pharmaceutical educators to elevate the ideals or ideas that the layman has of pharmacy as a profession. I think that Dr. Shepardson is exactly right when he places the blame upon pharmaceutical educators, and I for one, representing at least a certain type of educators of America, thank him for his courage in coming here and making that statement before us. He is a man from the outside and that expression of opinion from Illinois will do the pharmaceutical educators of America a whole lot of good, and indirectly be responsible for improving our professional standing.

F. J. WULLING: Dr. Lyman's statement that "pharmaceutical educators are responsible for conditions" should be modified somewhat. If he would say a faction of pharmaceutical educators are to blame I would agree entirely. There is another faction of pharmaceutical educators who feel that they have been working toward these higher aims and ideals against great odds, and they have accomplished something in the face of those odds. There are schools and practicing pharmacists at the present day who are equal to the best schools in medicine and practitioners of medicine.

I arose to say this particularly: That we are all thinking along the same lines, and those are upward lines. President Kraemer, of the Faculties, has made a recommendation which is exactly in line with this. Others made similar recommendations last year and three or four years ago, namely, that the present condition in pharmacy be recognized, that there are reputable and well-trained pharmacists, educated men who can meet representatives of other callings. The situation has been recognized in the recommendation for two classes of pharmacists or two classes of drug stores—one the pharmacist practitioner and the other a drug store—and that the colleges also arrange themselves accordingly. Possibly there would be no objection to the same college having two courses; I don't know. The fact is, we are working practically along the same line with the idea suggested by Dr. Shepardson.

Another thing: Many years ago a large number of pharmacists said that unless we pharmacists as a whole, the body pharmaceutical, puts its house in order, somebody else will do it for us. Here we have an instance of somebody stepping in who is not a pharmacist. I am not passing judgment upon the commission; many things Dr. Shepardson said I heartily agree with; in fact, he has endorsed my sentiments in many respects. This is only one instance of an outside agent coming in to regulate pharmacists and to say what they are to do and enforce what they are to do. We have let that slip away from us.

BOLSHEVISM IN PHARMACY.*

BY CHARLES H. LAWALL.

Words and phrases have associated concepts which may differ so greatly in different individuals that when these individuals enter into a discussion they are often talking about things which are diametrically opposed. "Pharmaceutical education," "pharmaceutical practice" and "pharmaceutical progress" are examples of phrases, often the subject of controversy in which there is no common ground of understanding. Indeed it is often true that these concepts are changed in the individual under the influence of time and environment. No definition of a liberal education has ever been given which surpasses the following, by Huxley, which is quoted to show how comprehensive and detailed a definition sometimes becomes.

"That man, I think, has had a liberal education who has been so trained in youth that his body is the ready servant of his will, and does with ease and pleasure all the work that, as a mechanism, it is capable of; whose intellect is a clear, cold, logic engine, with all its parts of equal strength, and in smooth working order; ready like a steam engine to be turned on any kind of work, and spin the gossamers

* Read at the November meeting of the Philadelphia Branch of the A. Ph. A.

as well as forge the anchors of the mind; whose mind is stored with a knowledge of the great and fundamental truths of nature and of the laws of her operations; one, who, no stunted ascetic, is full of life and fire, but whose passions are trained to come to heel by a vigorous will, the servant of a tender conscience; who has learned to love all beauty, whether of nature or of art, to hate all vileness, and to respect others as himself."

When we come to the question of pharmaceutical education or any other kind of scientific or professional education, however, we are dealing with a more restricted and specialized field. Without attempting to inflict upon you an arbitrary definition of this kind of education, I will state that I believe *that man is best educated who is most useful to his community and to his profession or trade*, whatever it may be. For further explanation of my personal views on some of these questions, I will take the unusual liberty of referring you to two previous articles in which I have expressed them. One is the address of the chairman of the Section on Education and Legislation of the A. Ph. A., published in the Proceedings of 1910, page 605. The other is an article entitled "When Is an Education not an Education?" JOUR. A. PH. A., 1915, p. 176. The views expressed on fundamentals in these two articles have not materially changed during the passage of time, but conditions have recently arisen which seem to call for further expression of opinion on certain phases of the situation.

There seems to be at present a peculiar tendency to throw discredit on commercialism of any kind in connection with pharmacy. The reason for this is seen every time one looks into the windows or sees the advertisements of a certain type of drug store, but why the large number of high-minded, ethical pharmacists, who are practicing their profession with the respect and support of leading members of the medical profession in their communities, should on that account be held up to scorn, is hard to understand.

We are led to believe that because Mr. X. or Mr. Y. makes a larger proportion of his gross profits from the sale of merchandise other than drugs, pharmacy is going to the dogs. Why should any stigma attach to a man because he is a good merchandiser? This double responsibility of such an individual to the community has been well expressed by Dr. Jacob Diner, as follows:

"On one side we must have the professionally trained man; on the other we must prepare the same man to be commercially able to avail himself of every honest, legitimate means for the financial advancement of his business."

The attempt to classify pharmacists according to professional attainments has been recurrent for centuries past. One of the first recorded legal enactments affecting pharmacy was that of Frederick II, of Sicily, in 1233 A. D. This law mentions "*apotheca*" in the sense of warehouses where drugs were stored; compounders of medicines were called "*confectionarii*," and sellers of simple medicines were called "*stationarii*." As throwing light on the subject of "side-lines," the following will be found of interest:

In the 16th century the Guild of Nuremburg druggists presented a memorial of grievances in which, among others, are the following complaints:

1. The sale of all confections has now fallen into the hands of the sugar dealer.

2. Counter sales (of spices) are now made by all of the large spice and cheap corner grocery shops, thus robbing the druggist of a source of profit that he is justly entitled to.

3. The sale of sundries, such as sealing wax, fumigating pastilles, paper, ink and pens is now taking place in common huckster shops.

4. The sugar dealers are not only selling confections but also all kinds of fruit juices and all such preserves as do not deteriorate in the course of a year.

These same Nuremburg pharmacists stated that "many of our brethren have matriculated at universities, some have attended academies, and others have even graduated as doctors. We consider that our profession is not a trade but is in reality a free art."

In the 18th century the pharmacists were held in derision for their claim to professional recognition, by Professor Hoffmann, one of the early professors of the University of Halle, who stated their scope of knowledge in the following way:

"The apothecary should know that an acid and an alkali, when brought into contact, will effervesce. It will suffice if he but know the effect although he may be ignorant of the cause."

Business or commercial ability is fundamentally responsible for success in any profession or for the continued existence of educational institutions, even those engaged in the most academic and intellectual lines of work. All rivalry or competition is in reality commercial rivalry or competition, and whether this is carried on fairly or unfairly depends upon the underlying principles of honesty, fair dealing and ethics possessed by the participants.

What are the primary objects of a college education in pharmacy? Is it to produce mental contortionists and star performers who can assimilate syllabi and transform the pabulum into passing marks for registration examinations, or is it to produce worthy, helpful members of the community? If we decide that the latter is preferable, the means must be studied and methods applied which will tend to produce the desired results. I say "tend to," for no idealistic attainment of results will ever be possible. We must work toward a desired end, whether we at first reach it or not.

We must discourage empiricism in scientific work and encourage an interest in and thoroughness of training in principles. Efficiency, success, service, are all factors of value and importance. We must encourage and teach the student to become accurate in his work and in his habits of thought, and if our work is conscientious and thorough, and the student is receptive and interested, we shall have contributed to the community an individual who will be a credit to his work and to his college and who will be a safe and ethical dispenser of extemporaneous medicines, whether they constitute five or fifty percent of his gross sales.

A certain number of the members of any group of young men and women have a natural aptitude and a greater liking for scientific work than for general drug store work. These should be given the necessary post-graduate instruction to enable them to become the neighborhood analysts and bacteriologists, to act as clinical advisers to the physicians of their communities, and should be trained to be helpful even along the broader lines of sanitation and hygiene, so as to give

aid to local health officers when needed. The preliminary education required for the best results should be a minimum of four years of high school work. This requirement should be enacted into the State laws, as has recently been done in the State of Illinois.

Any college of pharmacy with the proper equipment and instructional staff should be able to, and should have the right to teach both of such classes of pharmacists in such numbers as present themselves with properly accredited entrance credentials. That pharmacy is gradually separating into two distinct classes no one will deny. That it has been predicted for years, everybody knows. That it can be brought about over night by resolution, agreement or law, is impossible. Such views savor of Bolshevism, a specious, plausible, irresponsible type of propaganda which has been worrying statesmen for several years, but has not previously appeared in educational discussions.

To accomplish these changes needs more than the fiat of any individual or group of individuals. We cannot effect reform by resolution any more than we can decide scientific questions by a majority vote. Diplomas, degrees and certificates are but "scraps of paper" unless upheld by legislative enactment. Reformers frequently forget that laws are primarily for the protection of the public and not for the development of theories which are impossible to put into practice.

It is in the matter of legislation that we find our greatest stumbling block to rapid progress. Our "pre-requisite" legislation is too recent and not widespread enough as yet, to make such radical changes as would be necessary to effect an immediate sharp separation between drug merchandisers and professional pharmacists, desirable as it may seem in some extreme instances. Economic factors would be ignored, State laws would need to be changed, boards of pharmacy would have to cast aside the traditions and practices of a generation. Doctor Beal has truly said, "Compromise is the price of progress," and with this thought in mind, we should take pains to see that legal restrictions and educational qualifications should be coördinated and drawn closer together, not forced apart.

Looking back, therefore, at the whole subject, it is clear to my mind that any educational institution should be proud of the opportunity of training both pharmacists and druggists, if by druggists is meant the large number of self-sacrificing individuals who, during the recent influenza epidemic, closed everything but their prescription departments so as to devote their entire attention to the pharmaceutical needs of the communities in which they practiced.

The object of an education is that a man may learn to benefit himself by serving others, one who exemplifies the words applied by our own Dean Remington to a noble deceased pharmacist:

"A man whose soul is pure and strong,
Whose sword is bright and keen;
Who knows the splendor of the fight
And what its issues mean."

PERCENTAGE SOLUTIONS AND ALLIGATION.*

BY H. L. THOMPSON.

There is no one subject which receives such a great amount of discussion as the prescriptions calling for such and such a percent of this or that, and how to go about filling them when one has certain materials on hand.

It would be a very simple matter, if the specifications after percent, $\%$, were written w/w, w/v, or v/v as the case may be. There seems to be little understanding upon these matters, between the physicians who prescribe, and the pharmacists who fill and dispense such prescriptions.

$\%$ w/w, percent weight to weight, percent absolute, is a percentage based entirely on the weight of the finished product.

$\%$ w/v, percent weight to volume or percentage concentration, is a percentage by weight based on the volume of the finished product.

$\%$ v/v, percent volume to volume, is based as a percent by volume on the volume of the finished product.

In all three cases, the percentage solutions are approximately alike for weak percentage solutions, and if water solutions, but not exactly so. This discrepancy is still more pronounced in stronger percentage solutions, especially saturated solutions, and when solvents other than water are used.

For example, consider in the metric system the following problem of a 5% solution of KI, potassium iodide, in water, syrup and alcohol, 5% w/w, 5% w/v, and their possibilities. And for a liquid 5% v/v.

PERCENT, ABSOLUTE.—PERCENT, BY WEIGHT. W/W.

This method is the most accurate, and in the use of the metric system is very simple. It represents Gm. of substance in 100 Gm. of finished product, or parts per 100.

A 5% w/w solution would contain 5 Gm. of substance in 100 Gm. of solution. A 10% solution would contain 10 Gm. in 100 Gm.

There are four ways of making these, two making up to 100, and two having 100 Gm. of solvent.

Thus consider a 5% solution of KI.

| | | | |
|-----------------|-----------------|---------|-----------------|
| To make it take | 5 Gm. of KI | or take | 5 Gm. of KI |
| add | 95 Gm. of water | add | 95 mls of water |

| | | | |
|-------|---------------------|-------|---------------------|
| total | 100 Gm. of solution | total | 100 Gm. of solution |
|-------|---------------------|-------|---------------------|

If the specific gravity of the solvent is heavier than water, as syrup, sp. gr. 1.313,

| | | | |
|------|-----------------|---------|---------------------|
| take | 5 Gm. of KI | or take | 5 Gm. of KI |
| add | 95 Gm. of syrup | add | —72.35 mls of syrup |

| | | | |
|-------|---------------------|-------|---------------------|
| total | 100 Gm. of solution | total | 100 Gm. of solution |
|-------|---------------------|-------|---------------------|

95 Gm. \div 1.313 = 72.35 mls of syrup.

If the specific gravity is lighter than water, as alcohol, sp. gr. 0.816,

| | | | |
|------|-------------------|---------|----------------------|
| take | 5 Gm. of KI | or take | 5 Gm. of KI |
| add | 95 Gm. of alcohol | add | 116.4 mls of alcohol |

| | | | |
|-------|---------------------|-------|---------------------|
| total | 100 Gm. of solution | total | 100 Gm. of solution |
|-------|---------------------|-------|---------------------|

95 Gm. \div 0.816 = 116.4 mls of alcohol.

In all these cases the volumes are not 100 mls but vary inversely as the specific gravity of the solvent. With the water solution it is practically about 100 mls, with the syrup about 75 mls, and with the alcohol about 120 mls.

* Contributed to Section on Practical Pharmacy and Dispensing, A. Ph. A., Chicago meeting, 1918.

If one takes 100 mls or 100 Gm. of water and desires to make a 5% sol. by addition of KI, proceed as follows:

$$\begin{aligned} 100\% - 5\% &= 95\% = 100 \text{ Gm. of water} \\ 1\% &= 1.053 + 95 = 1.053 \\ 100\% &= 105.3 \text{ Gm. of solution} \\ 5\% &= 105.3 - 100 = 5.3 \text{ Gm. of KI} \end{aligned}$$

Therefore add 5.3 Gm. of KI to 100 Gm. of water to make a 5% solution.

If syrup, to 100 Gm. add 5.3 Gm. of KI,

or use $100 \div 0.313 = 76.15$ mls of syrup, and add 5.3 Gm. of KI,

If alcohol, to 100 Gm. add 5.3 Gm. of KI,

or use $100 \div 0.816 = 122.6$ mls of alcohol and add 5.3 Gm. of KI.

In case 100 mls of syrup are used and a 5% w/w solution is desired, $100 \times 1.313 = 131.3$ Gm. of syrup.

$$\begin{aligned} 100\% - 5\% &= 95\% = 131.3 \text{ Gm. of syrup} \\ 1\% &= 131.3 \div 95 = 1.382 \\ 100\% &= 138.2 \text{ Gm. of soln.} \\ 5\% &= 138.2 - 131.3 = 6.9 \text{ Gm. of KI to be added.} \end{aligned}$$

Therefore add 6.9 Gm. KI to 100 mls of syrup to make it 5% w/w.

In case 100 mls of alcohol are used and a 5% w/w solution is desired, $100 \times 0.816 = 81.6$ Gm. of alcohol.

$$\begin{aligned} 100\% - 5\% &= 95\% = 81.6 \text{ Gm. of alcohol} \\ 1\% &= 81.6 \div 95 = 0.859 \\ 100\% &= 85.9 \text{ Gm. of soln.} \\ 5\% &= 85.9 - 81.6 = 4.3 \text{ Gm. of KI to be added.} \end{aligned}$$

Therefore add 4.3 Gm. of KI to 100 mls of alcohol to make it 5% w/w.

In all the above cases we have the absolute percentage, parts in grammes per 100 grammes, everything based on weight, even if the solvents are measured.

If the other systems of weights or measures are used, I prefer to change them to the metric equivalents, and then go back, for more accurate and scientific work is done in the metric system than any other system, as I will attempt to show later. In practice, I usually use the metric system exclusively.

PERCENTAGE CONCENTRATION. PERCENT WEIGHT TO VOLUME. % w/v.

By this method is understood to mean Gm. per 100 mls making solutions up to 100 mls. Let us likewise consider the 5% w/v KI solution.

Proceed as follows: if water is the solvent,

take 5 Gm. of KI
add water enough to make 100 mls.

If syrup, sp. gr. 1.313, disregard the sp. gr.,

take 5 Gm. of KI
add syrup enough to make 100 mls.

If alcohol, sp. gr. 0.816, likewise disregard the sp. gr.,

take 5 Gm. of KI
add alcohol enough to make 100 mls.

This method of making percentage solutions is preferred by physicians and pharmacists because of the teaspoonful doses, solids being weighed and liquids measured.

Unless the specific gravity of the finished product of the different percentage solutions and the solvents is known, it is impossible to base percentage concentration % w/v upon a given 100 mls of solvent and the desired substance to it.

The above three cases do not take into account the specific gravity of the solvent; only that sufficient diluent is added to the weighed substance to make it up to 100 mls.

VOLUME PERCENTAGE. PERCENT BY VOLUME. % v/v.

By this is meant mils per 100 mils of solution.

To make a 5% v/v spirit of chloroform, take 5 mils of chloroform and add 95 mils of alcohol.

To make a 10% spirit of a volatile oil, from 100 mils of solvent,

$$100\% - 10\% = 90\% = 100 \text{ mils of alcohol}$$

$$100\% = 100 \div 0.90 = 111.1$$

$$111.1 - 100 = 11.1 \text{ mils of volatile oil to be used.}$$

This method is usually used by physicians and pharmacists, when all liquids are measured, regardless of their specific gravity.

In the above discussion the mil of water is practically considered as weighing 1 Gm., and the rule mils \times sp. gr. = Gm. is usually considered the best for temperatures from 15° C. to 25° C.

Again, I repeat, that where real precise and accurate work is desired use the metric system, and make percentage solutions weight to weight.

From the study of the above problems, it is apparent how complicated it must be to use other systems as the apothecary fluidounce, and avoirdupois weights, when making up percentage solutions, because of another discrepancy in the understanding as to whether 1 fluidounce of water is to be taken as weighing 456.3, 455.7, 454.6 at 4° C., 15° C., or 25° C. Practically, they say no harm is done, yet is the solution really accurate?

It has been my experience to fill prescriptions for several physicians where percentage solutions were to be based on weight, but the majority of the physicians desire the percentage solutions to be based by weight to volume for solids, and volume to volume for liquids. One physician stated that when I filled a prescription of his calling for a 4% solution of silver nitrate that each fluidounce should contain 20 grains of silver nitrate, basing his calculations on the fluidounce as equal to 500 minims.

The old adage "a pint is a pint the world around" should be forgotten. Too many pharmacists and physicians confuse ounce apothecary and fluidounce apothecary, and then complicate it still more by adding the % sign, when they desire percentage solutions.

I have had the peculiar experience of seeing a pharmacist when filling a prescription calling for 1 fluidounce of a saturated solution of potassium iodide base it on the weight of an ounce, saying one fluidounce weighs 437.5 grains, and then using the avoirdupois drachm of 27.34 grains as drachms of 60 grains.

Thus 1 part of KI is soluble in 0.7 part of water and equals 1.7 parts of solution. Then 1.7 parts = 437.5, 1 part = $1/1.7$ of 437.5 = 257.4 grains. $257.4 \div 60 = 4.289$, or 4.3 drachms. Then in filling the prescription calling for the one ounce of saturated solution of KI use 4 drachms avoirdupois and 10 grains (total 130 grains) and add water to make one fluidounce, and actually dispensing it as a saturated solution. If a pharmacist performs such a blunder as above, whether ignorantly or on purpose, it is no wonder that physicians, surgeons, dentists, and even veterinarians, desiring to get results from the medicines they prescribe, lose faith in the profession of pharmacy, and estimate it of little or no value, and really doubt our accuracy in the art of dispensing, when the same is performed by the pharmacists that do know.

Is there no remedy for this? Can not physicians, dentists, veterinarians, and pharmacists come to a better understanding and adopt a certain method of writing and filling percentage prescriptions?

As a suggestion to a possible solution of this problem, the percent absolute, $\frac{\text{Gm.}}{\text{Cc.}}$ w/w, is the most accurate one, and will cover all desired cases of amounts. It is used exclusively in Continental Europe.

But in Great Britain and the United States solids are preferred to be weighed and liquids measured. Therefore, would it not be a good plan to adopt the system required and ordered in the departments of Army and Navy, Marine Hospital Service, and Public Health, that in their work to use the metric system exclusively, expressing solids in grammes and liquids in cubic centimeters. If this rule of weighing solids and measuring liquids in the metric system exclusively were adopted, then we could say that any percentage solution called for would mean $\frac{\text{Gm.}}{\text{Cc.}}$ w/v in the case of solids, and $\frac{\text{Gm.}}{\text{Cc.}}$ v/v in the case of liquids, the solids being weighed, the liquids being measured, and the whole made up to the desired finished volume.

And lastly, this method would easily give the dose per teaspoonful, which is really of great importance to the physician.

Thus, 120 Cc. of a 7.5% solution of ammonium chloride, NH_4Cl , in syrup would contain $120 \times 0.075 = 9.0$ Gm. of NH_4Cl , and enough syrup added to make 120 Cc. or mls. One teaspoonful = 4 Cc., then $120 \div 4 = 30$ teaspoonfuls. $9 \div 30 = 0.3$ Gm. of NH_4Cl , the dose per teaspoonful.

A CORRECTION TO BE APPLIED TO PERCENTAGE SOLUTIONS.

In the problems, the solids and the liquids were assumed to be 100% pure. If they are not the use of alligation simplifies the process. However, the problems can be solved by percentage and ratio and proportion.

If volumes contract it is preferable to weigh the substances.

Rule. Divide the amount figured on the 100% pure basis by the real percentage expressed in its decimal fraction and use this amount of substance. Then make up to the required number of Gm. or mls, as the case may be for $\frac{\text{Gm.}}{\text{Cc.}}$ w/w, $\frac{\text{Gm.}}{\text{Cc.}}$ w/v, or $\frac{\text{Gm.}}{\text{Cc.}}$ v/v.

Or apply Alligation, Rule III (which see).

Thus, how much 95% sulphuric acid will be necessary to make 100 Gm. of 10% acid?

$$10\% \text{ of } 100 \text{ Gm.} = 10 \text{ Gm.}$$

$$10 \text{ Gm.} \div 0.95 = 10.53 \text{ Gm. of } \text{H}_2\text{SO}_4$$

$$100 - 10.53 = 89.47 \text{ Gm. of water if } 10\% \text{ w/w,}$$

or make up to 100 mls if 10% w/v is desired.

$$95 \text{ } 10 \text{ } x \text{ or } 10 \text{ } 52$$

$$19 : 2 :: 100 : x \quad x = 10.52$$

or 10

$$\begin{array}{r} 0.85 \text{ } y \text{ or } 89.49 \\ \hline \end{array}$$

$$19 : 17 :: 100 : y \quad y = 89.49$$

$$\begin{array}{r} 95 \text{ } z \quad \quad 100 \\ \hline \end{array}$$

If a stated amount of diluent is given, proceed likewise. Thus how much liquefied phenol 87% must be added to 500 mls of water to make a 5% solution?

$$500 \times 0.95 = 526.3 \text{ mls of finished product}$$

$$526.3 \times 0.05 = 26.315 \text{ mls of liquefied phenol}$$

$$526.3 - 26.32 = 499.98 \text{ or } 500 \text{ mls}$$

$$87 \text{ } 5 \text{ } x \quad 26.3$$

$$82 : 5 :: 500 : x \quad x = 26.3$$

or 5

$$\begin{array}{r} 0.82 \text{ } y \quad 500.0 \\ \hline \end{array}$$

$$\begin{array}{r} 87 \text{ } z \quad 526.3 \\ \hline \end{array}$$

See alligation.

Under corrections to be applied to percentage solutions, mention was made of mixtures of different percentages. The six following rules of alligation will cover all such cases, whether solids or liquids, provided percentages are based on absolute percent, by weight.

Alligation is the short cut of the rule of three or ratio and proportion. In counter distinction to objections, raised, if those mixtures, solids or liquids are mixed by weight, the best and most reliable method, the allegation is very simple and exact.

ALLIGATION MEDIAL.

RULE I.—Given various amounts (two or more) of ingredients with their corresponding values; to find the value of the result when these are mixed, proceed as follows:

1. Multiply the amount of each ingredient by its value;
2. Add the values of these products;
3. Add the amounts of ingredients, or parts;
4. Divide the sum of the products by the sum of the amounts of the ingredients or the sum of the parts, as the case may be.
5. The quotient is the value of the mixture.

NOTE.—This rule is always used to prove Rules II, III, IV, V, and VI.

Example I:

Given 20 Gm. of 80%_v, 20 Gm. of 36%_v, 480 Gm. of 6%_v acetic acids. What will be the value of the mixture of these acids?

$$\begin{array}{r}
 80 \times 20 = 1600 \\
 36 \times 20 = 720 \\
 6 \times 480 = 2880 \\
 \hline
 520 \quad) \quad 5200(10 \\
 \underline{5200} \\
 \hline
 \end{array}$$

ALLIGATION ALTERNATE. USED IN ALL THE REMAINING RULES.

RULE II.—Given the values of two ingredients; to find the parts to be used of each ingredient, one of which is higher and the other of which is lower than the desired intermediate value, proceed as follows:

1. Draw a vertical line.
 (e) To the left of this line, place the value desired;
 (b) To the right of it, the values of the ingredients;
2. The value of the stronger ingredient minus the desired value equals parts to be used of the weaker ingredient.
3. The desired value minus the value of the weaker ingredient equals parts to be used of the stronger ingredient.
4. Total the parts.
5. Simplify the parts, and the total, so that the ratio and proportion can be easily applied.
6. Prove results by Rule I.

Example II:

In what proportions may 95%_v and 20%_v sulphuric acids be mixed to make 50%_v sulphuric acid?

$$\begin{array}{r}
 95 \quad 39 \quad \text{or} \quad 6 \quad \text{or} \quad 2 \quad . \quad \text{Proof} \quad 95 \times 2 = 190 \\
 50 \quad \bullet \quad 20 \quad 45 \quad \text{or} \quad 9 \quad \text{or} \quad 3 \quad \quad \quad 20 \times 3 = 60 \\
 \hline \quad \quad \quad 75 \quad 15 \quad \quad \quad 5 \quad \quad \quad 5 \quad) \quad 250 \quad (50
 \end{array}$$

RULE III.—To find the amounts of stronger, weaker or total, when one of these is given, when the desired intermediate value is given, and the values of the stronger and the weaker ingredients are known, proceed as follows:

1. Apply Rule II.
2. Opposite parts, place x, y, z.

x = parts of stronger ingredient.

y = parts of weaker ingredient.

z = total parts in mixture.

3. Place the known amount opposite its proper value, and part in place of x , y , or z , as the case may be.

4. Then find the other unknowns by ratio and proportion.

5. Prove by Rule I.

Example IIIa:

Given 200 Gm. of 30% HCl. How much water must be used to make it 10%, and what is the total amount of the finished product?

$$\begin{array}{rcllcl} 30 & 10 & 1 & x & = & 200 \\ 10 & & & & & \end{array}$$

$$\begin{array}{rcllcl} 0 & 20 & 2 & y & = & 400 \\ \hline & 30 & 3 & z & = & 600 \end{array}$$

$$\text{Proof: } 30 \times 200 = 6000$$

$$\begin{array}{rcllcl} 0 & \times & 400 & = & 0 \\ \hline & & 600 &) & 6000 & (10 \\ & & & & 6000 & \\ \hline & & & & & \end{array}$$

$$1 : 2 :: 200 : y \text{ or } y = 400.$$

Therefore to 200 Gm. of 30% add 400 Gm. of water to make 600 Gm. 10%.

Example IIIb:

Given 500 Gm. of water. How much sulphuric acid 75% must be added to it to make 25%, and what is the weight of the finished product?

$$\begin{array}{rcllcl} 75 & 25 & 1 & x & = & 250 \\ 25 & & & & & \end{array}$$

$$\begin{array}{rcllcl} 0 & 50 & 2 & y & = & 500 \\ \hline & 75 & 3 & z & = & 750 \end{array}$$

$$\text{Proof: } 75 \times 250 = 18750$$

$$\begin{array}{rcllcl} 0 & \times & 500 & = & 0 \\ \hline & & 750 &) & 18750 & (25 \\ & & & & 1500 & \\ \hline & & & & 3750 & \\ & & & & 3750 & \\ \hline & & & & & \end{array}$$

$$2 : 1 :: 500 : x \text{ or } x = 250.$$

Therefore, to 500 Gm. of water add 250 Gm. of 75% acid to make 10% acid, and the finished product weighs 750 Gm.

Example IIIc:

In what proportions must 28% ammonia water and water be mixed to make 560 Gm. of 10% ammonia water?

$$\begin{array}{rcllcl} 28 & 10 & 5 & x & = & 200 \\ 10 & & & & & \end{array}$$

$$\begin{array}{rcllcl} 0 & 18 & 9 & y & = & 360 \\ \hline & 28 & 14 & z & = & 560 \end{array}$$

$$\text{Proof: } 28 \times 200 = 5600$$

$$\begin{array}{rcllcl} 0 & \times & 360 & = & 0 \\ \hline & & 560 &) & 5600 & (10 \\ & & & & 5600 & \\ \hline & & & & & \end{array}$$

$$14 : 5 :: 560 : x \text{ or } x = 200.$$

$$z - x = y, \text{ or } y = 360.$$

Therefore, 200 Gm. of ammonia water 28% and 360 Gm. of water must be mixed together to make 560 Gm. of 10% ammonia water.

RULE IV.—Given the desired total amount of ingredients and its value, and the amount of one ingredient and its value, to find the amount of the other ingredient and its value to produce the above total amount and its value, proceed as follows:

1. Multiply the desired total amount by its value;

2. Multiply the amount of the ingredient given by its value;

3. The product of the total amount by its value minus the product of the amount of the given ingredient by its value, equals the product of the amount of the other ingredient and its value.

4. The total amount minus the amount given equals the amount of other ingredient needed.

5. The product of the other ingredient and its value divided by the amount of other ingredient needed equals the needed value of the other ingredient.

6. Prove by Rule I.

Example IV:

How many grammes of belladonna and of what value, must be added to 50 Gm. of 1.2% belladonna to make 500 Gm. of 0.3% belladonna?

$$0.3 \times 500 = 150.0$$

$$1.2 \times 50 = 60.0$$

$$\begin{array}{r} \text{x} \quad) \quad 450 = 90.0 \end{array}$$

$$\text{Proof: } 1.2 \times 50 = 60.0$$

$$0.2 \times 450 = 90.0$$

$$\begin{array}{r} 500 \quad) \quad 150.0 \quad (0.3 \\ \underline{150.0} \end{array}$$

$$x = 90.0 \div 450 = 0.2\%$$

Therefore, 90 Gm. of 0.2% belladonna must be added.

RULE V.—Extension of Rule II, where there are more than two ingredients.

1. (a) If an even number of values, pair off the values, one higher with one lower than the desired value.

(b) If an odd number of values, link one value with two others, the stronger with two weaker, or one weaker with two stronger, as the case may be.

2. Place opposite each value, the difference between the value to which it is linked and the desired value, always keeping the values of the parts positive.

3. Total the parts.

4. Simplify the parts.

5. Prove by Rule I.

Example Va:

In what proportions may 6.5%, 5.0%, 3.0% and 2.5% cinchonas be mixed to make 3.5% cinchona?

$$6.5 \quad 0.5 \quad 1$$

$$5.0 \quad 1.0 \quad 2$$

3.5

$$3.0 \quad 3.0 \quad 6$$

$$2.5 \quad 1.5 \quad 3$$

$$\begin{array}{r} \underline{6.0} \quad \underline{12} \end{array}$$

$$\text{Proof: } 6.5 \times 1 = 6.5$$

$$5.0 \times 2 = 10.0$$

$$3.0 \times 6 = 18.0$$

$$2.5 \times 3 = 7.5$$

$$12 \quad) \quad 42.0 \quad (3.5$$

or

$$6.5 \quad 1.0 \quad 2 \quad 13.0$$

$$5.0 \quad 0.5 \quad 1 \quad 5.0$$

3.5

$$1.5 \quad 3 \quad 9.0$$

$$3.0 \quad 3.0 \quad 6 \quad 15.0$$

$$2.5 \quad 6.0 \quad 12 \quad)42.0(3.5$$

Example Vb:

How may 35, 25, 20, 10 and 5% substances be mixed to make 15%?

(I).

$$\begin{array}{r} 35 \quad 5 \quad 1 \quad 35 \\ 25 \quad 5 \quad 1 \quad 25 \\ 15 \quad 20 \quad 10 \quad 2 \quad 40 \\ 10 \quad 20-10 \quad 6 \quad 60 \\ 5 \quad 5 \quad 1 \quad 5 \\ \hline 55 \quad 11 \quad)165(15 \end{array}$$

(III).

$$\begin{array}{r} 35 \quad 10 \quad 2 \quad 70 \\ 25 \quad 5 \quad 1 \quad 25 \\ 15 \quad 20 \quad 5 \quad 1 \quad 20 \\ 10 \quad 10-5 \quad 3 \quad 30 \\ 5 \quad 20 \quad 4 \quad 20 \\ \hline 55 \quad 11 \quad)165(15 \end{array}$$

(II).

$$\begin{array}{r} 35 \quad 5 \quad 1 \quad 35 \\ 25 \quad 10 \quad 2 \quad 50 \\ 15 \quad 20 \quad 5 \quad 1 \quad 20 \\ 10 \quad 20-5 \quad 5 \quad 50 \\ 5 \quad 10 \quad 2 \quad 10 \\ \hline 55 \quad 11 \quad)165(15 \end{array}$$

(IV).

$$\begin{array}{r} 35 \quad 10 \quad 2 \quad 70 \\ 25 \quad 10 \quad 2 \quad 50 \\ 15 \quad 20 \quad 5 \quad 1 \quad 20 \\ 10 \quad 5 \quad 1 \quad 10 \\ 5 \quad 20-10 \quad 6 \quad 30 \\ \hline 60 \quad 12 \quad)180(15 \end{array}$$

| (V). | | | |
|-------|------|----------|----|
| 35 | 10 | 2 | 70 |
| 25 | 5 | 1 | 25 |
| 15 | 20 | 10 | 40 |
| 10 | 10 | 2 | 20 |
| 5 | 20-5 | 5 | 25 |
| <hr/> | | <hr/> | |
| 60 | 12 |) 180(15 | |

| (VI). | | | |
|-------|------|----------|----|
| 35 | 5 | 1 | 35 |
| 25 | 10 | 2 | 50 |
| 15 | 20 | 10 | 40 |
| 10 | 20 | 4 | 40 |
| 5 | 10-5 | 3 | 15 |
| <hr/> | | <hr/> | |
| 60 | 12 |) 180(15 | |

RULE VI.—Extension of Rule III to cover all cases of more than two ingredients. If known amounts of ingredients and their values are given, or a fixed amount of the desired intermediate value is sought, to find the amounts of other ingredients needed and the total amount of product produced, proceed as follows:

1. Apply Rule I for known quantities with known values, if more than one is given, and use the result as one ingredient with a known value.

2. If the total amount desired is given apply Rule IV.

3. Apply Rule II, or Rule V, as the case may require.

4. Total the parts.

5. Simplify the parts.

6. Use $x, x', x''; y, y', y''$ and z ;

x, x', x'' , etc., representing the stronger ingredients,

y, y', y'' , etc., representing the weaker ingredients,

z , representing the total.

7. Substitute the known amounts opposite their proper values and parts, and solve for x, x' , etc., y, y' , etc., and z by ratio and proportion.

8. Prove result by use of Rule I.

Example VIa:

How much water must be added to 40 Gm. 80% acid, and 200 Gm. 56% acids to make an acid 20%?

$$80 \times 40 = 3200$$

$$56 \times 200 = 11200$$

$$240 \quad) \quad 14400 \quad (\quad 60$$

$$\text{Proof: } 60 \times 240 = 14400$$

$$0 \times 480 = 0$$

$$720 \quad) \quad 14400 \quad (\quad 20$$

$$14400$$

Therefore 480 Gm. of water must be used.

Example VIb:

How much of 5% and 10% acid may be added to 420 Gm. of 50% acid to make it 25% and what amount of product will be made?

$$50 \quad 15 + 20 = 35 \quad 7 \quad x \quad 420$$

$$25 \quad 10 \quad \quad \quad 25 \quad 5 \quad y \quad 300$$

$$5 \quad \quad \quad 25 \quad 5 \quad y' \quad 300$$

$$85 \quad 17 \quad z \quad 1020$$

$$\text{Proof: } 50 \times 420 = 21000$$

$$10 \times 300 = 3000$$

$$5 \times 300 = 1500$$

$$1020 \quad) \quad 25500 \quad (\quad 25$$

$$2040$$

$$5100$$

$$5100$$

$$7 : 5 :: 420 : y, \text{ or } y = 300.$$

Therefore, 300 Gm. each of 5% and 10% acid may be added to 420 Gm. of 50% acid, and the total amount of the product will be 1020 Gm. of 25% acid.

Example VIc:

How much 95% and 50% sulphuric acid must be added to 380 Gm. of water to make it 25%?

$$\begin{array}{r r r r r r}
 95 & 25 & & 5 & x & 100 \\
 25 & 50 & 25 & & 5 & x' & 100 \\
 & 0 & 25-70 & 19 & y & = & 380 \\
 \hline
 & 145 & & 29 & z & = & 580
 \end{array}$$

$$\begin{array}{r r r r r r}
 \text{Proof: } 95 & \times & 10 & = & 9500 \\
 50 & \times & 100 & = & 5000 \\
 0 & \times & 380 & = & 0 \\
 \hline
 & & 580 &) & 14500 & (\ 25 \\
 & & & & 1160 & \\
 \hline
 & & & & 2900 & \\
 & & & & 2900 & \\
 \hline
 & & & & &
 \end{array}$$

$$19 : 5 :: 380 : x, \text{ or } x = 100.$$

Therefore, 100 Gm. each of 95% and 50% acid may be added to 380 Gm. of water to make it 25%, and the total amount will be 580 Gm.

Example VI*d*:

How much 80%, 60% and 30% alcohol may be used to make 1000 Gm. of 50% alcohol?

$$\begin{array}{r r r r r r}
 80 & & 20 & 1 & x' & 250 \\
 50 & 60 & & 20 & 1 & x' & 250 \\
 30 & 10 & + & 30 & 2 & y & 500 \\
 \hline
 & 89 & & 4 & z & = & 1000
 \end{array}$$

$$\begin{array}{r r r r r r}
 \text{Proof: } 80 & \times & 250 & = & 20000 \\
 60 & \times & 250 & = & 15000 \\
 30 & \times & 500 & = & 15000 \\
 \hline
 & & 1000 &) & 50000 & (\ 50
 \end{array}$$

Therefore 250 Gm. each of 80% and 60% alcohols, and 500 Gm. of 30% may be used to make 1000 Gm. of 50% alcohol.

Example VI*e*:

Given 250 Gm. 4%; 100 Gm. 10%; 50 Gm. 16% materials; how much 9, 11, 13, 17 and 18% substances of the same kind may be used to make 1400 Gm. of 12%. Let the substance be opium.

$$\begin{array}{r r r r r r}
 1. \quad \text{Rule I.} & & 4 & \times & 250 & = & 1000 \\
 & & 10 & \times & 100 & = & 1000 \\
 & & 16 & \times & 50 & = & 800 \\
 & & & & & \hline
 \end{array}$$

$$\begin{array}{r r r r r r}
 2. \quad \text{Rule IV.} & & & & 400 &) & 2800 & (\ 7\% = \text{value of given materials} \\
 & & 7 & \times & 400 & = & 2800 \\
 & & ? & \times & 1000 & = & 14000 \\
 & & & & & \hline
 \end{array}$$

$12 \times 1400 = 16800 = 14\%$ value to be obtained from the other ingredients, and this must total 1000 Gm. which with the 400 Gm. of 7% will make the 1400 Gm. of 12%.

$$\begin{array}{r r r r r r}
 \text{Rule V.} & & 9 & 3 & & y'' & 150 \\
 4. & & 11 & 4 & & y' & 200 \\
 5. & & 13 & 4 & & y & 200 \\
 6. & & 17 & 5 & & x' & 250 \\
 7. & & 18 & 3 & + & 1 & x & 200 \\
 & & & & & & \hline
 & & 20 & & & z & = & 1000
 \end{array}$$

8. Rule I. Proof:

$$\begin{array}{r r r r r r}
 8 & \times & 250 & = & 1000 \\
 9 & \times & 150 & = & 1350 \\
 10 & \times & 100 & = & 1000 \\
 11 & \times & 200 & = & 2200 \\
 13 & \times & 200 & = & 2600 \\
 16 & \times & 50 & = & 800 \\
 17 & \times & 250 & = & 4250 \\
 18 & \times & 200 & = & 3600 \\
 \hline
 & & 1400 &) & 16800 & (\ 12 \\
 & & & & 1400 & \\
 \hline
 & & & & 2800 & \\
 & & & & 2800 & \\
 \hline
 \end{array}$$

Therefore, to 250 Gm. 4%, 100 Gm. 10%, and 50 Gm. 16% opium, which in all makes 400 Gm. 7% opium, in order to make 1400 Gm. of 12% opium, there must be added 1000 Gm. of 14% opium, and this latter can be made by mixing together 150 Gm. of 9%, 200 Gm. of 11%, 200 Gm. of 13%, 250 Gm. of 17%, and 200 Gm. of 18% opium.

This last problem will be seldom met with, but really shows how such a difficulty can be solved. I have had occasion to use such problems in actual practice, in the manufacturing and dispensing of preparations.

DEPARTMENT OF PHARMACY,
UNIVERSITY OF NEBRASKA.

OFFICIAL NAMES FOR SYNTHETIC DRUGS.

To the Editor:

It is important that pharmacists should be familiar with the official names for synthetic drugs so far adopted by the Federal Trade Commission. These are:

Arsphenamine for salvarsan, diarsenol and arsenobenzol, etc.

Neoursphenamine for neosalvarsan, neodiarsenol and novarsenobenzol, etc.

Barbital for veronal.

Barbital-sodium for medinal and veronal-sodium.

Procaine for novocaine.

Procaine nitrate for novocaine nitrate.

Phenylcinchoninic acid for atophan.

Under the authority of the Trading with the Enemy Act and with the advice of the Subcommittee on Synthetic Drugs of the National Research Council, the Federal Trade Commission has provided for the manufacture in this country of the important synthetic drugs which before the war were imported from abroad, chiefly from Germany.

To insure the production of the synthetic drugs urgently needed, the Federal Trade Commission had to make it worth while for manufacturers to undertake the preparation of these articles without permitting their cost to become prohibitive but rather approaching the prices current before the war. This was accomplished by granting licenses good for the life of the patents under which such drugs are made and thus making a permanent investment for their production profitable. Partly to insure for manufacturers a market for their products after the war and in large part inspired by the idea of encouraging the establishment of a permanent American industry in these important articles, the Commission wisely decided that American houses should be put on the same footing as the foreign houses for the after-the-war competition by imposing on all licenses the obligation to use new, official names for the articles, names which after the war will be open to all competitors, domestic and foreign.

Obviously if these names are once in common use the exclusive rights of the foreign houses and their agents of using after the war the old established trademarked names will not seriously handicap the American firms, and all competitors will be on the same footing, with the advantage only to those who can produce most cheaply the better article.

It is obvious that the American physician in final instance is the arbiter who can put this wise plan into operation and establish the new names firmly by prescribing these remedies by their new official names. However, *the adoption of these names by physicians will depend very largely on the pharmacist's familiarity with them.* Unless the physician is confident that the pharmacist to whom his prescription is taken is familiar with the official names, he will feel constrained to use the old, proprietary names. The pharmacist, therefore, should familiarize himself with the new, official non-proprietary names given at the beginning of this letter.

Yours truly,

JULIUS STIEGLITZ, *Chairman*,
SUBCOMMITTEE ON SYNTHETIC DRUGS
NATIONAL RESEARCH COUNCIL.

UNIVERSITY OF CHICAGO,
CHICAGO, ILL.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

DETROIT.

The first meeting of the 1918-19 season of the Detroit Branch, A. Ph. A., was held October 23, at the Wayne County Medical Building, with Prof. E. R. Jones, the new president, in the chair.

Miss May Strawn, the secretary, having left the city, Fred Ingram was elected to fill the vacancy.

Hugh Craig, director of advertising of the Nyal Company, gave a talk on "YEAST, a substance much needed in business." He defined yeast by giving a meaning to each of the five component letters:

Yoursel
Economy
Attraction
Service
Thought

By putting *yourself* in your business, making your store reflect your own individuality, exercising *economy* in buying, selling, and store management, making your store *attractive* to customers by pulling windows, interior display, and occasionally changing the internal arrangements; rendering *service*, not servitude; and taking time to give real constructive *thought* to your business, Mr. Craig showed us that we put leaven in our business that is bound to make it rise. His stimulating talk would have benefited every retailer in the city.

This talk impels us to urge every pharmacist in the city to attend these meetings regularly. They are free, open to all, and every one who comes learns something that, properly adapted, brings him additional monetary profit.

This talk was discussed over doughnuts and cider. Many valuable ideas were brought out. Every one contributed his share.

FRED INGRAM, *Secretary*.

NOVEMBER MEETING.

After a dinner at the Fellowcraft Club, President Jones called the meeting to order at 8.30 P.M., forty being present.

A letter of greeting from E. G. Eberle was read and placed on file.

Mr. Grommet, Chairman of the Program Committee, outlined his plans for the season and asked for suggestions regarding having a social evening with the ladies present.

Mr. Hall, to formally bring the matter up, moved that we have a social evening at which the ladies be present, the program to be arranged by the officers. Supported, carried.

It was also moved and supported that a dinner precede each of our monthly meetings. Carried.

Henry Kraemer, professor of Pharmacognosy at the University of Michigan and ex-president of the American Conference of Pharmaceutical Faculties, was then introduced. He stated that the present war situation compelled an introspection into the condition of our profession, particularly since Surgeon General Gorgas, of the Army, had declared, regarding the establishment of a Pharmaceutical Corps, that pharmacy was a non-essential specialty. To ascertain for us the facts which caused Doctor Gorgas to make that statement, Doctor Kraemer sketched the prevailing condition of the retail drug business, the part most accessible to the outsider, and asked if pharmacy as now practiced in the majority of cases would inspire a belief among ourselves or outsiders in its essential status.

Dr. Kraemer's endeavor is to create the ideal type of pharmacist who, he said, was the professional type including the manufacturer, the scientist, and the prescriber.

The Technical High School can be made part of the program by serving to train men for pharmacy who can be used in stores as helpers and, if ambitious, they would then go on

in the profession, eventually attending the university type of schools.

In order to bring about this contemplated regeneration it is necessary for the boards of pharmacy to have more power. A man with no education or training can practice pharmacy by merely passing the State Board. He asserted that a preliminary education should be a requirement in order to produce men of real professional standard.

He then showed us slides of various drug store window displays which might lead anyone to question the essential status of pharmacy as practiced to-day.

This was followed by portraits of the pioneers and leaders in our profession, among them Pasteur, Gignard, Reiss, Flückiger, Hanbury, Schlotterbeck, Prescott and Stevens, men who believed in pharmacy and have been recognized as high class professional men. In closing he stated that there was need of more such leaders and he urged that we all think and act.

Mr. Seltzer, in the discussion which followed, expressed his sympathy with Doctor Kraemer's ideals. In order to bring them about, he stated, it was necessary to secure the reform through the legislature, and therefore we must appeal to the people to convince them of its necessity.

Mr. Webster stated it was necessary to see the druggists on the general proposition, since the opposition to the last "prerequisite" bill came from the druggists themselves.

Mr. Weaver said that the need for trained men is greater now than ever, and that educated pharmacists will be considered essential as they show themselves worthy.

Mr. Mann feared that druggists lacked the courage of their own convictions, he said that most of them want higher standards but will not work to secure them. It is up to us as pharmacists to bring this about, just as the medical profession raised their own standards and thereby increased their professional standing.

Doctor Kraemer at this point mentioned the official recognition of pharmacy in the Students' Army Training Corps.

Mr. Schettler briefly sketched the development of his career. Originally making most of his galenicals, the lower prices of the manufacturing pharmacists eventually caused him to largely abandon this practice. The separation of commercial from professional pharmacy would be the solution. On the other hand, it takes little professional skill to compound most of the prescriptions as written by physicians to-day.

Mr. Hall urged a faithfulness to our ideals, to our ambition for better pharmacy and that we inspire enthusiasm for our ideals in our employees.

Mr. Mason stated that he did not deplore the advent of commercialism, and that we have not gone down hill. He said he was certain that Geo. B. Evans, the leading commercial druggist, takes considerable pride in his prescription department and has many practical innovations in that department that merit imitation.

He believed that the professional pharmacy is gradually being developed. Economic conditions are responsible for the present status and the pendulum will no doubt swing back from extreme commercialism in due time. He agreed with Doctor Kraemer in the division of pharmaceutical education into two schools, one to train men to run drug stores, the other to train professional pharmacists. Evolution, not revolution, will bring about the desideratum, he said.

Doctor Stevens believed evolution would solve the problem; without blaming the druggist for the existing conditions, he felt that we were not elevating our standards by the types of pharmacies existing to-day.

Mr. Rohnert said a highly trained man is not needed to run the average drug store, and that it would be a mistake to make the standards too high.

W. L. Scoville said that such a complex matter deserves a great deal of consideration. Some commercialism is necessary in every profession. How is this thing looked at on the outside? That is the ladder on which we must climb.

Hugh Craig believed it best to have both kinds of pharmacy in one store. Both kinds can be cleansed and improved. The professional side must not be submerged but should be emphasized, developed and better regulated by the boards of pharmacy.

There were further discussions by Messrs. Bye, Blome, Moore and Buzzell.

It was moved, supported and carried, that our December meeting be advanced one week.

It was moved, supported and carried that Frederick Stearns & Co. be given a vote of thanks for their kindness in extending to us the use of their lantern and operator for this meeting. Carried.

It was moved and supported that Doctor Kraemer be given a rising vote of thanks for his good and interesting talk. Carried.

The meeting adjourned at 11.45 P.M.

FRED INGRAM, JR., *Secretary.*

CHICAGO.

The ninety-eighth monthly meeting of the Chicago Branch of the American Pharmaceutical Association was held at the City Club, Wednesday evening, November 20th, with forty members and visitors in attendance.

The meeting was preceded by a dinner. Vice-President Clark presided.

Minutes of the previous meeting having been published were approved without reading.

William Gray reported for the Membership Committee that sixty-five new members had been received during the year ending September 1, and that sixteen members had been lost, two of these, Louis C. Deck, of Girard, and F. C. Shapper, of Chicago, by death. Since September 1, seven new members have been received and three lost by death, namely, Dr. Carl Lutz, of Ottawa, Messrs. Chas. Fuller and Fred M. Schmidt, of Chicago. The total membership is now two hundred.

Representatives of all the pharmaceutical organizations centered in Chicago were present and entered into the subject of the evening: "What Has Organized Pharmacy Done in the War? What Are the Pharmaceutical Reconstruction Problems?"

The great work of the N. A. R. D. being accomplished through Secretary Henry and Counsel Eugene Brokmeyer at Washington was recognized. Pharmacy has given ungrudgingly of her young men to the Service, many thousands of them, and now the problems of restoring these men to their former places in business and professional life are before us. In Mr. Brokmeyer, the retail druggist has a man right on the ground and, backed up by the great organization behind him, ready to take advantage of every opportunity for the betterment of conditions in retail pharmacy. There is good prospect that the great stringency of competent help in drug stores will soon be relieved by the return to civil life of many pharmacists from the military and naval forces.

The A. Ph. A. has provided for a committee to look after the needs of pharmacists returning from the war forces. This committee, headed by F. H. Freericks of Cincinnati, has outlined its plans under a broad scope and a very comprehensive questionnaire will soon be presented to every retail pharmacist, by which information will be sought as to pharmacists and assistant pharmacists in the military or naval service, and as to providing places in

the drug business for these men upon their return. The committee also plans to look after the completion of their pharmaceutical education and to provide special facilities for their registration. The committee desires to work with committees from State and local organizations so that there may be a personal touch given to the work.

Secretary Wm. B. Day referred to Chairman Hilton's report on the status of the pharmacist in the Army and Navy. He stated that, even though the formation of a pharmaceutical corps in the Army had not so far been accomplished, with the ending of the war and a better understanding of the wishes of the pharmacists by the leading medical officers of the Army, the prospects for obtaining such a corps were not dead by any means. He urged that every effort be brought to bear upon Congress to bring about this much-desired result. The A. Ph. A. has purchased liberally of Liberty Bonds from its funds.

The C. R. D. A. was represented by President Umenhofer who summarized the war activities of this strong local organization as follows: Every member of the C. R. D. A. responded to the request of the Red Cross that prescriptions for dependent families of soldiers and sailors be filled without charge, or at actual cost. There are stores where more than sixty of such prescriptions have been filled and not a single druggist has rendered an account to the Red Cross for reimbursement. The C. R. D. A. War Fund, instituted through Mrs. Walgren, a veteran of the Spanish-American War, has grown to a considerable size, and is being disbursed to needy pharmacists in the Service and to sick and disabled pharmacists who have returned from the front. The Woman's Organization of the C. R. D. A. has charge of these disbursements. C. R. D. A. members rendered a marked service in connection with the great War Exposition by selling more than 100,000 entrance tickets. This service was highly appreciated by the War Exposition Committee. C. R. D. A. members are systematically assisting in the sale of War Savings Stamps and many members have volunteered as Liberty Bond salesmen. The C. R. D. A. has purchased Liberty Bonds from its own funds and the purchases of these bonds by the individual members will average very high. The number of C. R. D. A. members in the Service is approximately 140.

Mrs. J. H. Riemenschneider spoke for the Woman's Organization of the C. R. D. A.

Among their activities she mentioned: An active interest in the Sunbeam League of the Red Cross; more than 500 books to the War Libraries; 55 pairs of woolen socks knitted for pharmacist soldiers from yarn purchased by their organization; the sale of \$67,100 of Fourth Liberty Loan Bonds; purchase of Liberty Bonds by the organization and by every member of the organization so that their chapter was 100 percent. Their service flag has twenty blue stars.

The Chicago Drug Club, represented by President Otto Mentz, has thirteen members in the Service and also thirteen sons and daughters. The members are most thankful that no gold stars need be added to their flag. The Club has subscribed for Liberty Bonds.

Mr. Christensen, speaking for the National Association of Boards of Pharmacy, stated that their organization had purchased Liberty Bonds.

The Chicago Veteran Druggists' Association was represented by E. Von Hermann, who read a letter from Secretary Bodemann. Mr. Bodemann stated that from their membership of thirty, there were nine blue stars, representing nine sons or grandsons in the Service, and two gold stars. The organization has purchased Liberty Bonds and given to the Red Cross. Despite the fact that a large proportion of their members are German-born or of German parents, nothing but the finest loyalty to our country has ever been expressed in their meetings and no quarrels or harsh words have been spoken there.

Fred Elsner spoke for the I. Ph. A. Travelers' Association. He stated that while they never had a free balance in their treasury, it was because they drew such large drafts for maintenance of the morale of the war-stricken retail druggists.

By special request, Dr. Bernard Fantus responded for the A. M. A. Secretary Simmons, of the A. M. A., upon being asked what he considered as the most valuable service of the A. M. A. in the war, replied, "the keeping of quacks and incompetents out of the Medical Corps." Their card index of every practicing physician and surgeon of the United States had been freely consulted by the Surgeon General's office. An endeavor had been made to leave, in every community, as many physicians as were really needed. Of the 81,000 members of the A. M. A., 33,884 are in the Service. Many have been killed and wounded.

Doctor Simmons also stated that the American Medical Association favored a well-trained

pharmaceutical corps for the Army. He believed that the chief reason for the Surgeon General's ruling against the establishment of such a corps was the lack of standard educational qualifications for pharmacists.

Prof. W. B. Day, speaking for the U. of I., School of Pharmacy, stated that an incomplete list of alumni in the Service totalled 110, and that under-graduates of last year's classes were in Service, while of this year's classes 70 were in the Students' Army Training Corps.

The following motions were adopted:

"That the Chicago Branch, A. Ph. A., assembled in regular meeting at Chicago, November 20th, endorse the plans of the Advisory Committee of the American Pharmaceutical Association for Soldier and Sailor Pharmacists as outlined in communications from Chairman Freericks and reviewed by Member H. C. Christensen.

"That a committee of three members of the Chicago Branch be appointed by the Chairman to coöperate with the Advisory Committee of the American Pharmaceutical Association for Soldier and Sailor Pharmacists.

"That the Chicago Branch respectfully request the Department of Education and Registration of Illinois to include in the form for renewal of certificate to be mailed to pharmacists and assistant pharmacists the following question:

'Are you or have you been in the military or naval service of the U. S.? If so, what Branch and Unit?'

"That Article 10 of the By-Laws be amended by striking out 'Friday' and substituting therefor 'Tuesday' so that Article 10 will read 'Meetings—Meetings shall be held on the third Tuesday of each month, except during the months of June, July, August and September, etc.' "

E. N. GATHERCOAL, *Secretary*.

NEW YORK.

The November 1918 meeting of the New York Branch of the American Pharmaceutical Association was called to order by President Turner in the lecture hall of the New York College of Pharmacy Building, on Monday evening, the 11th, at 8.30 o'clock.

There were fifty members present.

The regular order of business was changed at the request of Dr. Royal S. Copeland, Commissioner of the Department of Health, who

gave an address on "The Present Epidemic and the Work of the Health Department."

It was now moved, seconded and carried that the privilege of the floor be extended to all present. There followed a discussion by Dr. Runyon, Mr. M. Zagat, Dr. Diner, Dr. Hostmann, and Dr. Anderson. A rising vote of thanks was then tendered Dr. Copeland.

Progress of Pharmacy.—Dr. Dickman, because of the late hour, brought in no report.

This completed the Scientific Session.

BUSINESS SESSION.

Because of the late hour the reading of the minutes was dispensed with.

Treasurer's Report.—The Treasurer's report was read and ordered accepted.

Committee on Fraternal Relations.—Dr. Lascoff brought in no report.

Audit Committee.—Dr. Diner brought in a report which was ordered accepted.

Committee on Education and Legislation.—Mr. Lehman brought in a report which was discussed by Dr. Rehfuß and ordered accepted.

Membership Committee.—An application from Mr. Kenneth A. Bartlett, care of E. R. Squibb & Sons, Brooklyn, N. Y., was received for membership in the Parent Organization and the following three applications for membership in the Local Branch:

Mr. Emil Roller, 574 Amsterdam Ave., New York City; Eugene L. Maines 245 Quincy St., Brooklyn, N. Y.; Chas. H. Stocking, 3 Park Place, New York City.

The death of Dr. Niece was reported. Appreciations of Dr. Niece were delivered by Dr. Mayer and Mr. Mayo. It was moved, seconded and carried that a committee be appointed to draw up suitable resolutions. The committee consisted of Dr. Mayer, Mr. Mayo and Mr. Bigelow.

Dr. Lascoff and Mr. Fisher discussed the Ambulance Committee's work.

Under regular procedure the meeting was declared adjourned.

HUGO H. SCHAEFER, *Secretary*.

PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held at the Philadelphia College of Pharmacy, Monday evening, November 18, with President W. W. McNeary in the chair. The usual business matters were dispensed with, due to the lengthy program, and after the election of three new members, E. G. Eberle presented a report of the annual

convention of the American Pharmaceutical Association. This was done comprehensively and with the speaker's usual thoroughness and tact. J. C. Peacock then read a concise but interesting report of the Pennsylvania Association's successful meeting. The National Wholesale Druggists' Association was represented by Dr. Adolph Miller, whose very enjoyable report is usually looked forward to each year by Branch members. Elmer Hessler briefly reviewed his trip to the Annual Chemical Exposition exhibited in New York, and spoke of the resourcefulness of the Yankee chemist. The main topic of the evening was then opened with the reading of a paper by Dean Charles H. LaWall, who characteristically termed his essay:

"BOLSHEVISM IN AMERICAN PHARMACY."

Attempting to summarize this paper is out of the question; it is to be published in the JOURNAL of the Association. It is well worth careful perusal and digestion. Dealing as it does with the question of the separation of the professional from the commercial, it treats of a present-day problem that is not only confronting the educators, but also every retail druggist or pharmacist in the country. The title is undoubtedly well chosen when one considers the most recent definition of the Bolsheviki—individuals whose heads are in Arcadia and their feet still on the old terrestrial sphere.

Following Professor LaWall's able paper, Doctor Sturmer delivered one of his careful and analytical speeches. He dealt particularly with the effect of the war on American pharmacy and very dramatically pointed out that the pharmacists who had remained behind had "kept the home fires burning bright." Pharmacy still prospers, even if there was a disposition in Washington to ignore it. Attention was called to the reliance placed upon pharmacists in Philadelphia's hour of trouble when the grim reaper came so suddenly and demanded such a heavy toll, and it is not said that they were at all lacking in their duties as public servants. Doctor Sturmer stated that pharmacy can look to the future with confidence and that, despite opposition and apathy, it will in due course establish itself firmly with its sister professions, all of which had to find their place in the sun only after a tedious evolutionary process that required decades for its consummation.

Samuel C. Henry, of Chicago, and an honorary member of the Branch, was a welcome

visitor and expressed his gladness at being back with his friends in his usual sincere fashion. The topic of the evening was keenly discussed by a number of the members. Doctors Lowe and Bernstein, Messrs. Peacock, Cliffe, Hunsberger, and Beringer, were particularly prominent in stating their views on the question. The latter four members were

able to present views which were peculiarly interesting in that they are four retail pharmacists whose business acumen, as well as their high professional rating, is beyond questioning.

The meeting adjourned at 11.15 and was undoubtedly highly instructive and interesting.

IVOR GRIFFITH, *Secretary*.

COMMITTEE REPORTS

REPORT OF COMMITTEE ON THE U. S. PHARMACOPOEIA, AMERICAN PHARMACEUTICAL ASSOCIATION.*

It has been exceedingly difficult to secure observations, criticism or suggestions from the various members of the committee. The reasons therefor are probably due to the present disturbed conditions, not only in United States, but the world over. There are, however, submitted herewith a number of observations, suggestions and criticism which it is believed will be of service in the working out of the 10th decennial revision of the U. S. Pharmacopoeia.

The question of ash content in drugs should receive careful investigation. This material finds its way into the whole and powdered drugs through various avenues. Some of the plants are grown in sandy soil and the silicious matter may be greatly augmented by the simple, mechanical adherence of the sandy matter. The nature of the drugs is sometimes such as to make it very difficult to remove the inorganic matter from the plants either at the time of gathering or subsequently. In many instances the ash content varies greatly with the nature and character of the soil in which the plants are produced. The ash content of the same drugs grown in the same field often varies materially. It is believed all of these factors should be carefully worked out, from the commercial, botanical, analytical and other points of view. It is not believed that with our present limited knowledge very much dependence can be placed upon ash limitations.

The present standard for maximum ash content for rhubarb is 1.3%. Excellent specimens of whole rhubarb have been met with containing very much higher percentage of ash. In the case of powdered drugs the miller is sometimes looked upon with suspicion when there is really no foundation for such a suspicion and every effort should be made to correct questioned standards, which would tend to reflect unjustly upon manufacturers and dealers.

CANNABIS INDICA The present physiological method contained in the Pharmacopoeia for testing *Cannabis Indica* has been subject to repeated criticism. A detailed criticism has been referred to the Committee on Revision. It is believed that the question should receive very careful and thorough consideration.

CREOSOTE: Manufacturers have repeatedly complained relative to the so-called glycerin test for the alleged detection of "coal-tar creosote" in creosote. The point raised was that this test discriminates against the American-made creosote in favor of imported product. It is believed that this criticism should be carefully investigated and, if found correct, the test should be modified.

Several members of the committee have made suggestions and criticism which are submitted as received and are as follows.

H. ENGELHARDT.

ACETUM SCHLLAE: This preparation should be omitted because it is therapeutically not sufficiently active.

ACID BENZOIC: A more definite test for distinguishing between the natural and synthetic acid should be given.

ACID HYDRIODIC: The residue left after evaporating and incinerating 5 mls of the acid is not potassium carbonate as is usually accepted but is potassium iodide which volatilizes when too high a heat is applied. Therefore it should be stated that the heating should be carried out only at dull redness.

* Presented at Chicago meeting American Pharmaceutical Association, 1918.

ACID LACTIC: In the assay process it is stated that a certain amount of the acid be poured into a tared and stoppered bottle. How can this be done? The phraseology should be changed.

ACID PHOSPHORIC: It would be advisable to change the assay process which is a very cumbersome one.

ACID SALICYLIC: More definite tests for distinguishing between natural and synthetic acids should be given.

ACID SULPHURIC AROMATIC: The assay process given in the Pharmacopoeia is wrong. It would be advisable to adopt the process published by Penniman and Randall in the *Jour. Indus. & Eng. Chemistry* for October 1916.

ACONITINE: Physiological test of the alkaloid should be given because commercial samples vary very widely in toxicity.

ACONITE AND ITS PREPARATIONS: The assay process should be thoroughly revised as the chemical results are not in proportion to the physiological results. It is impossible to obtain a definite end point when using cochineal as indicator. Methyl red therefore should be used, by which results are obtained which indicate the toxicity of the drug better than the results obtained with cochineal.

CANNABIS: If physiological tests for this drug and its preparation are to be retained a reliable method should be given. The present method gives results which are far from satisfactory.

CAPSICUM: We have found that in some years it is impossible to obtain 15% of ether-soluble oleoresin from the average commercial drug. The drug seems to be subject to considerable seasonal variation.

CODEINE AND ITS SALTS: Why is only an assay process for Codeine Phosphate given and not for the alkaloid and the sulphate?

CRESOL: Commercial cresol is not always soluble in 60 parts of water.

DIGITALIS: The physiological assay method should be revised and the one-hour frog test preferably be replaced by the 12-hour frog or still better by the cat method.

EMETINE HYDROCHLORIDE: The U. S. P. states that emetine hydrochloride contains variable amounts of water. A properly prepared salt contains about 7 molecules of water of crystallization which would correspond to the 19% of moisture permitted by the U. S. P.

F. E. PODOPHYLLUM: A standard should be given.

F. E. SQUILL: The manufacturing method should be revised. A detailed paper on this subject will be submitted by Messrs. Grantham and Colson at the Chicago meeting of the association. (Printed in November issue of the *JOURNAL*, p. 940.)

MERCURY SALICYLATE: The assay process might well be simplified. It can be carried out by treating a weighed amount of the sample with sulphuric acid and nitric acid and titrating the solution thus obtained with potassium sulphocyanide as directed under mercury.

LINIMENT OF CAMPHOR: The limits of the requirements are too narrow considering the difficulties which are encountered in the assay process.

LIQUOR ARSENIC AND MERCURY IODIDE: It has been stated that the arsenic in the arsenous state is easily oxidized into arsenic in the arsenic state. It would therefore be advisable to make in addition to the estimation of the arsenous arsenic a determination of the total arsenic.

LIQUOR CRESOLIS COMPOUND: A method for the estimation of the water in the preparation should be given since this preparation comes under the Insecticide Act which requires a statement of the inert ingredients, in the preparation.

HYDROGEN PEROXIDE: A method for estimating the acidity should be given. By the present method only one-half of the acidity is estimated.

LIQUOR POTASSIUM ARSENITE: The total arsenic in Fowlers Solution should be estimated in addition to the estimation of arsenous arsenic. Under certain conditions an oxidation of the arsenous arsenic to arsenic is liable to occur.

MAGMA BISMUTHI: The electrolytical process should be given as an alternative method. By simply evaporating a definite quantity of the magma to dryness and weighing the residue, soluble salts present in the preparations are estimated also.

OLEATE OF MERCURY: An assay process should be given.

OLEORESIN MALEFERN: An assay process should be given.

PANCREATIN: The milk test should be omitted.

PODOPHYLLIN: More details of the assay method should be given.

POTASSIUM CHLORATE: Why is test for nitrites and nitrates omitted?

QUININE AND ITS SALTS: Kerner's test as given in the U. S. P. for foreign cinchona alkaloids is too lenient.

RESIN JALAP: Details for estimating the solubility in ether and chloroform should be given.

SODIUM PHOSPHATE: The assay process is very cumbersome.

SPARTEINE SULPHATE: Assay process should be given.

SPIRIT AMMONIA AROMATIC: The alkalinity should be determined.

STROPHANTHIN: Physiological assay method should be given.

STRYCHNINE AND ITS SALTS: Assay methods should be given.

SYRUP OF IPECAC: Why is acetic acid added when the fluidextract already contains hydrochloric acid?

SYRUP OF SQUILL: Why not make this preparation with fluidextract of Squill?

TINCTURE IODINE: The percentage of alcohol is given at 83%, while theoretically it is 87%.

TINCTURE GINGER: Standard for total solids should be more definitely stated.

UNGUENTUM HYDRARGYRI: Considering the difficulty experienced in making this ointment the limits for required percentage of mercury should be extended.

E. P. BIGELOW, SUBMITTED BY E. H. LAPIERRE.

IMPURITIES IN POTASSIUM CARBONATE AND BICARBONATE.

RECOMMENDATIONS FOR ADDITIONAL U. S. P. TESTS.

During the past twelve years the writer has had occasion, as a matter of routine, to examine a great many samples of high grade Potassium Bicarbonate and for several years many samples of Potassium Carbonate also, and the requirements for the purity for these salts as given in the U. S. P. both 8th and 9th revisions have been found inadequate.

The purchaser of products conforming to the U. S. P. standards should at least expect to be safeguarded against the possibilities of *dangerous* impurities; nevertheless, such is not the case as regards KHCO_3 or K_2CO_3 . These dangerous impurities have been found in K_2CO_3 prepared before the War under normal conditions of production and manufacture as well as in that now produced and on the market. Traces of these impurities have been occasionally found in KHCO_3 .

The requirements of the B. P. on the other hand are more stringent as regards these two salts and with few exceptions are open to but little criticism. For this reason it is to the advantage of the manufacturer to specify B. P. instead of U. S. P. when purchasing K_2CO_3 or KHCO_3 .

Based on the writer's experience the most objectionable impurities not provided for in the U. S. P. are as follows:

1. ARSENIC: This has been found in high grade calcined K_2CO_3 in amounts varying from 10 parts per million to as high as approximately 100-200 parts per million, and possibly even in larger amounts, as the total quantity was not always determined. Certainly an excessive figure, and as K_2CO_3 is often used in medicinal preparations the presence of such a product would be fraught with much danger.

Arsenic has been found in KHCO_3 in *traces* only and then usually in the powdered salt. Some hydrated K_2CO_3 tested showed 10 parts per million. The British Pharmacopoeia (see U. S. Dispensatory, 20th Ed., page 894) limits the arsenic content in K_2CO_3 to 2 parts per million and in KHCO_3 (page 883) to 5 parts per million. The only test in the U. S. P. at all applicable is the "Time Limit Test" for heavy metals, which is entirely inadequate for arsenic in such quantities. The writer uses a modified Marsh method with a preliminary treatment of the product with HNO_3 and H_2SO_4 .

2. CYANIDE COMPOUNDS: These may be present in Potassium Carbonate (or possibly bicarbonate) prepared by the Leblanc process in which coal containing appreciable amounts of nitrogen is employed, or from any source where the ignition of nitrogenous matter takes place during the process. Cyanide compounds have been found in quite a number of

samples of high grade calcined K_2CO_3 and in a few cases in appreciable amounts. Preliminary tests indicated ferrocyanide. One sample of a poor grade contained KCN. No cyanides have been found in the samples of $KHCO_3$ examined.

The British Pharmacopoeia allows no characteristic reactions for cyanides in K_2CO_3 , and Merck, "Chemical Reagents, Their Purity and Tests," 1914, page 129, provides a test for KCN in K_2CO_3 . Krauch, "Testing of Chemical Reagents," 3rd Ed., on page 225, also gives a test for KCN in K_2CO_3 .

The writer employs a modified Prussian blue test which is accurate and sufficiently delicate (except in the presence of chlorates). The test is as follows: Introduce 1.8 Gm. of calcined K_2CO_3 , or 2.8 grammes of $KHCO_3$, into a dry test tube, capacity about 40 mils. Add 0.100 Gm. powdered ferrous sulphate (or more if necessary), mix, and next add 4 mils distilled H_2O and 0.5 mil 10% NaOH in the case of the K_2CO_3 and 2 mils 10% NaOH and $3\frac{1}{2}$ mils H_2O in the case of $KHCO_3$. Then in both cases mix well, put in water-bath (temp. $140-160^\circ F.$) and allow to remain about 10 minutes, occasionally shaking to insure complete solution. Next add to each tube 2 drops 10% $FeCl_3$, mix and at once add enough conc. HCl to render solution slightly acid (add acid very cautiously to avoid loss from effervescence), usually takes about 2.8 to 3 mils.

Examine tubes for¹ greenish coloration or precipitate, comparing with pure control and one containing a known amount of KCN. Then allow to remain for a few hours or over night, filter through a Whatman No. 44, 11 cm. "wetted" filter, wash with water and examine for traces of blue residue of ferric ferrocyanide. This test readily detects 0.00004 Gm. KCN in K_2CO_3 and 0.0001 Gm. in $KHCO_3$.

The addition of dry powdered ferrous sulphate or the dry sample in the test tube, before adding the alkaline hydroxide solution and water, prevents any interference from sulphur compounds sometimes present in K_2CO_3 . It is very essential that the test should be filtered, otherwise traces of the blue precipitate are apt to escape detection. The presence of chlorates renders the test unreliable.

3. SULPHOCYANATES: KCNS has been found very frequently in calcined and hydrated K_2CO_3 in amounts varying from 0.01% to as high as 0.09%. Traces have been found in $KHCO_3$.

4. CHLORATES: This impurity may be present in K_2CO_3 or $KHCO_3$ prepared from electrolytic KOH. It has been found in amounts varying from traces up to 0.12% as $KClO_3$. It was detected chiefly in powdered $KHCO_3$ and calcined K_2CO_3 .

Among the less objectionable impurities are the following:

1st. Sulphides. Found in traces in $KHCO_3$ and in calcined K_2CO_3 . Sometimes in appreciable amounts in hydrated K_2CO_3 .

2nd. Nitrites. Found frequently in samples of Japanese (so called) K_2CO_3 in slight amounts.

3rd. Iodides. Found in a number of samples of K_2CO_3 . Possible source Kelp Ash.

4th. Ammonium Salts. Found occasionally in samples of $KHCO_3$, usually in powdered product.

5th. Sodium. Almost always present in amounts varying from traces to as high as 10-12% (as Na_2CO_3) in K_2CO_3 , and from bare traces up to 7% (as $NaHCO_3$) in $KHCO_3$.

Such samples containing less than 99% pure product would of course not conform to the U. S. P.

6th. Sulphates, Chlorides, Phosphates. Frequently present in K_2CO_3 . Chlorides, also, usually present in $KHCO_3$.

7th. Nitrates. Occasionally present in K_2CO_3 .

8th. Iron. Almost always present in both $KHCO_3$ and K_2CO_3 .

9th. Silica and Silicate. Frequently present in K_2CO_3 . Occasionally quite heavy in Japanese K_2CO_3 .

¹ Is blue when washed free from $FeCl_3$.

With the development of new sources of potash, due to shutting off our main supply, there is of course the possibility of additional impurities as well as those previously existing, such as, for example, iodides from potash from kelp ash, nitrites from (so-called) Japanese potash (both mentioned above) and borax in the Searles Lake product.

The Imperial Institute, London, in a bulletin entitled "The World's Supply of Potash," 1915, on page 12, gives the analysis of the salts of Searles Lake brine in California and one of the constituents is Sodium Arsenate, 0.17%. If such is the case there may be possibilities from this source.

The suggested use of Calcium Fluoride in connection with the recovery of Cement Dust Potash may mean the presence of Fluorides in the purified product.

SUMMARY.

From the results of analyses of many samples of potassium carbonate and bicarbonate it seems evident that the following tests should be added to the requirements of the U. S. P.

1st. Suitable tests for Arsenic with limit set for amount allowed.

2nd. Test for Cyanide Compounds.

3rd. Test for Sulphocyanates.

4th. Test for Chlorates.

Tests for sulphides, nitrites, iodides, ammonium salts and other less objectionable impurities mentioned above might be considered advisable.

E. Fullerton Cook: "In making the report of the Committee this year, my only suggestion is with reference to the methods for the next revision. As the work progressed on the U. S. P. IX, we became more and more dependent for conclusions upon personal conferences. Often many decisions were reached in this way in one meeting, which would have required months of correspondence under the usual plan.

I hope that the Committee can point out this advantageous method of conducting the work and would be willing to advocate it as a policy for the next revision."

There is no doubt but that much room for improvement exists as regards methods involved in preparing a revision of the U. S. Pharmacopoeia. A procedure that consumes six years to get out a new revision is entirely too long. The time should be cut in half at least. Various plans for doing this have been suggested. One is, as indicated by Professor Cook, to call together in conference the various members of a sub-committee to consider any vital points involved and determine them by this means rather than by a long, tedious method of correspondence. It has been suggested that a permanent central laboratory, conducted by the Pharmacopoeia committee of revision would materially expedite the work and be productive of excellent results.

Considerable agitation has been abroad relative to the revision being made by the Government. It is held that in view of the fact that the book is the legal standard under the Food and Drugs Act, enforced by Government agencies, the standards should be worked out and promulgated through Government agencies rather than having them delegated to other bodies. Objections obtain relative to this course of procedure because it is believed undesirable to place in the hands of a Governmental Department the formulation of standards of so important a publication as the U. S. Pharmacopoeia represents. Recently a plan has been suggested which endeavors to bridge over the conditions obtaining at present, namely, that the revision be placed in the hands of a committee of five, one from each of the following organizations: The American Pharmaceutical Association, U. S. Department of Commerce, U. S. Treasury Department, U. S. Department of Agriculture and the American Medical Association.

In conclusion the Committee desires to thank all who assisted in the work and regrets exceedingly that the report does not go into greater detail on more subjects.

Respectfully submitted,

L. F. KEBLER, *Chairman*.

REPORT OF THE A. PH. A. COMMITTEE ON MODEL FOR MODERN LAWS PERTAINING TO PHARMACY.*¹

The work of your Committee on Model for Modern Laws Pertaining to Pharmacy has made progress during the year, but it has not been completed. Many suggestions pertaining to detail have been made within the Committee, and also by members of the Voluntary Conference, which, almost without exception, will improve the Preliminary Draft² submitted last year, and most of which will undoubtedly be accepted by the Committee. The more important and newer provisions have been widely discussed in pharmaceutical journals, at State meetings and otherwise, but in the opinion of the Committee they require even further discussion, criticism and suggestion for improvement before they are finally adopted. Some difference of opinion exists with reference to some of the features, which deserve every consideration. It has been decided that as briefly as possible we at this time submit the features upon which there has not been full agreement or regarding which further helpful advice is desired. We solicit the widest discussion on the following proposals contained in the Preliminary Draft:

1st. It is proposed in the Preliminary Draft to place the enforcement of all laws governing pharmacy and the drug business with the State Boards of Pharmacy under the direct supervision of a Drug Commissioner who is to be an appointee of the Board of Pharmacy. It will be noted that this makes the Board of Pharmacy a very powerful institution. Apart from the practical difficulties of enactment which need not be discussed here, the objection is raised that the Board of Pharmacy should be an Examining Board only, and that the enforcement of laws governing the pharmacist and the druggists should rest with other State Departments because other than pharmacists and druggists are also controlled by such laws and for the further reason that the enforcement will be more impartial. Those who favor complete control by a Drug Commissioner under the supervision of the Board of Pharmacy contend that only practical pharmacists can decide upon the correct enforcement of pharmacy and drug laws, and they further contend that the public welfare requires a greater and more general appreciation of the importance of pharmacy which with such intended authority for the Board of Pharmacy is given public expression.

2nd. The authority and standing of the Assistant Pharmacist are much drawn into question. The Preliminary Draft proposes, apart from general education, that an applicant for registration as Assistant Pharmacist should have either two (2) years of practical experience in pharmacy or in the alternative one (1) year of such practical experience and one (1) year of college work, and that he may be in charge of a pharmacy for not more than one (1) day each week. It is proposed that the requirements shall be either two years of practical pharmacy work or two years of college work, and then the far more important proposal is made that the Assistant Pharmacist shall be permitted to conduct a pharmacy without time restriction or limitation so long as a Registered Pharmacist has complete supervision which is not to be measured by the day or the week, but one (1) Registered Pharmacist at least being required for every pharmacy. The argument is advanced, that the Assistant Pharmacist should be given a higher standing with greater rights, this tending to increase the number of assistants, and to decrease the number who desire to conduct pharmacies of their own. In support the contention is made that if an Assistant Pharmacist is qualified to conduct a pharmacy for five (5) minutes, or for a day, he would be qualified to conduct it without any time restriction.

3rd. The Preliminary Draft proposes that the physician, dentist or veterinarian who would compound and dispense his own medicines shall show his qualification to practice pharmacy but would allow those who now are compounding and dispensing their medicines to continue to do so by registration without examination; only those who would newly so engage to be required

* Read before Section on Education and Legislation, A. Ph. A., and the Joint Session with the American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy, Chicago Meeting, 1918.

PH. A., pp. 640 and 1431; Volume V, p. 1360; Volume VI, pp. 29 and 38.—EDITOR.

² See April JOURNAL A. PH. A., pp. 385-393

to take an examination before the Board of Pharmacy in the theory and practice of pharmacy such as Assistant Pharmacists are required to pass. Specific exemption is made for doctors, etc., to provide drugs in cases of emergency which are administered to the patient in their presence. That the physician who would practice pharmacy should show qualification is very generally approved, but the objection is raised that legislation of the kind is unobtainable because of medical opposition. It is urged that organized medicine will never agree that a physician should in any respect be under the control of the Board of Pharmacy. Those who urge the need for such legislation say that the objection in part can be met by having the examination in pharmacy conducted by a Board of Pharmacy member, under the supervision of the Medical Boards. They contend that the needs for public safety should be the only consideration, and that the public through its legislature will be the first to demand such qualification when it learns that it does not now exist.

4th. The Preliminary Draft would accept as a fact that when a person has qualified as a Pharmacist, he remains so until the end of his day. It would do away with term re-registration, and in its place it would provide for the annual registration of all pharmacists. The objection is made that this does not enable the Board of Pharmacy to have accurate information regarding all within the State who are authorized to practice pharmacy, and the objection is further raised that a man, though registered as a Pharmacist, who has not practiced pharmacy for ten or twenty years, should not again be permitted to do so without first proving that he has retained his qualification to act as such.

5th. The Preliminary Draft would positively restrict the distribution at retail of all drugs, medicines and poisons to persons who are registered, either as pharmacists, physicians, dentists or veterinarians and drug dealers, with the sole exception that drugs and poisons intended for agricultural, technical or industrial use, may be sold by others. The objection is raised, that no such exception should be made, and that if it is made, it would throw open the doors again for general distribution by unqualified persons. Having in mind that the intended law provides for the registration of drug dealers in districts where there are no registered pharmacists, the question is, whether such exception with reference to the sale at retail of drugs and poisons for agricultural, technical or industrial use is really necessary for public convenience.

6th. The Preliminary Draft provides a definition for Poisons and for Potent Drugs, and further provides that under the definition it shall be the duty of the Board of Pharmacy to name and publish lists of all poisons and potent drugs, these to include all so-called proprietary medicines which are found to contain what under the law would be a Poison or a Potent Drug, and it is then further provided that all such poison or potent drug content shall be shown on the label in ready-made medicines, and in the case of a physician's prescription either when filled by the pharmacist or when filled by the physician himself, shall be kept in the form of a prescription record, or in the alternative be shown on the label. Possibly no other single provision meets with more strenuous objection on the part of some and with equal strenuous approval on the part of others. Those who object to it say that it means merely a formula disclosure, that it is destructive of property rights and without compensating public benefit; those who favor the provision contend, first of all, that it is primarily for the public welfare. They say that it is frequently desirable and necessary for third persons to know what the active ingredients of a medicine may be. They advance the argument that no physician should be allowed to keep as his sole secret, without possible means of knowledge on the part of third persons, what strong drugs he may have dispensed and, from their point of view, it follows of necessity that no proprietary medicine manufacturer should be allowed to place in the hands of the consuming public what may be the most active of drugs, without some means of third persons knowing, both in case of emergency and in case of the ordinary matter of giving advice. Those who favor this partial formula disclosure contend that it is not destructive of property rights, because method of manufacture and content of non-potent drugs will give sufficient protection against competitive misuse.

We beg at this time to again point out that we understand the mission of this Committee to be the presentation of a Draft which includes what reasonably ought to be a part of up-to-date laws pertaining to pharmacy. We do not believe that we should propose the unattainable, but neither do we believe that we should omit a needed present-day requirement simply because the first impression may be that its legislative enactment can not be secured.

In conclusion we beg to urge upon pharmaceutical journals and upon pharmaceutical conventions, as well as the individual pharmacists, to help us with a free expression of opinion regarding the six proposals which are specially referred to herein, and which we again would briefly state as follows:

1st. Shall the enforcement of all laws governing pharmacy be placed with the State Board of Pharmacy under the direct supervision of a Drug Commissioner?

2nd. Shall the authority and standing of the Assistant Pharmacist as such be materially increased?

3rd. Shall the physician who would practice pharmacy be required to prove his qualification as a pharmacist?

4th. Shall the pharmacist be relieved of re-registration, and shall there be an annual registration of pharmacies?

5th. Is it advisable to provide for an exception under which drugs and poisons for agricultural, technical or industrial use may be sold at retail by unqualified dealers?

6th. Should a modern law include a provision requiring that the poison or potent drug content of ready-made medicines be shown on the label, and that such poison or potent drug content in medicines prepared on physician's prescriptions be evidenced either by a written prescription or by record which the dispensing physician is required to keep?

Respectfully submitted,

REPORT OF THE SPECIAL COMMITTEE ON REGULATIONS FOR TRANSPORTATION OF DRUGS BY MAIL.

Your Committee begs to report that no steps have been taken during the past year by us or by any other organization to enact legislation on the transportation of drugs by mail. The war and conditions arising from it have so overshadowed this subject that quite properly no efforts along this line have been made. The mailing of drugs is still subject, therefore, to the original rulings of the Post Office Department, which depend on laws and regulations that are several years old. They have already been discussed by this Committee and their undesirable features made known to you. Let us continue to devote our full energies to winning the war, returning to the consideration of this subject when victory is ours.

Respectfully submitted,

B. L. MURRAY,

Chairman

REPORT OF THE GENERAL MEMBERSHIP COMMITTEE.

TO THE PRESIDENT AND MEMBERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

The work of the General Membership Committee during the past year has been conducted along the usual lines. Special efforts have been made in Illinois on account of the convention being held in Chicago. In Minnesota, also, Dr. F. J. Wulling and Prof. E. L. Newcomb made a very earnest effort to secure new members which brought excellent results, while New York and Pennsylvania have more than kept up their usual quota of new members.

Although on the whole, the number of new members shows an increase over preceding years, yet a glance over the appended statement will indicate many localities where membership work has lagged. The pressure of the conditions created by the war is largely responsible for this, and it is hoped that with the coming of brighter times a strong impetus will be given to the work of the Membership Committee throughout the country and that the Association may experience a rapid growth.

NEW MEMBERS ELECTED SEPT. 1, 1917, TO SEPT. 1, 1918, AND GROUPED BY STATES AND MEMBERSHIP DISTRICTS.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 2.

(Continued from p. 1009, November issue.)

Motion No. 1. (On Coöperation with Bureau of Public Health Service in re Venereal Diseases among the Armed Forces of the United States): Moved by W. B. Day, seconded by E. G. Eberle, that the above resolutions be adopted.

In the early part of 1918, the Council approved of the selection of a Committee on Research consisting of Messrs. H. V. Army, G. M. Beringer, J. A. Koch, Henry Kraemer, C. H. LaWall, Fred. B. Power, W. L. Scoville, A. B. Stevens, H. M. Whelpley and Edward Kremers.

This committee was a temporary one and went out of existence after it made its report to a recent annual meeting of the Association, at which time it was decided to establish a permanent Committee on Pharmaceutical Research, the following amendments to the by-laws being made:

"That Article I of Chapter X of the By-Laws of the Association be amended by adding 'a Committee on Pharmaceutical Research,' the article to read, 'There shall be appointed or elected standing committees as follows: A Committee on United States Pharmacopoeia, a Committee on Transportation, a Committee on Resolutions, and a Committee on Pharmaceutical Research, each to consist of ten members, etc.'"

"Also that Article XI be added, to read as follows:

"The Committee on Pharmaceutical Research shall be elected by the Council, two members to serve for a term of five years, two for a term of four years, two for a term of three years, two for a term of two years and two for a term of one year, and after the expiration of the one-year term two members shall be elected annually for a term of five years. The Committee on Pharmaceutical Research shall endeavor to promote research along pharmaceutical lines, and shall advise the Council as to the use of the research funds of the Association."

Motion No. 2. (Nominations for Committee on Pharmaceutical Research): Moved by Dr. F. E. Stewart, seconded by E. Fullerton Cook, that the following be nominated as members of the Committee on Research to be elected by the Council: Messrs. H. V. Army, G. M. Beringer, J. A. Koch, Henry Kraemer, Edward Kremers, C. H. LaWall, W. L. Scoville, A. B. Stevens and H. M. Whelpley.

F. B. Power has found it impossible to serve and additional nominations for the committee are asked.

The election will be held later, the two nominees receiving the highest vote will be elected for five year terms, and the next two highest for the four year term, for the three year term, for the two year term and for the first year term, respectively, according to vote.

Please correct the addresses of the following in list given in previous Council Letter (No. 1): [Corrections were made before printing.—EDITOR.]

J. W. ENGLAND, *Secretary*.

415 N. 33rd Street.

A. PH. A. COUNCIL LETTER NO. 3.

PHILADELPHIA, PA., October 8, 1918.

TO THE MEMBERS OF THE COUNCIL:

Motion No. 1. (On Coöperation with Bureau of Public Health Service in re Venereal Diseases among the Armed Forces of the United States) and Motion No. 2 (Nominations for Committee on Pharmaceutical Research) have each received a majority of affirmative votes.

Motion No. 3 (Nomination of George D. Beal for Committee on Research): Moved by George M. Beringer, seconded by E. G. Eberle, that George D. Beal be nominated for the Committee on Research.

Motion No. 4 (Adoption of Recommendation of the Committee on Finance of September 23, 1918): On motion of W. B. Day, seconded by Dr. F. E. Stewart, it is moved that the recommendations of the Committee on Finance of September 23, 1918, contained in Council Letter No. 2, be adopted.

Motion No. 5 (Election of Members): You are requested to vote on the following applications for membership:

- No. 1. Mrs. Bertha Rudolph, 1501 Penn Street, St. Joseph, Mo., rec. by H. M. Whelpley and E. G. Eberle.
- No. 2. Carl Robert Koeble, 333 Jones Avenue, Burlington, N. J., rec. by George M. Beringer, Jr., and Edgar R. Sparks.
- No. 3. Lawrence Zembsch, Asst. Surgeon U. S. Navy, Great Lakes, Ill., c/o Main Hospital, rec. by Wm. B. Day and E. N. Gathercoal.
- No. 4. Percy Newell Hall, 22 Elm Street, Westfield, Mass., rec. by Theodore J. Bradley and John G. Godding.
- No. 5. George H. Haywood, Osakis, Minn., rec. by E. L. Newcomb and Wm. B. Day.
- No. 6. Charles E. Frosst, 17 Forden Avenue, Westmount, Prov. Quebec, rec. by E. F. Kelly and B. Olive Cole.
- No. 7. Joseph B. Clower, Woodstock, Va., rec. by Wm. B. Day and W. F. Rudd.
- No. 8. George P. Engelhard, 536 South Clark Street, Chicago, Ill., rec. by J. W. England and E. G. Eberle.
- No. 9. Palmer L. Foss, Page, N. Dak., rec. by W. P. Porterfield and Wm. B. Day.
- No. 10. Boleslaw Roman Kozlowski, 4800 So. Loomis Street, Chicago, Ill., rec. by Frank J. Dubsky and Wm. B. Day.
- No. 11. Joseph J. Smailis, 1898 Jos. Campau Avenue, Detroit, Mich., rec. by L. A. Seltzer and A. A. Wheeler.
- No. 12. Miguel Sanchez, Media Luna, Oriente, Cuba, rec. by H. M. Whelpley and J. W. England.
- No. 13. Philo LaMont Burrin, c o Eli Lilly & Co., Indianapolis, Ind., rec. by J. E. Seybert and W. B. Day.
- No. 14. John H. Nankivell, Captain 157th U. S. Infantry, A. E. F., rec. by Wm. B. Day and J. W. England.
- No. 15. Theodore Konzelman, 146 Grove Avenue, Highland Park, Mich., rec. by Leonard A. Seltzer and A. A. Wheeler.
- No. 16. Louis Edward Bangert, 1901 Belmont Avenue, Chicago, Ill., rec. by Wm. B. Day and E. N. Gathercoal.
- No. 17. Wallace Joseph Fornhals, 730 W. Madison Street, Ottawa, Ill., rec. by C. W. Lutz and Wm. B. Day.
- No. 18. Hearn Howell Melton, Broad Street, Thomasville, Ga., rec. by R. Thomas and F. V. Eidson.
- No. 19. Richard Harris, 383 W. Main Street, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 20. Patrick A. Roan, 159 E. Main Street, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 21. G. Grobelewski, 241 E. Main Street, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 22. Thos. J. Evans, 79 Center Avenue, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 23. Harry C. Hughes, 15 W. Main Street, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 24. George J. Durbin, 139 E. Main Street, Plymouth, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 25. Fred J. Crandall, 217 Lincoln Street, Wilkes-Barre, Pa., rec. by E. L. Owens and J. D. Morgan.
- No. 26. John J. Shovelin, 691 E. Northampton Street, Wilkes-Barre, Pa., rec. by E. L. Owens and J. D. Morgan.

J. W. ENGLAND,

Secretary.

415 N. 33RD STREET.

A. PH. A. COUNCIL LETTER NO. 4.

PHILADELPHIA, PA., November 5, 1918.

TO THE MEMBERS OF THE COUNCIL:-

Motion No. 3 (Nomination of George D. Beal for Committee on Research), Motion No. 4 (Adoption of Recommendations of the Committee on Finance) and Motion No. 5 (Election of Members; applications Nos. 1 to 37 inclusive) have each received a majority of affirmative votes.

Chairman Hopp has appointed the following committees:

Committee on Conservation: Hugo H. Schaefer, *Chairman*, New York; Theo. J. Bradley, Boston; E. Fullerton Cook, Philadelphia; H. A. B. Dunning, Baltimore; and H. C. Fuller, Washington, D. C.

Advisory Committee for Sailor and Soldier Pharmacists: Frank H. Freericks, *Chairman*, Cincinnati; Clarence O. Bigelow, New York; Edward Spease, Cleveland; H. C. Christensen, Chicago; and Charles E. Caspari, St. Louis.

Committee on Drug Store Classification: Jacob Diner, *Chairman*, New York; E. F. Kelly, Baltimore; Dr. F. E. Stewart, Philadelphia; E. Von Hermann, Chicago; and L. A. Seltzer, Detroit.

General Secretary Day writes:

"I desire to offer the following motion which has the approval of the Finance Committee; Professor Koch seconds the motion:

'Moved that an additional appropriation of \$150 be made for the budget item for the National Drug Trade Conference.

"In explanation, I would say that it has been necessary to hold a second meeting of the Conference and we will of course have to meet the expenses of our delegates. Our present budget item of \$200 is overdrawn thereby."

The above will be known as *Motion No. 6 (Additional Appropriation of \$150 for National Drug Trade Conference)*.

The following nominations for the Committee on Pharmaceutical Research were made in Council Letters Nos. 2 and 3: H. V. Arny, G. M. Beringer, George D. Beal, J. A. Koch, Henry Kraemer, Edward Kremers, C. H. LaWall, W. L. Scoville, A. B. Stevens and Dr. H. M. Whelpley.

The election will now be held (voting card enclosed), the two nominees receiving the highest vote will be elected for five year terms, and the next two highest for the four year term, for the three year term, for the two year term and for the first year term, respectively, according to vote.

Motion No. 7 (Election of Members). You are requested to vote on the following applications for membership:

- No. 38. Louis Gardier, 317 South Main Avenue, Scranton, Pa., rec. by C. H. LaWall and Ivor Griffith.
- No. 39. Julia Runkel, 38 S. Dearborn St., Room 643, 1st Natl. Bank Bldg., Chicago, Ill., rec. by Wm. Gray and Wm. B. Day.

- No. 40. Josephine Marion Dyniewicz, 1535 N. Hamlin Ave., Chicago, Ill., rec. by E. N. Gather-coal and Wm. B. Day.
- No. 41. Hattie Adela Dyniewicz, 1535 N. Hamlin Ave., Chicago, Ill., rec. by E. N. Gather-coal and Wm. B. Day.
- No. 42. Charles F. Godlewski, 1800 West 3rd Street, Chester, Pa., rec. by Charles H. LaWall and E. Fullerton Cook.
- No. 43. Fred D. Hileman, 482 Carey Ave., Wilkes-Barre, Pa., rec. by Jos. D. Morgan and J. W. England.

J. W. ENGLAND.
Secretary.

A. PH. A. COUNCIL LETTER NO. 5.

PHILADELPHIA, November 9, 1918.

TO THE MEMBERS OF THE COUNCIL:

The following communication has been received by the Secretary of the Council from Frank H. Freericks, Chairman of the Advisory Committee for Soldier and Sailor Pharmacists:

"In behalf of the Advisory Committee for Soldier and Sailor Pharmacists, I am directed by unanimous vote of the committee to request from Council authority for the Committee to accept contributions from the drug trade in order that it may properly carry out its work. Will you have the kindness to submit this matter for a vote to Council, if such be necessary. Time is pressing, and we should like much to get our work under way. When this is submitted for a vote, I personally would also ask that Council authorize me to appoint Mr. Clarence O. Bigelow as treasurer, for the committee, or if he, because of other duties cannot serve, that then I be authorized to appoint one of the other members of the committee as its treasurer.

"In order that the members of Council will have a fair understanding of the situation, I am sending you herewith sufficient copies of an explanatory letter, so as to enable you to furnish every Council member with a copy. May I ask of you the very great kindness to submit this matter at once, if you possibly can."

What is the wish of the Council?

J. W. ENGLAND.
Secretary.

415 N. 33RD STREET.

P. S. The following communication has just been received by the Secretary of the Council from James H. Beal:

"I have just had the pleasure of reading the Circular Letter of the Advisory Committee* of the A. Ph. A., for Soldier and Sailor Pharmacists, and I am heartily in favor of the proposed work set forth in the circular, and offer the following motion:

"1st: That the Council approve of the proposed service to Soldier and Sailor Pharmacists, as set forth in the Circular Letter of the Advisory Committee of November 6th.

"2nd: That the Council hereby authorizes the committee to accept contributions for the purpose of carrying on its work.

"3rd: That the committee be authorized to name its own treasurer to have custody of and to disburse the funds so collected."

The above motion will be regarded as *Motion No. 8 (Authorization of Advisory Committee for Soldier and Sailor Pharmacists)*, it is seconded by E. G. Eberle.

J. W. ENGLAND.

* The substance of this Circular Letter will be found elsewhere in this issue.—EDITOR.

A. PH. A. COUNCIL LETTER NO. 6.

PHILADELPHIA, November 26, 1918.

TO THE MEMBERS OF THE COUNCIL:

Motion No. 6 (Additional Appropriation of \$150 for National Drug Trade Conference, Motion No. 7 (Election of Members: applications Nos. 38 to 43, inclusive), Motion No. 8 (Authorization of Advisory Committee for Soldier and Sailor Pharmacists), have each received a majority of affirmative votes.

The following Committee on Pharmaceutical Research (Council Letters Nos. 2 and 3) has been elected: For five year term—H. V. Army and C. H. LaWall; for four year term—Edward Kremers and Julius A. Koch; for three year term—Henry Kraemer and George M. Beringer; for two year term—Wilbur L. Scoville and A. B. Stevens; for one year term—Dr. H. M. Whelpley and George D. Beal.

COMMERCIAL VIBURNUM BARKS AND PREPARATIONS.

In the November issue of *THIS JOURNAL* a paper on "Commercial Viburnum Barks and Preparations" was published, the proof of which, through some misunderstanding, failed to reach me, and, through sickness, did not receive the full attention of my coöperators.

The following corrections are desired: The letters B and C in Fig. 1 should be reversed, so that B refers to the Mercury, and C to the Zinc salt. Mercurous nitrate and not mercuric nitrate, as stated, was used in the microchemical experiments. The following additional references to Rusby and Sayre, considered in the manuscript, but not included in the bibliography, will be of interest:

Sayre, L. E., *Am. J. Pharm.*, 67, 387-94 (1895); 68, 225-32 (1896).

Rusby, H. H., *Jour. New York Botanical Garden*, 155-, (1915).

———, *J. A. PH. A.*, 5, 538 (1916); 6, and especially 6409 (1917).

(Signed) A. VIEHOEVER,

Pharmacognocist, Bureau of Chemistry, U. S. Dept. of Agric.,

Care of Dept. of Chemistry, Urbana, Ill.

THE PHARMACEUTICAL CORPS OF THE JAPANESE ARMY.

The pharmaceutical corps of the Japanese Army does considerable manufacturing of tablets, galenical preparations, and such dressings as experience has taught can not be purchased with safety and from stock that may have been on hand for a more or less indefinite period. Part of the corps is the Medical Supply Bureau, which selects and standardizes materials, appliances and apparatus. The bureau is made up of Major-General Masukichi Hata, chief of the Pharmaceutical Corps and some of the higher pharmaceutical and veterinary officers. The bureau does not include medical officers, however, the pharmaceutical corps is part of the Medical Department, but the pharmacist is quite independent of the medical officer.

RESPONSIBILITY OF DRUGGISTS IN SALE OF REMEDIES FOR SELF-TREATMENT OF VENEREAL DISEASE.

The United States Public Health Service has issued *Venereal Disease Bulletin No. 2*, which probably has reached the members. There is no question that there will be a hearty coöperation of the members with the Surgeon General. The following pledge for signature has been sent out:

PLEDGE.

Appreciating the seriousness of venereal diseases among the armed forces of the United States, as indicated by the reports of the Surgeon General of the United States Army, and desirous of doing whatever is requested by the Government in the war emergency, this store hereby pledges its best efforts in co-operating with the United States Public Health Service and all health officials to reduce the venereal disease scourge among civilians, and specifically does it agree:

1. Not to prescribe or recommend any remedy for a venereal disease.
2. After this date not to purchase a "PROPRIETARY REMEDY" to be sold to

the public for the self-treatment of a venereal disease, and not to sell any such "remedy" after January 15, 1919.

3. To REFILL only such prescriptions for the treatment of venereal disease as were given originally to the customer by a reputable physician who is still in charge of the case.
4. To cause literature furnished by the Surgeon General to be handed to every person asking, without a physician's prescription, for a remedy customarily confined to the treatment of a venereal disease. Further, to direct the applicant to a reputable physician, to a board of health, or to an approved venereal clinic.

The trade of this store numbers approximately people per week.

(Name of Store).....

(By).....

(Street).....

(City and State)

Date 19..

The closing paragraph of the Bulletin reads:

"In directing men and women suffering from venereal diseases along the lines above suggested, druggists of the country will build for themselves a public confidence of great value and at the same time they will know personally that their best efforts are being given toward the elimination of the venereal scourge in their respective communities, both for the best interests of the civilian population and for the greater fighting efficiency of the armed forces of the nation."

The coöperation of the national and state associations has been promised for this effort to eliminate the venereal scourge.

COÖPERATION OF MEDICINE WITH PHARMACY AND CHEMISTRY IS NECESSARY.

That America is the logical country to be the center of medical learning after the war is the opinion of Dr. Frederick Tilney, professor in the College of Physicians and Sur-

geons, Columbia University. After speaking of the changes that had been brought about by the war, the discoveries, and the need of advanced research, he referred to some of the defects in American Medicine. He said:

"The most obvious of these, perhaps, is that we have permitted our vision to become near-sighted and locally introspective. Because of this limited view, we have gained no sense of the possibilities and proportion of our mission; it would even seem that we had no realization of a mission at all. A complacent isolation of the larger medical centers has cultivated an exclusiveness which does not promote mutual understanding or inspire the confidence which engenders the spirit of progress.

"It may be that the first step to secure this end will be a federation of American medical colleges and institutes. A council representative of these institutions would coöperate in the interests of medical education and medical science." * * *

"If the country is to avail itself of the obvious advantages of universal military training after the war, military medicine must be still further developed in the colleges. It seems advisable that permanent courses in military medicine be introduced into the curriculum of medical schools.

"In so large an undertaking the work is not ours alone. The Nation already begins to understand our purposes. When it appreciates the full importance of our relation to its welfare we shall, as a recognized economic necessity, have its liberal support. It is especially necessary in all parts of the country that those who have the interests of medical development in their keeping shall make their efforts decisively constructive."

We are ready to admit the progress medicine has made and the opportunities that lie before it, but the opportunity should be given both to pharmacy and chemistry to coöperate. These are times when related interests should work together for common purposes. At the recent meeting of the New York Section of the American Chemical Society, Dr. Charles H. Herty said: "We are about to enter into a new era for chemistry in this country and the great mass of human energy that has been directed to the destruction of human life is now about to be turned into an agency for its conservation.

"It has been the dream of many prominent chemists in New York and elsewhere to estab-

lish a national institute where the chemist could coöperate with the medical profession and the drug trade in producing compounds for the alleviation of human suffering."

It is realized that along the lines of chemistry there is much yet to be discovered and developed. An institution in charge of the best brains in its respective trade or profession, it was pointed out, would be able to achieve beneficial results.

'There is opportunity and glory' enough for all!

A SHORT-SIGHTED DRUGGIST.

The *Journal of the A. M. A.* comments editorially, under above caption, on the experience and conclusions of a man who bought an N. F. antiseptic for which he paid the price that a related proprietary could be bought for. A comparison of price between the two products justifies the conclusions of the *Journal*, but taken by itself there may be different views relative to the selling price of the article purchased. It must be admitted that there are druggists who do not encourage the dispensing of U. S. P. and N. F. preparations to the extent they should, and such criticism should prove of value. Of course, there are others who are guilty of omissions which might be brought into the discussion, but we will allow the quoted comment to carry a message.

PATRIOTIC PRESCRIPTIONS.

Dr. John J. J. in *Nation's Business* says that now is the time for the American manufacturer to intensify his advertising propaganda of American-made chemicals. No similar expenditure in legitimate advertising will bring such results to the advertiser and to national welfare. "Patriotic prescriptions" may to-day well become a slogan of the medical profession.

May we repeat the request in our editorial, that members induce manufacturers to use the JOURNAL OF THE A. PH. A. for their publicity campaign?

DECIMAL COINAGE IN GREAT BRITAIN.

A decimal coinage bill, providing for a rearrangement of the British money system on a decimal basis, has been introduced in the House of Lords by Lord Southwark. The bill is the result of conferences between two great business organizations, the Institute of

Bankers and the Associated Chambers of Commerce. Both organizations gave their support to the scheme by a unanimous vote.

The bill provides for the continuance of the sovereign and the florin, the latter being one-tenth of the sovereign, or pound. A new coin, one-hundredth of a pound, will make its appearance, being practically equivalent to the American nickel. The new farthing will be worth slightly less than the present farthing (approximately one-half cent), being exactly one-thousandth of a pound. Five farthings (instead of four as now) will make up the new penny.

With such strong endorsement the prospects are bright for the passage of the measure, and once Great Britain has decimal coinage one of the great barriers to decimal weights and measures will have been removed. The decimal movement is not swift, but it seems to possess a most encouraging steadiness in the forward direction, and to enlist in its behalf men of intelligence, merit and sound judgment.—*The Valve World*.

Several of the departments of this Section are omitted from this issue on account of the inclusion of the annual index.

OBITUARY.

CHARLES WESLEY SNOW.

Charles W. Snow, vice-president of Gibson-Snow Drug Company, died at his home in Syracuse, N. Y., November 9, at the age of 82 years. The deceased was born at Peterboro, N. Y.; the parents moved to Syracuse when Charles was five years old and here he

Co., of Albany, and Gibson Drug Company, of Rochester, in the corporation of Gibson-Snow Drug Company, in 1916.

Mr. Snow was financially and officially interested in several banking institutions and other business organizations and identified with many charitable institutions and civic organizations. He was a 33° Mason; for many years a trustee of May Memorial Church, and a director of the Board of Associated Churches and Charities. He is survived by his widow, a daughter, Mrs. Irving S. Merrell, and a son, Nelson P. Snow.

Mr. Snow joined the American Pharmaceutical Association in 1876.

CHARLES FULLER.

Charles Fuller, vice-president of Fuller-Morrison Company, Chicago, died suddenly, of angina pectoris, while on a visit to the home of his father, Honorary President A. Ph. A., Oliver F. Fuller, who had just returned from a visit to New York. Charles Fuller was born in Peekskill, N. Y., August 12, 1868, where he was educated. After graduation from Peekskill Military Academy he went to El Paso, Texas, where he was engaged in the drug business for several years. Thereafter he returned to Chicago and has since been continuously associated in business with his father. Mr. Fuller married Miss Mary Antoinette Hait, of Peekskill, in 1892, who with two sons survive the deceased. Charles Fuller was a member of the American Pharmaceutical Association, of a number of civic and social organizations, among the latter the Chicago Veteran Druggists' Association, of which his aged father is honorary president.

Courtesy of P. O. & D. Reporter
CHARLES W. SNOW.

continued to reside. At the age of 15 years, Mr. Snow entered the employ of W. B. Tobey and four years later was admitted to partnership. In 1866 he established the firm of C. W. Snow & Co., which was continued by the consolidation of this firm with Walker-Gibson

A grandson of Honorary President Oliver F. Fuller, son of Frank F. Fuller, a Lieutenant in the U. S. Aviation Service, in France, was reported among the missing, September 29. We are indebted for these data to Fra. Wilhelm Bodemann, and express the sympathy of the Association to our honored member and family in these bereavements.

LIEUTENANT COLONEL E. F. HARRISON.

Many of our members may not have recognized in the announcement of his death, November 6, by Associated Press, that Lieut. Col. E. F. Harrison, head of the British Chemical Warfare Department, was the distinguished English pharmacist. He joined the British Army as a private in May 1915, and immediately became connected with the chemistry research bureau. He developed the protective apparatus against gas attacks and the whole organization has lately been in his hands. In this work he displayed brilliant resourcefulness. His death, doubtless, was hastened by his devotion to the work he was engaged in. The Council of the British Pharmaceutical Society passed the following resolution, which speaks of some of his activities as pharmacist:

"That this Council receives with profound sorrow the intelligence of the death of Lieut. Colonel E. F. Harrison, F.I.C., C.M.G., one of the most distinguished graduates of the School of Pharmacy, and a brilliant and consistent leader and worker in pharmaceutical and chemical science. As Bell Scholar, prizeman, demonstrator, investigator, examiner, teacher and adviser his career in pharmacy has been characterized by singular and unvarying excellence, and his services to his chosen profession will rank high in the records of pharmaceutical history. The council recalls with pride the immense value of Lieut. Colonel Harrison's knowledge, experience, and organizing ability to the nation at the crisis of its fate, and with mournful satisfaction records the recognition by His Majesty of those ungrudging and invaluable contributions to the defense of the realm. With the passing of this notable pharmacist the Pharmaceutical Society loses a loyal and able leader, his colleagues an honored associate and his friends a staunch and beloved personality."

LIEUTENANT CARL H. HEEBNER.

Aviator Carl H. Heebner, son of Prof. C. F. Heebner, dean of Ontario College of Phar-

macy, and member of the American Pharmaceutical Association, was killed in action and while engaged in battle. Lieutenant Heebner had been shot down three times before the final engagement, but managed on each of these occasions to make his way back to the lines. He was about to be gazetted as captain when he met his untimely end.

HENRY WILSON PEGG.

We have been advised by member John Lohmann, of Kingston, Pa., of the death of Henry W. Pegg. The deceased had been engaged in the drug business with Mr. Lohmann, and he speaks of him as a faithful, honest, conscientious clerk, who had the esteem and friendship of the patrons of the store. Mr. Pegg attended Scio College and later the Pittsburg College of Pharmacy. He joined the American Pharmaceutical Association in 1908.

CLIFFORD O. MILLER.

Clifford O. Miller, chemist of the Maryland State Board of Health, died at his home in Baltimore, October 31, of pneumonia following influenza. The deceased was born in Portsmouth, Ohio, in 1890. He came to Baltimore in 1907 to attend the Maryland College of Pharmacy, from which institution he graduated with high honors, receiving three of the four medals awarded by the college that year.

Dr. Miller became connected with the Maryland State Board of Health in 1913, and had been elected to the faculty of the Maryland College of Pharmacy last summer. He was a member of the Masonic bodies, both in the York and Scottish Rite.

He is survived by his widow, parents and one sister. The deceased joined the American Pharmaceutical Association in 1912.

LOUIS EMANUEL, JR.

Louis Emanuel, Jr., son of Louis Emanuel, member of the American Pharmaceutical Association, died November 4 of pneumonia. The father and mother are frequent attendants of the A. Ph. A. meetings and the former has held membership since 1878.

The deceased was 32 years of age, and was engaged in the drug business at Pittsburg, Pa. He is survived by his parents, wife and a daughter.

The strenuous work and constant attention to serve others during the recent influenza epidemic, exacted a further sacrifice, by death, of many devoted pharmacists.

THE PHARMACIST AND THE LAW.

SECTION 472, POSTAL LAWS AND REGULATIONS.

Sec. 472. 1 All kinds of poison, and all articles and compositions containing poison and all poisonous animals, insects, and reptiles, and explosives of all kinds, and inflammable materials, and infernal machines, and mechanical, chemical, or other devices or compositions which may ignite or explode, and all disease germs or scabs, and all other natural or artificial articles, compositions, or materials of whatever kind which may kill, or in any wise hurt, harm, or injure another, or damage, deface, or otherwise injure the mails or other property, whether sealed as first-class matter or not, are hereby declared to be non-mailable matter, and shall not be conveyed in the mails or delivered from any post-office or station thereof, nor by any letter carrier; but the Postmaster-General may permit the transmission in the mails, under such rules and regulations as he shall prescribe as to preparation and packing, of any articles hereinbefore described which are not outwardly or of their own force dangerous or injurious to life, health, or property: Provided, That all spirituous, vinous, malted, fermented, or other intoxicating liquors of any kind are hereby declared to be non-mailable and shall not be deposited in or carried through the mails. Whoever shall knowingly deposit or cause to be deposited for mailing or delivery, or shall knowingly cause to be delivered by mail according to the direction thereon, or at any place at which it is directed to be delivered by the person to whom it is addressed, anything declared by this section to be non-mailable, unless in accordance with the rules and regulations hereby authorized to be prescribed by the Postmaster-General, shall be fined not more than one thousand dollars, or imprisoned not more than two years, or both; and whoever shall knowingly deposit or cause to be deposited for mailing or delivery, or shall knowingly cause to be delivered by mail according to the direction thereon, or at any place at which it is directed to be delivered by the person to whom it is addressed, anything declared by this section to be non-mailable, whether transmitted in accordance with the rules and regulations authorized to be prescribed by the Postmaster-General or not, with the design, intent, or purpose to kill, or in any wise hurt, harm, or injure another, or damage,

deface, or otherwise injure the mails or other property, shall be fined not more than five thousand dollars, or imprisoned not more than ten years, or both.

2. (a) Spirituous, vinous, malted, fermented, or other intoxicating liquors of any kind, poisons of every kind, and articles and compositions containing poison (except as prescribed in the fourth paragraph hereof), and poisonous animals, insects, and reptiles, corrosive materials, fireworks, and explosives of every kind, and inflammable materials liable to cause fire by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes, and infernal machines, any mechanical, chemical, or other devices or compositions which may ignite or explode, and disease germs or scabs (except as prescribed in Sec. 473), and other natural or artificial articles, compositions, or materials of whatever kind which may kill or in anywise hurt, harm, or injure another, or damage, deface, or otherwise injure the mail or other property, live animals, insects, birds or fowls (except as prescribed in Sec. 473), fresh hides or pelts, or any articles exhaling bad odor, whether sealed as first-class matter or not, shall not be admitted to the mails.

(b) Inflammable liquids and substances, such as paints, varnishes, automobile tire-repair outfits containing rubber cement, etc., that are not liable to cause fire by self-ignition through friction, through absorption of moisture, or through spontaneous chemical changes, and are not poisonous or explosive or unmailable for reasons other than their inflammability, shall be accepted for transmission in the domestic mails, when in quantities of not more than four ounces and when contained in tightly closed metal tubes or cans and packed in strong papier mache tubes or in boxes made of good quality double-faced corrugated pasteboard. The word "inflammable" and the proper name of the article must be plainly marked on the outside of the package.

(c) Substances mentioned in the preceding paragraph (b) when in larger quantities shall be accepted for transmission in the domestic mails when in tight and strong metal containers enclosed in tight and strong outside wooden boxes or cases; provided, that the maximum quantity of any inflammable liquid packed in one outside container must not exceed one

gallon when the flash point is 20° F., or below, and must not exceed five gallons when the flash point is above 20° F., and below 80° F., and the containers must not be entirely filled—not less than two percent of their capacity to be left vacant. The proper name of the inflammable substance contained therein must be plainly marked on the outside of the package and caution labels (red for liquid and yellow for solids) must be attached thereto by the shipper. These caution labels must be diamond-shaped, each side four inches long, with the wording printed in black letters inside of a black-lined border measuring three and a half inches on each side. The wording on the red labels to be "Notice to postal employees. Caution. Keep away from fires, stoves, radiators, lighted matches, lanterns, and direct sunlight. Any leaking package must be removed to a safe place. This is to certify that the above articles are properly described by name and are packed and marked and are in proper condition for transportation according to the regulations prescribed by the Post-Office Department.

....."
(Shipper's name)

The wording on the yellow labels to be "Notice to postal employees. Caution. Keep fire and light away. Sweep up and remove carefully contents of broken packages. This is to certify that the above articles are properly described by name and are packed and marked and are in proper condition for transportation according to the regulations prescribed by the Post-Office Department.

....."
(Shipper's name)

All such parcels to be handled outside of mail bags.

3. Liquids not spirituous, vinous, malted, fermented, or otherwise intoxicating (including samples of altar or communion wine used in church services), and not liable to explosion or spontaneous combustion or ignition by shock or jar, and not inflammable, fruits or vegetable matter liable to decomposition, comb honey, soft soap, pastes or confections, ointments, salves and articles of similar consistency, shall be admitted to the mails for transmission in the domestic mails when enclosed in packages in conformity with the conditions prescribed in Sections 474 and 475.

4. Medicines and anesthetic agents which are not outwardly or of their own force dan-

gerous or injurious to life, health or property and not in themselves unmailable (see Secs. 454 and 480), may be admitted to the mails for transmission in the domestic mails when enclosed in packages in conformity with the conditions prescribed in Section 474: Provided, That the terms "medicines" and "anesthetic agents" shall not be construed to mean poisons. Provided, further, That the article mailed bears the label or superscription of the manufacturer thereof, or dealer therein, or of the licensed physician, surgeon, dentist, or veterinarian preparing or prescribing the same.

DEFINITION OF A "POISON."

Second Assistant Postmaster-General Otto Praeger, in a communication under date of November 23, to Smith, Kline & French Company, of Philadelphia, states:

"You ask what is the definition of a poison within the meaning of the Postal Laws and Regulations, and it is desired to say that any substance which is *required by law or the exercise of ordinary prudence to be labeled 'poison'** is considered to be poisonous and unmailable. Medicines containing cocaine, or more than two grains of opium, or more than one grain of codeine, or more than one-quarter of a grain of morphine, or more than one-eighth of a grain of heroine to the ounce, are considered to be poison and unmailable."

METRIC SYSTEM IN COMMERCE BETWEEN U. S. AND SOUTH AMERICA URGED BY INTERNATIONAL HIGH COMMISSION.

As a means of facilitating and stimulating commerce between the United States and Latin-American countries the use of the metric system is recommended in a resolution adopted by the United States Section of the International High Commission, of which Secretary McAdoo is chairman. The resolution adopted by the commission is as follows:

The United States Section of the International High Commission, having in view the present efforts to bring about the exclusive use of the metric system of weights and measures within the jurisdiction of the United States, resolves:

I. That in the opinion of the section the adoption of that system would be productive

* Italics ours

of great advantage in the commercial relations of the United States with the other American republics.

II. That the secretary of the section be

directed to communicate a copy of a report to the chairmen of the proper committees of the Senate and the House of Representatives.

BOOK NOTICES AND REVIEWS.

A Text-Book of Chemistry.—*Intended for the Use of Pharmaceutical and Medical Students.* By Samuel P. Sadtler, Ph.D., LL.D., Virgil Coblenz, Ph.D., F.C.S., and Jeannot Hostmann, Ph.G. Fifth Edition, revised and rewritten. J. L. Lippincott Company. Philadelphia and London. 765 pages. Price, \$5.50.

The many changes and improvements in manufacturing processes, as well as the almost revolutionary changes in chemical activities, in all directions, brought about by the world war, have made the revision of almost any chemical text a matter of considerable labor.

In order to meet these conditions the present edition of this well-known and popular text-book has therefore been largely rewritten and the book shows a great number of changes. Much new matter has been added and much of that which has become obsolete has been withdrawn.

The changes in Part I devoted to Elementary Physics are particularly noticeable, the entire part having been rewritten by Prof. Jeannot Hostmann, of the Department of Pharmacy, of Columbia University. The matter is clear and concise and covers the field of special interest to pharmacy students well.

The sections on Inorganic Chemistry have been brought up to date by Prof. Virgil Coblenz, who has been in close touch with the manufacturing side of chemistry for a number of years, and therefore specially qualified for this work.

A chapter on electrolysis and its applications, describing many of the latest manufacturing processes now in use, has been added.

The section on Organic Chemistry has been brought up to date, but one is rather disappointed not to find any mention of such substances as the chloramines, dichlorethylsulphide, etc.

The book is especially well adapted to the needs of pharmacists and pharmacy students and will undoubtedly find a large field of usefulness.
